REMARKS ON THE TABLES.

PROMINENCE GIVEN TO LATIN.

The value of Latin as an instrument of mental discipline has been the most prominent subject in the discussions excited by the movement toward the "modern" or "scientific" course. The summarized and comparative statistics of secondary schools (Tables 31, 32, 33, and 34) show very clearly the extent of the demand made upon them for instruction in this branch. To this showing the detailed Tables, viz, 36 and 37, add some suggestive particulars. For instance, it will be seen that the demand for Latin is not confined to a few schools, nor to particular sections of the country. Of the public and partly public schools 88 per cent. report students in the language specified. For the private schools the proportions are 68 per cent. of the schools for girls, 84 per cent. of the schools for boys, and 72 per cent. of the schools for both sexes.

These indications are farther emphasized by comparison with the relative number of each class of schools reporting students in French or German. These proportions are as follows: Of public and partly public schools, 61 per cent. ; of private schools for girls, 75 per cent. ; of private schools for boys, 74 per cent. ; and of private schools for both sexes, 52 per cent.

PHYSICAL CULTURE.

By reference to Column 20, Table 36 ; to the same column, Table 37, Division A ; to Column 23, Table 37, Division B ; and to Column 25, Division C, it will be seen that a large proportion of the secondary schools have answered the inquiry respecting provision for physical culture.

The inquiries as to the system of training and the nature of the appliances were not answered as fully as could have been desired.

Gymnasiums suitably equipped were reported from 13 private schools for girls, 81 private schools for boys, and 57 private schools for both sexes. Military drill is a feature of the training in 26 private schools for boys and in 13 of the schools for both sexes.

REMARKS ON TABLE 37.

The financial statistics presented in Table 37, Divisions A, B, and C, show a general want of endowment funds for the purposes of secondary instruction. Very few reports under this head are made from schools for girls, and the larger proportion of the endowed schools for boys and for both sexes are located in the North Atlantic and the South Atlantic States. It is noticeable, further, that for the most part these endowments date back to an early period of our history.

It is to be feared that the rapid and vigorous development of public high schools has tended to divert the attention of the wealthy patrons of learning from the need of private funds for the same grade of instruction. Private agencies are, however, as necessary as public for its full development. The dignity and independence which ample and permanent resources impart are conditions favorable to sound instruction and effective discipline. Hence, endowed schools like Phillips' Academy and the William Penn Charter School can not be spared from the forces that are to shape public character and develop public intelligence.

Among comparatively recent foundations due to private liberality the McDonogh School is one of the most important and interesting. In the expressed purposes of its founder and the manner in which these have been realized it bears a close analogy to the great endowed schools of England. "In accordance with the will of Mr. McDonogh, the foundation is designed for the education, first, of the poor boys of the city of Baltimore; second, of those of the towns and villages of the State of Maryland; and third, of those from 'the different large cities of the Union.'"

Such has been the growth of the school since its opening in 1872, that a system of appointment, based upon a comparative examination of all applicants, has been found necessary. It is now proposed to extend the opportunities of the school by the admission of a certain number of pay scholars.

ADDENDA TO THE STATISTICS OF SECONDARY INSTRUCTION.

In accordance with the announcement made upon the inquiry forms issued by the Commissioner in preparation for this Report, the tables were closed at an earlier date than in former years as a means of insuring the more timely publication of the matter.

Returns were received from the following schools at a date so near that assigned that it has been possible to present the leading statistics as addenda to Tables 36 and 37.

These statistics are not, however, included in the foregoing discussions nor summaries, excepting only in the general summary, p. 494.

Addenda to statistics of secondary schools.

Plano, Tex.....	Plano Institute.....	{W. F. Mister.....} {T. G. Harris.....}	Non-sect.	7				12,000
Rusk, Tex.....	Rusk Masonic Institute.	B. A. Stafford.....	Non-sect.	4	79	87	157	8,000
Essex, Vt.....	Essex Classical Institute.	Albert G. Cox, A. M.	Non-sect.	4	36	28	64	5,500
Racine, Wis.....	Racine College Gram- mar School.	A. Z. Gray, S. T. D.	P. E.....	11	112		112	120,000

Memoranda for secondary institutions, 1886-87.

Location.	Name.	Remarks.
Colusa, Cal.....	Colusa Commercial and Normal Institute.	Formerly St. Helena's College, removed to Colusa and name changed.
Simsbury, Conn.....	McLean Seminary	Formerly Simsbury Academy.
Washington, D. C.....	St. John's College	Formerly St. John's Collegiate Institute.
Conyers, Ga	Middle Georgia Institute	Formerly Conyers Academy.
Madison, Ga	Select School for Girls.....	Formerly Female High School.
Danville, Ill.....	Danville Wesleyan Seminary and School.	Closed.
Rock Island, Ill.....	Fairview Academy	Closed.
Anamosa, Iowa.....	Jones County Academy.....	School not in session.
Pattersonville, Iowa	Pattersonville Educational Institute...	P. O. changed to Hull, Iowa.
Holton, Kansas	Campbell Normal University and Commercial Institute.	Transferred to universities.
Carrollton, Ky.....	Carroll Seminary	Discontinued.
Catlettsburg, Ky.....	East Kentucky Normal School.....	Removed to Normal, Ky.
Nicholasville, Ky.....	Bethel Academy.....	Removed to Lexington and name changed to Allegan Academy.
Baton Rouge, La.....	Readvilla Seminary.....	Closed.
Baltimore, Md.....	Wilford Boarding and Day School.....	Identical with Miss Bullock's School.
Bowling Green, Mo.....	Bowling Green College	Name changed to Pike County College.
Pleasant Hill, Mo.....	Brannock Collegiate Institute	Closed.
Noligh, Nebr.....	Gates College.....	Transferred to universities.
Silver Ridge, Nebr.....	Silver Ridge Seminary.....	Closed.
East Jaffrey, N. H.....	Conant High School	Closed.
Columbus, N. J.....	Columbus Seminary	Closed.
Hightstown, N. J.....	Hightstown Seminary	Formerly Home Seminary.
Clifton Springs, N. Y.....	Foster School.....	Closed.
Glen Falls, N. Y.....	Glenwood Commercial and Select School.	Name changed and transferred to business colleges.
New York, N. Y. (6 East 45th Street).	Brearley School.....	Formerly Day School for Girls.
Rochester, N. Y.....	Fort Hill School	Removed from Canandaigua.
Archdale, N. C.....	Archdale High School	Formerly Frazier's High School and removed from Bush Hill.
Belmont, N. C.....	St. Mary's College	P. O. formerly Garibaldi.
New Garden, N. C.....	Guilford College.....	Formerly Friends' School.
Reynoldson, N. C.....	Male Institute.....	Closed.
Wilmington, N. C.....	Gregory Institute	Formerly Wilmington Normal School.
Yadkin College, N. C.....	Yadkin High School.....	Formerly Yadkin College.
Butler, Pa.....	Witherspoon Institute.....	Closed.
New Berlin, Pa.....	Union Seminary.....	Name changed to Central Pennsylvania College.
Newport, R. I.....	School of Languages and Art.....	Formerly Family and Day School for Girls.
Dukedom, Tenn.....	Mrs. S. H. Welch High School.....	Removed from Paris, Tenn.
Harrisonburg, Va.....	Shenandoah Normal College	Removed from Middletown, Va.

TABLE 38.—Comparative view of admission requirements in twenty-one representative universities and colleges; based upon the scheme in the *Biennial Report of the President of the University of California, 1886.*—PART I.

Character.	Name of college.	English.	Arithmetic.	Algebra.	Geometry.	History and geography.
1863	<i>University of California</i> , classical course, degree of A. B.	Short composition upon a subject announced at the time of the examination and taken from the following works: School Days at Rugby; Lady of the Lake; Alhambra; New-comers; Merchant of Venice, and Julius Cesar. Analysis of sentences; Kellogg's Rhetoric, 71 lessons.	Including the metric system, technical parts of commercial arithmetic not insisted on.	To quadratic equations.	All of plane geometry, except the metrical properties of regular polygons and the measurement of the circle.	History of the United States, and the general facts of physical and political geography.
	Literary course, degree of B. L. Course in science, degree of B. S.	Same as for classical course.	Same as for classical course.	Same as for classical course. Including quadratic equations.	Same as for classical course. Plane geometry, including the metrical properties of regular polygons, and of the measurement of the circle.	Same as for classical course. Same as for classical course with addition of English history.
1856	<i>Harvard College</i> , A. B.	Short composition upon a subject announced at the time of examination and taken from one or more of the following works: Julius Cesar; Merchant of Venice; Johnson's Lives of Milton and Dryden; Macaulay's Essays on Milton and Dryden; Paradise Lost, Books I-II; Dryden's Alexander's Feast; Queen's Durward; Irving's Bracebridge Hall. Correction of bad English.	Higher arithmetic, including the metric system.	To logarithms in Loomis's Treatise.	Euclid Book I and the first 33 exercises in Todhunter's edition, or the first 4 books in other geometries with the above exercises.	History of Greece and Rome, or history of the United States and of England.
1701	<i>Yale College</i> , A. B.		Including metric system.	Through quadratic equations, including radicals and fractional exponents.	Euclid I and II.	Geography and United States history.
1746	<i>College of New Jersey</i>	Grammar; short essay (in 1887, on the life of Franklin or Scott).	Including metric system.	First 5 chapters of Peck's Manual.	First 4 books of Davies' Legendre.	Geography.
1754	<i>Columbia College</i>	English grammar; composition on subject given at time of examination.	Including metric system.			

TABLE 35.—Comparative view of admission requirements in twenty-one representative universities and colleges, etc.—PART I—Continued.

Character.	Name of college.	English.	Arithmetic.	Algebra.	Geometry.	History and geography.
1755	<i>University of Pennsylvania</i> , classical course, A. B.	Grammar (as in Abbott's <i>How to Parse</i> , or Whitney's <i>Essentials of English Grammar</i>); Abbott's <i>How to Write Clearly</i> ; composition on subject from the last named of the following works (all to be read): Macaulay's <i>England</i> , chap. VII-XII; <i>Marble Faun</i> ; <i>Frontenac Education</i> ; and <i>Marmion</i> . Same as for classical course with addition of etymology. Same as for scientific course.	Including decimal system of weights and measures. Same as for classical course. Same as for classical course. Including metric system	Through quadratic equations. Same as for classical course. Same as for classical course. Through equations of second degree, progression, and binomial formula.	Plane geometry..... Plane and solid geometry. Same as for scientific course. Plane geometry.....	Ancient and modern geography; United States history.
1764	Scientific course, B. S. Ph. B. course..... <i>Brown University</i> , A. B. course.	Brief composition on subject assigned at examination for 1887 from one of the following works: <i>Julius Caesar</i> ; <i>Johnson's Lives of Milton and Dryden</i> ; <i>Paradise Lost</i> , I-II; <i>Alexander's Feast</i> ; <i>Quentin Durward</i> ; <i>Bracebridge Hall</i> . Same as for classical course.	Same as for classical course. Including metric system	Same as for classical course. Through quadratic equations, including radicals.	Same as for classical course. Plane geometry (4 books of Wentworth) including the problems and exercises.	Modern geography; United States history. Same as for scientific course.
1770	Ph. B. course..... <i>Rutgers College</i>	Grammar and spelling; short essay on subject from one of the following: for 1887, <i>King Lear</i> ; <i>School Days at Rugby</i> ; <i>Vicar of Wakefield</i> ; <i>Ode on Immortality</i> . Grammar, orthography, and punctuation; for 1887 the following subjects should be read: <i>Julius Caesar</i> ; <i>The Abbot</i> ; <i>Marmion</i> ; <i>Carlyle's Essay on Burns</i> ; <i>Bracebridge Hall</i> . Short composition on subject taken from one of the following works: <i>Julius Caesar</i> ; <i>Merchant of Venice</i> ; <i>Paradise Lost</i> , I-II; <i>Quentin Durward</i> ; <i>Alexander's Feast</i> ; <i>Bracebridge Hall</i> . Correction of incorrect English; short composition on subject taken from one of the following works: <i>Julius Caesar</i> ; <i>As You Like It</i> ; <i>Paradise Lost</i> , I-II; <i>Quentin Durward</i> ; <i>Snow Bound</i> ; <i>Michael</i> ; <i>Lorna Doone</i> .	Arithmetic..... Including metric system	Through quadratic equations.	Same as for classical course. Plane geometry.....	Geography; United States history.
1791	<i>University of Vermont</i> .			Through quadratic equations.	Plane geometry.....	Ancient and modern geography.
1793	<i>Williams College</i>		Including metric system	Through quadratic equations, including radicals.	Plane geometry.....	Ancient and modern geography.
1825	<i>Amherst College</i>		Including metric system	Through quadratic equations, radicals, and binomial theorem.	Plane geometry.....	

1837	<i>University of Michigan</i> , A. B. course.	Grammatical and rhetorical analysis; short essay on subject taken from the following: Midsummer Night's Dream; Lowell's Biglow Papers; Thackeray's 'The Newcomes.' (Extravagants accepted). Same as for classical course.	Including metric system	Same as for classical course.	Through quadratics, progression, and logarithms.	Plane, solid, and spherical geometry.	Physical geography, ancient and modern political geography; history of the United States to the close of the Revolutionary War. Outline of general history; United States history to close of Revolutionary War. Same as for above B. S. Same as for classical course.
	B. S. in general science, in chemistry, or in biology.	Same as for classical course.	Same as for classical course.	Same as for classical course.	Same as for classical course.	Same as for classical course.	Same as for above B. S. Same as for classical course.
	B. S. in engineering.	Same as for classical course with more English literature.	Same as for classical course.	Same as for classical course.	Same as for classical course.	Same as for classical course.	Same as for above B. S. Same as for classical course.
	Ph. B. course.	Same as for classical course.	Same as for classical course.	Same as for classical course.	Same as for classical course.	Same as for classical course.	Same as for above B. S. Same as for classical course.
	B. L. course.	Same as for classical course with more English literature.	Same as for classical course.	Same as for classical course.	Same as for classical course.	Same as for classical course.	Same as for above B. S. Same as for classical course.
1838	<i>University of Wisconsin</i> , ancient classical course.	Reading, spelling, penmanship, grammar, short composition on subject taken from the following works: Merchant of Venice; Evangeline; Ronold. Same as above.	Arithmetic.	Through quadratics.	Plane geometry.	Physical geography, ancient and modern political geography; history of the United States to the close of the Revolutionary War. Outline of general history; United States history to close of Revolutionary War. Same as for above B. S. Same as for classical course.	Same as for above B. S. Same as for classical course.
	Modern classical course.	Same as above.	Same as above.	Same as above.	Plane geometry.	Physical geography, ancient and modern political geography; history of the United States to the close of the Revolutionary War. Outline of general history; United States history to close of Revolutionary War. Same as for above B. S. Same as for classical course.	Same as for above B. S. Same as for classical course.
	Science course.	Same as for classical course.	Same as for classical course.	Same as for classical course.	Plane and solid geometry.	Physical geography, ancient and modern political geography; history of the United States to the close of the Revolutionary War. Outline of general history; United States history to close of Revolutionary War. Same as for above B. S. Same as for classical course.	Same as for above B. S. Same as for classical course.
	English course.	Same as for classical course.	Same as for classical course.	Same as for classical course.	Same as for science course.	Physical geography, ancient and modern political geography; history of the United States to the close of the Revolutionary War. Outline of general history; United States history to close of Revolutionary War. Same as for above B. S. Same as for classical course.	Same as for above B. S. Same as for classical course.
1858	<i>University of Texas</i> , A. B. course.	Short composition.	Including metric system	Including radicals and quadratics.	Plane geometry, Halsted, 6 books.	Physical geography, ancient and modern political geography; history of the United States to the close of the Revolutionary War. Outline of general history; United States history to close of Revolutionary War. Same as for above B. S. Same as for classical course.	Same as for above B. S. Same as for classical course.
1862	B. S. and B. L. courses.	Same as for A. B. course.	Same as for A. B. course.	Same as for A. B. course.	Same as for A. B. course.	Physical geography, ancient and modern political geography; history of the United States to the close of the Revolutionary War. Outline of general history; United States history to close of Revolutionary War. Same as for above B. S. Same as for classical course.	Same as for above B. S. Same as for classical course.
	<i>Ohio State University</i> .	Rhetoric and composition.	Arithmetic.	Algebra.	Geometry and trigonometry.	Physical geography, ancient and modern political geography; history of the United States to the close of the Revolutionary War. Outline of general history; United States history to close of Revolutionary War. Same as for above B. S. Same as for classical course.	Same as for above B. S. Same as for classical course.
1865	<i>Cornell University</i> , A. B. course.	Grammar; short composition, taken, if desired, from one of the following works: Merchant of Venice; Lady of the Lake; Twice Told Tales; Vision of Sir Launfal. Same as for classical course.	Including metric system	Through quadratics, radicals, and exponents.	Plane geometry; 5 books Chauvenet's Elementary Geometry; or 5 books, Wentworth's P. and S., or an equivalent.	Physical geography, ancient and modern political geography; history of the United States to the close of the Revolutionary War. Outline of general history; United States history to close of Revolutionary War. Same as for above B. S. Same as for classical course.	Same as for above B. S. Same as for classical course.
	Courses in science, science and letters, mathematics, chemistry and physics, and analytical chemistry.	Same as for classical course.	Same as for classical course.	Same as for classical course.	Plane geometry; 5 books Chauvenet's Elementary Geometry; or 5 books, Wentworth's P. and S., or an equivalent.	Physical geography, ancient and modern political geography; history of the United States to the close of the Revolutionary War. Outline of general history; United States history to close of Revolutionary War. Same as for above B. S. Same as for classical course.	Same as for above B. S. Same as for classical course.
	Course in natural history.	Same as for classical course.	Same as for classical course.	Same as for classical course.	Same as for classical course.	Physical geography, ancient and modern political geography; history of the United States to the close of the Revolutionary War. Outline of general history; United States history to close of Revolutionary War. Same as for above B. S. Same as for classical course.	Same as for above B. S. Same as for classical course.
	Courses in literature, philosophy, and history and political science.	Same as for classical course.	Same as for classical course.	Same as for classical course.	As above, and plane trigonometry.	Physical geography, ancient and modern political geography; history of the United States to the close of the Revolutionary War. Outline of general history; United States history to close of Revolutionary War. Same as for above B. S. Same as for classical course.	Same as for above B. S. Same as for classical course.

TABLE 38.—Comparative view of admission requirements in twenty-one representative universities and colleges, etc.—PART I—Continued.

Char- ter.	Name of college.	English.	Arithmetic.	Algebra.	Geometry.	History and geography.
1867	<i>Johns Hopkins University.</i>	English grammar and correct expression; outlines of the history of the English language; short composition.	Including metric system	As in Todhunter, 38 chapters.	Plane and solid geometry; plane trigonometry; analytical geometry.	Physical and political geography; United States history, and English history, or ancient history.
1869	<i>Boston University</i>	Short composition on subject taken from one of the following works: Julius Caesar; Merchant of Venice; Alexander's Feast; Quentin Durward; Paradise Lost, I-II; Bracebridge Hall; Johnson's lives of Milton and Dryden; Macaulay's essays on same.	Including metric system	Including quadratics, radicals, and binomial theorem.	Plane geometry.....
1873	<i>Vanderbilt University.</i>	Grammar and analysis; short composition on subject taken from the following works: Lady of the Lake; Merchant of Venice; Tom Brown at Rugby; Lamb's Tales of Shakespeare.	Including metric system	Including quadratics, radicals, binomial theorem, logarithms.	6 books of Chauvenet or equivalent.	United States history; geography.
1820	<i>University of Alabama,</i> classical course.	Grammar and English composition; short composition on subject taken from one of the following: Anderson's Popular History of the United States; Robinson Crusoe; Vicar of Wakefield.	Arithmetic	Through equations of the second degree.	Geometry, first 2 books	Geography.
1789	Scientific course..... <i>University of North Carolina,</i> classical course. Philosophical course.. Scientific course.....	Same as for classical course..... Grammar, rhetoric, and composition .. Same as for classical course..... Same as for classical course.....	Same as for classical course. Arithmetic	Same as for classical course. To equations of the second degree. Same as for classical course. Same as for classical course.	Same as for classical course.	Same as for classical course.

TABLE 38.—Comparative view of admission requirements in twenty-one representative universities and colleges; based upon the scheme in the *Biennial Report of the President of the University of California, 1886*.—PART II.

Name of college.	Latin.	Greek.	Ancient history.	Science.	Modern languages.
<i>University of California</i>	Cæsar, Gallic War, books I-IV (or Civil War, books I-IV); Cicero, the Four Catilinian Orations, the Orations Pro Archia Poeta and Pro C. Manilio; Æneid, books I-VI; Latin at sight and Latin prose composition; grammar and prosody. Same as for classical course.	Anabasis, I-IV; White's First Lessons in Greek, I-LX; Æneid, I-IV; Jones's Greek Prose Composition, or equivalent; Greek at sight, grammar, archaeology, and prosody.	Greek history to the death of Alexander, with connected geography. Roman history to the death of Commodus, with connected geography.		
<i>B. L. course.</i> <i>Harvard College</i>	Translation at sight of simple prose, with questions on the usual forms and ordinary constructions of the language. Advanced mathematic and physical science may be substituted for either elementary Greek or elementary Latin.	Translation at sight of simple Attic prose, with questions on the usual forms and ordinary constructions of the language. Grammar; composition; Anabasis, 3 books; Æneid, 2 books, with prosody; sight translation of Xenophon.	See history and geography	Any two of the following: physics, elementary chemistry, botany, physiology, mineralogy, plane trigonometry, and free-hand drawing. Same as for literary course Either elements of astronomy and physics, or a course of experiments in the subjects of mechanics, sound, light, heat, and electricity, not less than 40 in number actually performed at school.	German; translation at sight of simple prose. French; translation at sight of ordinary prose.
<i>Yale College</i>	Grammar, Gallic War, I-III; Cicero against Catiline and for Archia; Vergil—Æneides, Æneid I-VI, with prosody; Ovid—Metamorphoses, translation at sight; sight translation of prose; prose composition.	Grammar; composition; Anabasis, 3 books; Æneid, 2 books, with prosody; sight translation of Xenophon.	Roman history as in Creighton's Primer; Greek history as in Smith's or Fyfe's textbook.		Sight translation of easy prose in either French or German.
<i>College of New Jersey</i>	Grammar and prosody; Cæsar, 5 books; Catiline or Jugurtha; Æneid, 6 books; 6 orations of Cicero; composition; ancient geography.	Grammar and prosody; Anabasis, 4 books; Homer, 2 books; Greek composition; ancient geography.			
<i>Columbia College</i>	Grammar and prosody; composition; Cæsar, 5 books; Eclogues and Æneid, 6 books; 6 orations of Cicero.	Grammar and prosody; composition; Anabasis, 4 books; Æneid, 3 books.	As in Rawlinson's Manual of Ancient History.		
<i>University of Pennsylvania</i> , A. B. course.	Grammar; Cæsar, Gallic War, I-III; Æneid, I-VI; Cicero, 5 orations; Arnold's Latin Prose Composition to exercise 21.	Grammar; Arnold's Greek Prose Composition, to exercise 29; Xenophon, Anabasis, I-IV; Æneid, I-III.	Freeman's General Sketch of History, Chapters I-VI.		

TABLE 38.—*Comparative view of admission requirements in twenty-one representative universities and colleges, etc.—PART II—Continued.*

Name of college.	Latin.	Greek.	Ancient history.	Science.	Modern languages.
<i>University of Pennsylvania</i> , B. S. course.	Same as for classical course	Harrison's French Syntax (first 45 exercises); Télémaque, 3 books; German, Ahn's Method (first course, pp. 1-100 and 133-140; second course, pp. 1-64.) Same as for scientific course.
Ph. B. course.....	Same as for classical course.....	Same as for classical course	French, Part I of Whitney's Grammar; Docteur's Otto's Reader, 40 pages (real equivalents will be accepted).
<i>Brown University</i> , A. B. course.	Galic War, I-IV or I-III and Sallust's Catiline; Ovid, 2,500 lines; orations against Catiline and for Archias; Æneid I-VI, or I-V, and Eclogues; sight translation of Caesar, Cicero, Vergil, and Ovid; composition. For course including Latin, same as for classical course. For course omitting classical studies, 5 books of Caesar, or its equivalent in Cicero or in Vergil. Grammar and prosody; Jones's Latin Composition or equivalent; Gallic War, I-IV or I-II and Sallust's Catiline; Æneid, I-VI; 7 orations of Cicero; geography and mythology involved; sight reading.	Grammar; Harkness' First Greek Book; Anabasis, or 5 books of Anabasis and 2 books of Homer; 20 exercises of Arnold's Greek Prose Composition. For course including Greek same as for classical course.	Greek history to the death of Alexander. Roman history and geography to end of Marcus Aurelius's reign.	Same as for classical course.
<i>Rutgers College</i>	Grammar and prosody; Jones's books of Anabasis; Arnold's First Greek Book; Jones's Greek Composition; Æneid, 3 books; subject-matter of above; sight reading; geography and mythology involved; sight reading.	Grammar and prosody; books of Anabasis; Arnold's First Greek Book; Jones's Greek Composition; Æneid, 3 books; subject-matter of above; sight reading; geography and mythology involved; sight reading.	Smith's Smaller History of Rome to time of Empire; Smith's Smaller History of Greece.
<i>University of Vermont</i>	Grammar and prosody; Caesar, 3 books; Cicero, 6 orations and De Amicitia; Æneid, 6 books, and Eclogues; Jones's Latin Prose Composition, 30 lessons. Grammar and composition; Caesar, 4 books; Cicero, 7 orations; Æneid, 8 books and Bucolics; sight reading.	Grammar and prosody; Anabasis, 3 books; Æneid, 2 books; Jones's Greek lessons. Grammar and composition; Anabasis, 4 books; Æneid, 2 books; sight reading.	Roman history to Augustus; Greek history to death of Alexander.
<i>Williams College</i>	Galic War, I-IV; orations against Catiline and for Archias; Æneid, I-VI or I-V and Eclogues; sight translation from Caesar, Cicero, Æneid, and Metamorphoses; composition; grammar, prosody, etc.	Grammar; Jones's Greek Prose, 20 exercises; Anabasis, 4 books; Æneid, 3 books; sight reading.	Greek history to the death of Alexander; Roman history to Augustus.
<i>Amherst College</i>	Greece to the death of Alexander; Rome to the death of Marcus Aurelius, with geography.	Keetels's Elementary French Grammar, or Otto's, Part I.

<i>University of Michigan</i> , A. B. course.	Grammar; prose composition; Caesar, 4 books; Cicero, 6 orations; all of the <i>Zenaid</i> ; all the <i>Eclogues</i> and <i>Georgics</i> may be substituted for the last 6 books of <i>Zenaid</i> ; for the last 4 all the <i>Eclogues</i> ; for the last two, 1, 200 lines of <i>Orvid</i> ; prosody. Jones's First Latin Book; Caesar, 4 books; 1 of Cicero's orations.	Grammar and etymology; Jones's Prose Composition; <i>Anabasis</i> , 3 books.	First three books of Smith's History of Greece, omitting chapters on literature and art; Leighton's History of Rome to accession of Augustus.	
B. S. in general science, in chemistry, or in biology.			One of the following: Chemistry, geology, zoology, and physiology. Also natural philosophy and botany. Any two of the above. Natural philosophy.	French: grammar; reading and translating at sight. Or, German: grammar; reading and translating at sight.
B. S. in engineering	Same as in classical course			Same as for scientific course.
B. L. course. <i>University of Wisconsin</i> , ancient classical course.	Grammar and composition; Caesar, 4 books; Sallust's <i>Cataline</i> ; Cicero, <i>Orations</i> ; <i>Zenaid</i> , 6 books; Latin at sight; prosody.	<i>Anabasis</i> , 3 books; <i>Iliad</i> , 2 books; Jones's Composition.	Leighton's History of Rome to accession of Augustus.	Same as for E. S. course.
Modern classical course. Science course.	Same as above.		Same as above.	German. Sheldon's Short German Course, and 20 lessons of German Reader.
English course. <i>University of Texas</i> , A. B. course.	Grammar; Caesar, any 2 books; Cicero, 3 orations; <i>Zenaid</i> , I-II; elementary composition.	Grammar; <i>Anabasis</i> , 2 books; 2 books Memorabilia; elementary composition.	Same as for classical course.	Same as for science course.
B. S. and B. L. courses. <i>Ohio State University</i>	Caesar, 3 books; Vergil, 5 books; Cicero, 5 orations; grammar and composition.			German may be substituted for Latin.
<i>Cornell University</i> , A. B. course.	Gallie War, 4 books; <i>Eclogues</i> , and 6 books of <i>Zenaid</i> ; Cicero, 6 orations; prosody; Latin at sight; Latin composition.	100 pages of Attic prose and 3 books of Homer; easy Greek at sight, and Greek composition.	Physics; botany.	
Courses in science, science and letters, mathematics, chemistry and physics, and analytical chemistry.				French: grammar; 2 of Bocher's Modern French Plays, and Lacombe's Petite Histoire du Peuple Français. German: <i>Trançais</i> . German: grammar; composition; translation at sight.
Course in natural history.	Grammar; Caesar, 4 books.	<i>Alphabet</i> .		Same as for science courses.

TABLE 33.—Comparative view of admission requirements in twenty-one representative universities and colleges, etc.—PART II.—Continued.

Name of college.	Latin.	Greek.	Ancient history.	Science.	Modern languages.
Courses in literature, philosophy, and history and political science.	Same as for classical course		Same as for classical course.		Either French or German as above, or mathematics.
<i>Johns Hopkins University.</i>	Gallie War, 5 books; Eclogues and 6 books of <i>Zineid</i> ; Ovid; Cicero, 7 orations; Latin at sight; composition; grammar and prosody.	Anabasis, 4 books; <i>Iliad</i> , 4 books; Herodotus, 7th book; grammar, prosody, and composition. (Elective with German and French.)	Greek and Roman history. (Elective with United States and English history).	Elementary physics, chemistry, botany, or physiology.	German and French; elements of one and more advanced work in either. (Elective with Greek.)
<i>Boston University.</i>	Gallie War, I-IV; <i>Zineid</i> , I-VI; Cicero's orations against Catiline and for Archias; sight translation of Caesar, Cicero, Vergil, and Ovid; composition, grammar, prosody, subject matter.	Anabasis, 4 books; sight translation of Xenophon and Homer; prose composition.	Greek history to the death of Alexander. Roman history to the death of Marcus Aurelius. Ancient geography.	Elementary physics as in Stewart's Primer.	Sight translation of easy French prose.
<i>Vanderbilt University.</i>	Grammar; Caesar, 4 books; Vergil, 4 books; Cicero, 4 orations; prose composition.	Etymology; syntax, prose composition; Anabasis, 4 books; <i>Iliad</i> , 2 books; grammar and syntax; Anabasis, 1 or 2 books.			
<i>University of Alabama,</i> classical course.	Grammar and syntax; Cicero's orations; Gallie War, I-III; and <i>Zineid</i> .	Optional Grammar; Anabasis, 3 books; Leighton's or White's Greek exercises. Same as for classical course. (Elective with Latin.)	Ancient history, geography, and mythology.		
Scientific course	Same as for classical course				
<i>University of North Carolina.</i>	Gallie War, I-V; <i>Zineid</i> , I-V; 4 of Cicero's orations; composition.				
Philosophical course	Same as for classical course. (Elective with Greek).				
Scientific course					

TABLE 39.—Comparative view of admission requirements for Freshman class in B. S. course in twelve representative agricultural and mechanical colleges.

Character.	Name of college.	English.	Arithmetic.	Algebra.	Geometry.	Science.
1855	<i>Michigan Agricultural College.</i>	Geography, grammar, reading, spelling, and penmanship.	Arithmetic	Elementary algebra is desirable.
1854	<i>Pennsylvania State College . . .</i>	Grammar; geography, both descriptive and physical; United States history.	Arithmetic	Through quadratics and progressions.	Four books of Wentworth.	Elements of natural philosophy.
1859	<i>Iowa State Agricultural College.</i>	Orthography, grammar, United States history.	Arithmetic	Through simple equations.	Human physiology.
1865	<i>Maine State College of Agriculture and the Mechanic Arts.</i>	Grammar, geography, United States history.	Arithmetic	To quadratic equations.	Geometry, 5 books.
1865	<i>State College of Kentucky</i>	Grammar, composition, geography, and outlines of history.	Ray's Arithmetic, Part III.	Ray's Algebra, Part I.
1871	<i>Agricultural and Mechanical College of Texas.</i>	Grammar, composition, geography.	To proportions
1877	<i>Colorado State Agricultural College.</i>	Grammar, United States history, descriptive and physical geography.	Arithmetic
1863	<i>Massachusetts Agricultural College.</i>	Grammar, geography, United States history.	Including metric system.	To quadratic equations.
1883	<i>Kansas State Agricultural College.</i>	Grammar, geography, spelling.	Including percentage and interest.
1878	<i>Agricultural and Mechanical College of Mississippi.</i>	Grammar, geography, United States history.	Through interest.

¹ Hutchinsonson's Physiology, descriptive botany, and elements of natural philosophy are required in addition to above.

1876	Wellesley College, classical course.	Grammar; rhetoric; composition on subject from one of the following: Julius Caesar, Twelfth Night, Johnson's Lives of Addison and Pope, Bracebridge Hall, Lays of Ancient Rome, Pope's Rape of the Lock and Essay on Criticism, Pride and Prejudice, English Humourists; geography, United States history to close of Revolutionary War; Greek history to Peloponnesian War; of Rome to close of the first century A. D.	Scientific course..	Same as classical course.	Arithmetic, including metric system; algebra, through quadratics, proportions, and progression; plane geometry.	Grammar: prosody; Jones's Exercises in Latin Prose Composition; Caesar, 4 books; Cicero, 7 orations; Aesop, 6 books. Equivalents will be accepted.	Grammar: Jones's Greek Prose Composition; Anabasis, 3 books.	Sauveur's Grammar: Canaries avec des Fleves, Les Contes Merveilleux; 6 of La Fontaine's Fables; 2 of Bucher's College Plays; Herquin's Idiomatique French, and Roulers Translations; Lectures Françaises by A. Colin; and 2 classic plays. (Elective with German.)	Grammar; composition Deutsches Lesebuch; Deutscher Anschauungs-Unterricht für Amerikaner, pp. 1-19, 38-47, 315-322, 20-23, 47-111; Die Schönsten Deutschen Lieder; 5 Volkslieder; 20 Lieder from Stufe, French.)	Grammar; composition Fouque's Undine; Schiller's Wilhelm Tell, or Maria Stuart and Die Piccolomini. (Elective with French and Greek.)
1842	Cincinnati Wesleyan College.	Grammar; geography; physical geography; general history.		Latin grammar, lessons and reader.	Arithmetic; algebra, through quadratics; geometry, 3 books.	Grammar: Caesar, 4 books; Aesop, 6 books; Cicero, 5 orations; Jones's Exercises in Latin Prose Composition.	Grammar; Jones's Exercises in Greek Prose Composition; Anabasis, 3 books. (Elective with French and German.)	Grammar; Duffet's French Method; Sauveur's Exercitien sur la Grammaire; 2 Modern Plays; 12 of La Fontaine's Fables. (Elective with Greek and German.)	Grammar; composition Fouque's Undine; Schiller's Wilhelm Tell, or Maria Stuart and Die Piccolomini. (Elective with French and Greek.)	
1817	Rockford Seminary.	Grammar; political and physical geography; United States history; rhetoric; ancient history.								

CHAPTER IX.

SUPERIOR INSTRUCTION.

I: Institutions for the superior instruction of women—General character—Obstacles to classification—Explanation of Table 42—Admission of women to Columbia College—Summary of statistics of institutions for the superior instruction of women (Table 41)—Statistics of institutions for the superior instruction of women (Table 42)—II: Universities and colleges—The tabular scheme—Universities—Statistics of foundations comprising groups of related faculties, etc. (Table 43)—Statistics of State Universities (Table 44)—Colleges or collegiate departments—Summary of statistics of colleges of liberal arts (Table 45)—Classification of undergraduate students—Comparative statistics of the undergraduate work of colleges (Table 46)—Endowed professorships in Harvard University—Organization of the University of Pennsylvania—Organization of the University of Virginia—The University of Alabama—Organization of Cornell University—Recent building operations—West Virginia University—Notable events in the history of superior instruction—Extracts from college catalogues, etc.—Statistics of colleges of liberal arts (Table 47)—III: Schools of science—Character of the United States land grant schools—Summary of statistics of land grant schools (Table 48)—View of practical work as reported from twenty-five colleges—Percentage of students engaged in field, shop, etc. (Table 49)—Appropriations and benefactions to land grant colleges (Table 50)—Equipment of land grant colleges—Statistics of schools of science endowed with the national land grant (Table 51)—Notes from the catalogues of schools of science not endowed with the national land grant—Summary of statistics of these schools (Table 52)—Statistics of the same (Table 53)—Comparative statistics of attendance upon colleges and scientific schools (Table 54)—Ratio of college attendance to white population in 1857 (Table 55).

I.—INSTITUTIONS FOR THE SUPERIOR INSTRUCTION OF WOMEN.

The institutions providing advanced courses of instruction for women may be divided into two classes; the one including a small number of colleges organized upon the usual plan of the arts colleges; the other a large class of colleges and seminaries most of which make provision for a complete course of instruction, beginning at a very elementary stage and carrying pupils on to graduation.

All the institutions of the former class, and a large proportion of the latter, are authorized by law to confer degrees, and it seems that eventually the fact of such authority, taken in connection with the main purpose of individual institutions as indicated by concentration upon collegiate work or provision for all grades, may afford the basis for a better classification than is now possible.

The information thus far collected by the Office is not sufficiently definite and exact upon several points.

For example, without any apparent change of status certain seminaries have been reported one year as authorized by law to confer degrees and the next as not so authorized. Again, in some cases, when the inquiry as to the authority to confer degrees has been answered in the negative, a statement has been made as to the number and kind of degrees conferred. Moreover, the requirements for degrees, and the significance of the various degrees, are not clearly indicated. The differences in respect to these particulars between the seminaries for women and the colleges for men must be taken into account in considering the relative number of degrees conferred by each. Thus, according to returns received at the Office in 1885-86, the number of women receiving the A. B. degree exceeded the number of men in two States, while in three States the numbers were nearly equal. There is, however, every reason for believing that the number of young men completing the recognized course for A. B. in each of these States excelled the number of women. As to the number of women who avail themselves of the provision for higher education the present information is unsatisfactory, as many seminaries make no distinction between the elementary and the academic departments in reporting the number of their students.

In view of these circumstances the study of the subject of the higher education of women must be extended to the details of the colleges and seminaries engaged in the work before a satisfactory tabulation can be accomplished. This investigation has been commenced; meanwhile the endeavor in the present Report has been simply to preserve in convenient form the principal statistics for the year.

In Table 42, Division A, have been placed three colleges for women in New York, which on account of their relation to the University of the State have heretofore ap-

peared in Table 47, three colleges which, as is well known, are organized and conducted in strict accordance with the plan of the arts colleges, together with the Harvard Annex, whose standards are also definitely fixed.

Division B includes all other institutions reporting under the head of Superior Instruction of Women.

ADMISSION OF WOMEN TO COLUMBIA COLLEGE, NEW YORK.

The following announcement, from the Hand-book of Information of Columbia College, explains in full the arrangements under which women have been admitted to its privileges:

"By a resolution of the trustees of Columbia College adopted June 8, 1883, it was ordered that a course of collegiate study equivalent to the course given to young men in the college should be offered to such women as may desire to avail themselves of it, to be pursued under the general direction of the faculty of the college in accordance with the following principles and regulations:

- "1. That such course of study shall extend over a term of four years.
- "2. That it shall be arranged in groups.
- "3. That of these groups one shall be required for the first two years, and that with it another shall be selected.
- "4. That on the expiration of the first two years all the groups shall become elective.
- "5. That a general and very strict preliminary examination shall be held for admission to the four years' course, and that this examination shall have reference to the course in general, like the examination for entrance into the freshman class in college.
- "6. That, unless under special circumstances, no young woman shall be admitted to such entrance examination before she shall have attained the age of seventeen years.

"7. That every student so admitted shall be entirely free as to where and how to pursue her studies, whether in some school, private or public, or at home, or under the auspices or direction of any association interested in her welfare and advancement, and providing her with the means of education.

"8. That examinations shall be held as often as may be necessary, such examinations to be conducted by officers of the college or their duly appointed representatives, and to be in writing.

"In accordance with these principles a course of collegiate study is offered to women arranged under the following groups:

- "1. English language and literature.
- "2. Modern languages and foreign literature.
- "3. Latin language and literature.
- "4. Greek language and literature.
- "5. Mathematics.
- "6. History and political science.
- "7. Physics, chemistry, and hygiene.
- "8. Natural history, geology, paleontology, botany, and zoölogy.
- "9. Moral and intellectual philosophy.

"The course shall extend over four years, to be known simply as the first, second, third, and fourth.

"No woman shall be admitted to the course before she shall have attained the age of seventeen years, unless in case of extraordinary proficiency, of which the examiners shall be the judges.

"A preliminary examination for entrance shall be held annually at such time and place as shall be agreed upon hereafter. The fee for such preliminary examination shall be \$5.

"Every person having passed the entrance examination shall pursue for the first and second years the first group, viz, English language and literature, and must in addition select at least one more group. At the end of the first year a new selection may be made in place of the group selected at the beginning of that year, and at the end of the second year the entire course is elective.

"The place and manner of pursuing her studies are left to the discretion of each student.

"Examinations shall be held as often as may be necessary; they shall be in writing and conducted by professors or officers of the college, to be appointed by the board of the college, and at such time and place as may be duly appointed. The fee at each examination shall be \$5.

"The degree of bachelor of arts will be conferred on such students as shall have pursued during four years a course of study fully equivalent to that for which the same degree is conferred in the school of arts, and shall have passed all the examinations required.

"Any woman who shall have taken the degree of bachelor of arts in the collegiate course for women may study for higher degrees under the direction of the faculty of the college.

"Women graduates of other colleges in good repute who shall have satisfied the faculty of the college that the course of study for which they have received their degrees is equivalent to that for which similar degrees are conferred in the collegiate course for women, or shall have passed such examination as the faculty may prescribe, may be admitted to higher degrees on the same terms and conditions as are prescribed for the admission of graduates in the collegiate course for women to the same degrees.

"To students not pursuing the full course required for the degree of bachelor of arts, but limiting themselves to one or more courses of inferior range, a certificate of proficiency in the subjects pursued will be given on the satisfactory completion of such course or courses of study, to be signed by the president of the college and the examining professor or professors.

"Special students may be admitted to the collegiate course for women. No entrance examination is required of such students, except such as may be necessary to ascertain whether they are qualified to pursue with profit the special course for which they apply."

II.—UNIVERSITIES AND COLLEGES.

In the tabular scheme employed since 1873 in the reports of this Office, the superior scholastic institutions for men or for both sexes have been divided into three groups, viz, universities and colleges, schools of science, and professional schools. This scheme suffices for about two-thirds of the institutions, but is inadequate for the remainder, owing to their complex organization and the rapid expansion of what are generally termed university features.

The separate presentation of a few of the more comprehensive foundations was made in the Report for 1885-86. This view is extended in the present Report, as will be seen by reference to Tables 43 and 44, the former including foundations comprising "groups of related faculties, colleges, or schools" endowed by private funds, and the latter, State universities. The details of the separate departments, colleges, etc., of these foundations are presented as heretofore in the tables to which they respectively pertain, and are included in the corresponding summaries.

The more thoroughly the general college work of the country is understood, the more clearly will be seen the importance of foundations which are destined to become great centres of the higher learning.

Disciplined minds and steady enthusiasm on the part of students; freedom, devotion, and concentration on the part of professors; libraries; laboratory equipments, full and varied as the forms and forces of nature; the inspiring contact of minds representing diverse formative influences; are the essentials of university life and labor.

The possible number of such seats of learning is limited; they can not exist at all excepting in a condition of public intelligence, and of public and of private liberality which are, or should be, promoted by the smaller colleges and diffused by their agency throughout the land.

It is not pretended that the foundations which have been selected for representation in the tables following are all universities, or even that they all bear the promise of becoming universities, in the special sense of that much-abused term. It is, however, believed that the principle of selection employed is justified by the facts and tendencies as known at present. The foundations comprised in Table 43 illustrate every source from which the material equipments of the highest order of institutions is likely to arise, excepting State or national bounty. All of them have progressed far enough to be judged by their actual work, and nearly all of them have achieved more than national distinction.

The undergraduate work of five of these institutions is carried on in colleges of arts and schools of science having their distinct faculties and students; in three, schools of science have distinct recognition, although the faculties and students are not reported separately from those of the college of arts; in the remaining four, the undergraduates are classified by the subjects or courses of study pursued.

Graduate departments, not professional, are reported from ten of the institutions. Seven of the ten report also professional schools, as do the two that do not report a graduate department.

The graduate students include 7 per cent. and the professional students 50 per cent. of the students of their respective institutions.

Ten of the twelve foundations in question report productive funds amounting in the aggregate to \$24,567,745, which is 34 per cent. of the total productive funds reported for all colleges of liberal arts, schools of science, and professional schools.

The total receipts for the year as reported from ten of the institutions were \$2,474,463, which sum was made up as follows: income from productive funds, 52 per cent.; receipts from tuition fees, 32 per cent.; State appropriations, 1 per cent.; other sources, 15 per cent.

The twenty-four institutions included in Table 44, while differing widely from each other in respect to their present development, have this in common—that they are all State universities.

Fourteen of the universities report graduate students, and seventeen report professional students, the number of the former being 2 per cent., and of the latter 35 per cent., of the students of their respective institutions.

With a single exception all the State universities report their productive funds, the aggregate amount being \$6,881,045.

The total income reported for twenty-three of the universities is \$1,302,042. This amount was made up as follows: income from productive funds, 32 per cent.; receipts from tuition fees, 11 per cent.; from State appropriations, 49 per cent.; from other sources, 8 per cent. Tuition fees, it will be seen, form but a small proportion of the aggregate income; the details show further that in three cases only do they represent a comparatively large part of the individual incomes.

The attendance upon post-graduate courses in the State universities is small as compared with the same in the universities included in Table 43. The number of graduate students in the latter is 55 per cent. of the entire number of such students reported from all colleges and universities.

As regards professional schools, theology has no representation in the State universities, and but four schools, with 272 students, in the universities of Table 43.

The law schools in Table 44 number 14, with 973 students, and in Table 43, 8, with 1,262 students. The number of medical schools in Table 44 is 11, with 969 students, and in Table 43, 9, with 2,412 students. The remaining professional students are distributed in dental, pharmaceutical, and veterinary schools.

The theological students of Table 43 represent 4 per cent. of all such students reported; the attendance upon law schools in both tables, 70 per cent. of all law students reported; and the attendance upon the medical schools, 28 per cent. of the medical students reported for the country at large.

In the report of funds distinction is not generally made between the several schools or departments of universities. So far as that has been done in the case of the universities here tabulated, the fact can be ascertained by reference to the detailed tables, in which the several departments have separate representation.

Comparisons of institutions with respect to their material resources are misleading, unless all the conditions under which their work is maintained can be taken into account. This is true when the institutions considered are in the same country, and doubly so when they are in different countries. At the same time, the knowledge of the resources available or which are deemed necessary for the conduct of higher education in any established seat of learning is always helpful to those charged with the same responsibility elsewhere. Information of this kind is not readily obtained from foreign countries, a circumstance which makes the publication of what is obtained all the more desirable.

In connection with the view here presented of university work and resources in the United States, the following statement respecting the colleges which are comprised in Cambridge University, England, is likely to be suggestive.

It presents the result of the assessment by the Financial Board of the income of the several colleges for the purposes of contribution to the Common University Fund. The source of the information is the Educational Times¹ of July 1, 1888.

The funds which in the original were given in English currency are here converted into dollars.

^a Includes the Missouri School of Mines and Metallurgy at Rolla, Mo.

COLLEGES OR COLLEGIATE DEPARTMENTS.

Table 45 presents the summarized statistics of 361 colleges or collegiate departments. Of these, 248 report distinct preparatory departments with 26,550 students. There are, in addition, 21 colleges known to have preparatory departments, but which have not made separate reports of the same. The total of students in these is 3,507, or less than 9 per cent. of the sum total (viz, 43,474) reported in all collegiate departments.

The value of grounds, buildings, and apparatus is reported from 304 colleges, the amount being \$45,948,778; 206 colleges report productive funds to the amount of \$44,416,188. Of this sum, \$1,136,946 is not included in the reported income from productive funds, viz, \$2,655,081. On the other hand, a very small proportion of the income, viz, \$15,500, is realized from funds not stated.

The comparison of Tables 47 and 48, and the tables of professional schools, viz, 58, 61, and 63, with the one before us, will show that distinction is not always made between the funds of separate departments of the same institution. This is true also of State appropriations (Column 20). The larger proportion, however, of both these amounts is devoted to the service of the undergraduate work. The number of institutions richly endowed is small; only 23, or about 14 per cent. of those reporting the item, have income from funds amounting to \$25,000 or upwards. Of this number, 14 are either State universities or are included in the universities (Table 43), while of the remaining 15 all but 7 comprise one or more professional schools.

The State appropriations reported for the year amount to \$911,124. Of this sum, \$678,907 went to State and Territorial universities, and the balance, \$232,217, was divided between thirteen colleges.

The total income reported from 275 colleges was \$7,475,200. Of this sum, 36 per cent. was derived from productive funds, 26 per cent. from tuition fees, 12 per cent. from State appropriations, and 26 per cent. from all other sources.

The numerical strength of the teaching force and the number and classification of students are shown in Columns 9-14. As an index of power and resources, these numbers must be relatively considered. In a new country, in a sparsely settled or a poor country, a few professors and a small body of eager students may be the sign of high purpose and the promise of large results. In any community a college, small as to the number of its students, but well equipped as to teachers and material resources, is a power which cannot be spared and which cannot be supplied by more imposing institutions.

The full discussion of the statistics in the columns indicated requires a consideration of details that cannot be attempted here; it may be noted, as indicating the lines within which the discussion might be pursued, that 192 of the colleges tabulated report less than 100 collegiate students. Of the remaining 169, there are 145 colleges reporting from 100 to 300 students, 20 from 300 to 500, 3 from 500 to 800, and one above 800.

Comparisons between colleges with respect to the ratio of professors to students are apt to be misleading, since many colleges that report preparatory departments or affiliated professional schools have a combined faculty for all. The number of colleges reporting only college work is less than 20 per cent. of the total number.

The number of endowed professorships tabulated (Column 11, Table 45) emphasizes the need of increased funds for this important purpose. The 421 reported are distributed among 96 colleges. As to their value, which is the matter of chief importance, it is difficult to secure information, although it might naturally be supposed that the published statement would be the means of inducing larger contributions for this purpose. Some idea of the sum necessary to put the highest order of teaching service upon a free and secure footing may be gathered from the statement of the endowment funds¹ of Harvard University, for which the Office is indebted to the president, Dr. C. W. Eliot.

At the request of Dr. Edward Mussey Hartwell, associate in physical training, Johns Hopkins University, an inquiry as to the provision for physical training was included in the form addressed to colleges of arts and sciences. The replies show great variety of provision and widely different views as to the purposes and the importance of the training.

The colleges and universities reporting a gymnasium for the use of students, or military training as a part of their course, or both of these provisions, are presented in the following table:²

¹See p. 667.

²Yale University was accidentally omitted. In his report for 1887 President Dwight calls attention to the movement for the erection of a new gymnasium.

CLASSIFICATION OF UNDERGRADUATE STUDENTS.

Table 46 presents a comparative view of the undergraduate work of the colleges included in this Report.

For the country at large, sixty per cent. of college students are in degree courses, the remainder being classified in normal, business, partial, and special courses. These courses include the majority of students in the South Central and Western Divisions of the country, and have the smallest representation in the North Atlantic Division. The distribution of students among the degree courses is shown in Columns 4, 5, 6, and 7, the last mentioned including students in literary courses leading to the B. L. degree, philosophical leading to B. Ph., and civil engineering courses leading to the degree of B. S. or of C. E. Of degree courses, the classical shows the largest proportion of students, whether regard be had to the entire country or to the several geographical sections.

INFORMATION DERIVED FROM LETTERS AND SPECIAL STATEMENTS CALLED FORTH BY THE CORRESPONDENCE ARISING FROM THE PREPARATION OF THIS REPORT.

Endowed professorships in Harvard University.

Name.	Object.	Amount August 31, 1886.
HARVARD COLLEGE:		
Alford.....	Natural religion, moral philosophy, and civil polity.	\$27,748.64
Boylston.....	Rhetoric and oratory.....	28,337.40

ARNOLD ARBORETUM:		
Arnold ¹	Arboriculture.....	153,299.69

¹ Salary paid from income of Arnold fund.

Making a total of 31 endowed professorships.

In a letter accompanying this statement, Dr. Eliot calls attention to the fact that only three of the professorships here mentioned are completely endowed.

In his report for 1886-87, he notes that the university has received this year gifts and bequests to the amount of more than a million of dollars. This includes the Price Greenleaf bequest of \$630,000, the scholarships and other aid provided for poor students, but which are restricted in their application to undergraduates of the college proper.

ORGANIZATION OF THE UNIVERSITY OF PENNSYLVANIA.

[From letter of Jesse T. Burk, secretary of the University.]

"The college department comprises a department of arts, one of science, a course of philosophy for undergraduates, a course in music, and a department of finance and economy. The one faculty governing and teaching this complex body is not all concerned in the teaching of any one section. Indeed, throughout the university, one professor may belong to and teach in several faculties. * * * So also an endowed chair, of which we have but few, may provide for instruction in several of these united departments. * * * I beg to add a few special statements:

"1. This university receives no State or municipal aid. Its board of trustees fills its own vacancies, and has no other connection with the State than that the Governor is *ex officio* the president.

"2. In addition to the fixed scholarships noted in the report on colleges (2 State and 50 city prizes), there are special grants made of an average of 25 others, privately, at the discretion of the board.

"3. Two commencements are held annually,—1st, that in May, of the medical and dental departments; 2d, that in June of the college (arts, science, finance, philosophy, music), law, and veterinary departments. Honorary degrees may be conferred at either.

"The schools of arts, science, philosophy, finances are in fact one for the first two years, diverging only on entering third or junior year, hence no separate report can be made of income from tuition fees."

ORGANIZATION OF THE UNIVERSITY OF VIRGINIA.

[From letter of Prof. Charles S. Venable, chairman of the faculty.]

"* * * The University of Virginia is a university in the broad sense of the European universities.

"The library is undivided and is as a whole for the institution.

"Neither the law class nor the medicine class have a separate dean. All the students of the institution are on the same footing, and many in the academic departments have also some of the law school or medicine school. We have no separate college of arts or of sciences. Many in scientific departments are also in departments of arts. All of these departments report to one head, the chairman of the faculty.

"Attendance is required of all students in any and every department, and all are subject to daily examination in portion of subject assigned.

"As requested I send several catalogues and sketches. You see all of the students are catalogued together."

THE UNIVERSITY OF ALABAMA.

The material resources of the University of Alabama have been greatly improved during the year by the completion of the new university building. The work fitly closes a series of efforts that form an interesting chapter in the educational record of the last decade. In 1875 the university was placed under the control of a board of trustees nominated by the Governor and approved by the Senate of the State. They found the university in a prostrate condition and applied themselves to the difficult task of restoring its prestige. Their first endeavor was to clear up the accounts and place the funds upon a sound basis. This was so successfully accomplished that since 1876-77 it has been possible to obtain, whenever desired, an accurate knowledge of the university finances. Then followed the revision of the rules and regulations affecting the internal discipline and the conduct of studies. The result is seen in the elevated tone of the university life, in the advancement of its scholastic standards and its consequent increase in numbers and influence.

It remained to secure proper housing for the revived institution. The need in this respect is indicated by a statement in the report of the trustees for 1881-82. "The building now in use," they say, "is only the rear portion and a part of the two sides of the structure as originally planned, was not constructed or adapted for many of the uses to which it is now put, and its use, except as barracks, messroom, and recitation rooms, was only a makeshift until the building could be completed."

In their appeals to the General Assembly for the appropriation of a building fund the trustees simply sought justice, the State being debtor to the university for large sums on account of the proceeds of the sale of the "university lands." Such, how-

ever, was the condition of the State finances that no appropriation for the purpose was possible until 1884, in which year \$60,000 were allowed. Since that time the work has been steadily pushed to its completion.

The buildings erected comprise 4 halls, inclosing a quadrangle or court 230 by 250 feet, from the centre of which a sentinel on duty commands a view of all the rooms.

Clark Hall, the central building on the south side, which is the front of the quadrangle, is a handsome structure of brick and gray limestone, and is appropriated to general academic uses. It is three stories in height, and has a front of 60 feet and a depth of 100 feet. The first story contains the library and reading rooms, and the chapel. The great public hall of the university occupies the second and third stories. This hall will seat with comfort 800 people on the first floor, with accommodations for several hundred more in the galleries. An extensive laboratory has also just been completed.

In its organization the University of Alabama comprises two departments, the academic and professional. The former consists of eleven schools, the studies of which are so arranged as to form four separate and complete courses, as follows: (1) The classical course; (2) the scientific course; (3) the civil engineering course; (4) the mining engineering course.

"A suitable degree is conferred upon students, who complete the studies in either of these courses."

Military training is a feature of the academic department, which has attracted much attention especially since the interstate drill for cadets held at New Orleans in 1885, on which occasion the prize was won by the university students.

The law department organized in 1873 embraces: (1) The school of internal and constitutional law; (2) the school of common and statute law; (3) the school of equity jurisprudence.

This course may be completed in one scholastic year and leads to the degree of bachelor of laws, which entitles the recipient to practice law in all the courts of law and equity in this State.

The progress of the university here outlined is emphasized by the statistics reported to this Office. As compared with 1875 the number of professors has increased from 10 to 15, the number of students from 75 to 212, and the volumes in the library from 4,000 to 7,115.

Moreover, the statistics for the years between 1875 and 1886-87 show that the increase has been steady during the period.

CORNELL UNIVERSITY — ORGANIZATION, RECENT BUILDING OPERATIONS.

[From letter of C. H. Thurber, secretary of the university, and special documents.]

"The only division recognized in the university is that according to courses of study. This division on broad lines is between general and technical courses. Among the latter are included courses in agriculture, mechanical engineering, civil engineering, architecture, etc. But the students in these various courses are all classified together; they have the same instructors so far as they have the same branches of study; they recite in the same classes, they are subject to the same discipline, and are in no way separated, except by the fact of the difference in courses. All students in mechanical engineering must take shop work during the whole four years of the course; all agricultural students must take practical work in the field, and so on. There are always a considerable number taking this work who are not required to take it."

From an analysis of the statistics reported to this Office it appears that the 743 classified students reported for 1886-87 were distributed among the courses of study as follows: 4 per cent. in agriculture; 15 per cent. in civil engineering; 15 per cent. in mechanical engineering; 8 per cent. in electrical engineering; 6 per cent. in architecture; 1 per cent. in chemistry; 8 per cent. in science (including 3 students in preparatory medical); 11 per cent. in letters; 6 per cent. in arts; 8 per cent. in philosophy, and 18 per cent. in special or partial courses.

The chemical and physical building was opened for occupancy in September, 1883. The rooms of the physical department occupy the first floor and the basement. The second and third floors are occupied by the chemical department. The building contains, in addition to the amply equipped laboratories, two large lecture rooms. A fire-proof one-story annex, built of brick, was erected north of the chemical and physical building during the year 1886-87, for the further extension of the work of the chemical department. It contains the laboratories of organic chemistry and assaying, with the necessary balance rooms and store room.

The unexpectedly large attendance of students at the beginning of the year at Sibley College made it immediately apparent that the room would soon be inadequate to the accommodation of the new classes. The director reported that another class as large as the one entering in the fall of 1886-87 could not possibly be accommodated. The matter having been brought before Mr. Sibley, he added to his already generous gifts to the university a sum sufficient for the building and equipment

of the required extension. The Sibley College extension, now nearly completed, is 150 feet long, 40 feet wide, and 2 stories high. The whole upper floor is devoted to drawing, and the rooms are fitted with improved drawing desks. The lower floor is divided by a transverse hall, at the right side of which is a large room in which are placed all the testing machines for use in investigating the strength and other properties of the materials used in mechanical engineering and construction. At the extreme right of the building are a room for an instructor and for the use of students working up their data, and another room for special research. At the left of the hall is a group of rooms devoted to tests of engines, steam pumps, and various motors, which will be set up permanently, and to the temporary mounting of small motors sent in for test. At the extreme west end of this floor are the boiler room and a room devoted to calorimetric investigations.

A noteworthy addition to the material equipment of the university made in the course of the year has been the gift by ex-President White of his library of history and political science. This remarkable collection of books, brought together as the result of very careful study and observation, and consisting of about 30,000 volumes, is doubtless, in many respects, the most valuable private historical library ever collected in this country.

WEST VIRGINIA UNIVERSITY—NEEDS OF AGRICULTURAL DEPARTMENT.

[From letter of E. M. Turner, president.]

"You will observe from my report in the blank relating to the agricultural department, that we are very weak in that line. The truth is that very little attention is paid to this department by the Legislature, or by the board of regents, owing to the following facts: (1) Our people are not a farming people in the sense of tilling, though there is marked advance in that department of agricultural work in the recent past; our principal business is raising stock, horses, sheep, cattle, etc. Experiments in the feeding and breeding of animals are expensive, and they have never been undertaken by the university. (2) We have no college farm, and have never had a practical agriculturist connected with the institution. (3) The fund of the university arising from the land grant amounts to only about \$90,000, which is invested in United States bonds. The Legislature appropriates about \$20,000 annually for the support of the university.

"If the Hatch bill, passed last winter, should be perfected and the scope of it modified so as to include the class of agricultural industry in which our people are mainly interested, I have no doubt the Legislature will at its next session provide a suitable farm and buildings, for an experiment station in connection with the university. I may say, in a general way, that educational work, in all departments, in West Virginia, is in a crude condition owing to the history of our State and its undeveloped condition. A large part of the State was the prey of both armies during the War, and the cost of building public edifices has been a great tax, as also the inception and development of a State system of schools. There has really been nothing left for higher educational or technical or industrial education. The State also received a very small share of the land grant scrip for agricultural colleges, and what was received was very improvidently disposed of by the Legislature.

"Taking all these matters into consideration, I think the State is to be congratulated on the condition of its educational system. We are now engaged in trying to encourage the establishment of local high schools and academies; so as to give the youth of the State the advantages of preparatory training at home, and thus make it easier for them to bear the cost of the college course.

"I trust that these explanations may account for the meagre report I make of our agricultural department. I am very anxious to develop this part of our work, but see no prospect of our being able to do so in the present condition of our finances."

MEMORABLE EVENTS OF THE YEAR.

The year has been made memorable in the history of superior instruction by the following events:

The University of Michigan celebrated the completion of its first half century in June, 1887.

On Wednesday, the 13th of April, 1887, Columbia College commemorated the one hundredth anniversary of the revival and confirmation by the Legislature of the State of New York of the royal charter granted in 1754.

The two hundred and fiftieth anniversary of the founding of Harvard College was celebrated from the 5th to the 8th of November, 1886.

As usual the current college catalogues and the reports of presidents contain valuable information and suggestive discussions relative to superior instruction. Much of this material is reserved for use in the treatment of special topics which are being investigated in the Office. This is particularly the case with matter bearing upon the development of college courses in English language and literature and the increasing provision for the study of the history and civil polity of our own country—

subjects with reference to which there is great activity in all classes of superior institutions.

In the present Report extracts from the catalogues have been for the most part limited to accounts of the increase in material resources and building operations, which have been a noticeable feature of the current record.

NOTES FROM COLLEGE CATALOGUES.

CALIFORNIA.

University of California—Lick Observatory.—During the year covered by this Report great advance has been made toward the completion of the buildings of the Lick Observatory. The glass discs for the 36-inch objective, cast by M. Fell, in Paris, and figured by Alvau Clark & Sons, have been safely stored at the observatory. If the necessary glass for a photographic corrector (36 inches in aperture) can be obtained, it is the intention of the Lick trustees to order the same to be made.

If no unforeseen accident occurs, the observatory will be delivered, completed, to the University of California before the close of 1887.

St. Ignatius College.—The scientific department of St. Ignatius College, San Francisco, has attained a high degree of efficiency. It is provided with commodious quarters, comprising lecture rooms for physics and chemistry, a chemical laboratory, and an extensive cabinet of physics, rooms for qualitative and quantitative analysis, engineering, with magneto-electric machines, battery rooms, complete telegraphic stations, rooms for preparations, balances, spectroscopic studies, and other scientific experiments and investigations, museums of mineralogy, geology, and collections of natural objects and curiosities of different kinds, and it is furnished with a very large and choice collection of philosophical and chemical apparatus. Among recent additions are a large improved electrical machine, and a modern dynamo-electric generator to supply fifteen large arc lights, and above one hundred incandescent lamps, designed to illustrate all the most recent improvements in electric lighting, electro-motion, etc.

The Santa Clara College, at Santa Clara, has a well-equipped scientific department and special facilities for practical training, among which is a printing office furnished with two steam presses and all the necessary appendages of a complete establishment for job and book work.

COLORADO.

University of Denver.—During the year steps have been taken towards securing a large permanent endowment for this university. Nearly 500 acres of land have been obtained on an elevation overlooking the city. Here a town site has been laid out with over 2,500 lots, including a large campus for the university. One quarter of each block in this town is to be retained in perpetuity for the endowment of the institution, while the proceeds of the sales of the remainder are to be devoted to other purposes in the discretion of the board of trustees. With this plan it is believed that the university has a prospective endowment which will insure its success.

CONNECTICUT.

Trinity College reports a building in progress to contain a gymnasium and a public hall. It will be ready for occupation before the close of the year. The cost will be nearly \$35,000, a large part of which was provided by special contributions of alumni and friends of the college.

Yale University.—The designation Yale University, which was officially authorized by the corporation of Yale College soon after President Dwight's accession, has been legalized by an act of the General Assembly of the State, passed in March, 1887. In December, 1886, the university suffered a great loss in the sudden death of Mr. Henry C. Kingsley, who had served as its treasurer for nearly 25 years. Under his wise and prudent management the invested funds had increased from less than seven hundred thousand dollars to considerably over two millions. Among the gifts recorded in 1887 is \$100,000 from Hon. Simeon B. Chittenden, of Brooklyn, N. Y., for an enlargement of the university library.

GEORGIA.

The School of Technology, Emory College, Oxford, Ga., was opened in October, 1884. By gifts from friends interested in industrial education, North and South, its facilities for practice and instruction have rapidly increased, until at present it represents in buildings and appliances an investment of \$10,000.

INDIANA.

DePauw University, Greencastle, Ind., celebrates its semi-centennial during the present year, having been chartered January 10, 1837. The progress of the university is thus summed up in the catalogue for 1887: "At the beginning it did not own a foot

of land; now its grounds embrace 150 acres. From a small rented building of but 2 rooms it now has 9 edifices, most of them among the best devoted to the purposes of education anywhere. From a faculty of 4 members its present staff of instruction comprises 41 professors and teachers, besides occasional lecturers, with libraries, physical, chemical, and biological laboratories, and all the appliances of first-class instruction. Beginning with 85 students, mostly from the immediate neighborhood, its attendance now reaches 843, and from nearly all parts of the world."

Through the liberality of the late Hon. W. C. De Pauw, and the coöperation of the citizens of Greencastle and of Putnam County, and of the Indiana Methodist Conferences, a large endowment fund was assured to the university in 1884, and the name changed from Indiana Asbury to De Pauw. By means of this endowment, tuition has been made free in nearly all departments.

Earlham College, Richmond, Ind., has received from Mordecai Parry the gift of a science hall, now in process of erection. It is to be 35 by 56 feet, and will contain large and well-equipped chemical and physical laboratories, a lecture-room, apparatus room, etc. A new college building is also in process of erection, which will greatly increase the capacity of the institution.

ILLINOIS.

North-western University, at Evanston, reports the completion of a new memorial hall. It contains a large chapel library, and reading-room, six lecture-rooms, several private rooms for professors, and a fire-proof vault for the valuable books and papers. It is built of pressed brick, stone, and terra cotta, and is a very beautiful and commodious structure. In the chapel are to be several fine memorial windows.

Augustana College, at Rock Island, reports a memorial hall now in progress of erection. The building is under roof, but for want of necessary funds its completion has been delayed. It will contain the library, the museum, the apparatus, the conservatory, the recitation-rooms, and the assembly hall.

The semicentennial of *Knox College*, Galesburg, was celebrated June 9, 1887.

IOWA.

Cornell College, Mt. Vernon, Iowa, has added a building for the accommodation of young women. It provides rooms for about one hundred students. The privileges of the dining hall are not confined to those who live in the building.

Tabor College, Tabor, Iowa, reports a new building containing 17 rooms for offices and recitations, together with rooms for the library, art department, etc. The building has been erected by the gifts of 245 persons and is finished free of debt.

Western College, Toledo, Iowa, reports its main building completed and a hall in process of erection for the accommodation of young women.

KANSAS.

University of Kansas.—In 1885 the Legislature of Kansas appropriated \$50,000 for the erection of a building for the department of natural history of the University of Kansas. The building was completed and formally dedicated November 16, 1886. Its museums are designed to make complete display of the material illustrative of botany, zoölogy, and geology, in which the university is particularly rich. The laboratories are so related to the cabinets as to secure the utmost convenience.

Washburn College, Topeka, Kans., reports the completion of two buildings during the year, viz, Boswell Memorial Library, erected at a cost of \$20,000, and the Hallbrook Hall for young women, at a cost of \$10,000.

The College of Emporia, reports a new college building sufficiently completed to be available for use during the present year. It is named Stuart Hall, as a memorial of Mrs. Robert Stuart, of New York City, who, by a gift of \$10,000, contributed largely to its erection.

LOUISIANA.

Southern University, the Louisiana State University for the colored people, has just secured a special appropriation of \$14,000 from the Legislature for the completion of the new university building.

MARYLAND.

Johns Hopkins University.—In his report for 1886-87 Dr. Gilman, president of Johns Hopkins University, gives the following summary of progress during the year: The number of teachers has been slightly enlarged; the number of students has considerably increased; a new department of instruction, pathology, has been initiated; a

physical laboratory, the largest and costliest building yet erected for the university, has been completed and occupied; a building has been set apart for the petrographical laboratory; an astronomical observatory for the instruction of students has been equipped; and a new fellowship has been founded by the gift of a generous individual.

The laboratory is a brick building, with sandstone facings, and its exterior dimensions are 117 feet by 71½ feet. The cost of the structure, including the land, furniture, gas-fitting, steam-heating, steam power, and astronomical dome (but not including large amounts previously paid for instruments and apparatus, and not including the dynamos nor the telescope), was \$174,765.86.

MASSACHUSETTS.

Boston University reports within the past year the erection of a new hall for the school of theology at an expense of about \$150,000.

Williams College.—Dr. Franklin Carter, president of Williams College, in his report for 1886 calls attention to the new gymnasium recently completed at a cost of about \$50,000. The athletic field, the cost of which, including the drainage, has amounted to \$5,000, came into use in the spring of 1886.

Clark University.—The corporation of Clark University, Worcester, Mass., was organized May 4, 1887. It takes its name from the gentleman through whose liberality it has been founded, Mr. Jonas G. Clark, of Hubbardstown, whose gifts for the purpose are as follows:

For the general working or construction fund, to be applied to the erection and equipment of buildings, \$300,000; for a library fund, the income only to be used, \$100,000; for a university fund, the income to be devoted to the general uses of the institution, \$600,000; real estate, library, and works of art of an estimated value of \$500,000. Mr. Clark also proposes to give a further sum of \$500,000 for the maintenance of three professorships in the university, provided other person or persons, before July 1, 1889, shall pledge an equal amount for a like purpose.

MISSOURI.

From the report of the *University of Missouri* for the current year it appears that the General Assembly of the State at its last session appropriated the sum of \$20,000 for the erection of club-houses for students, and \$24,750 for the erection of a barn, vaccine laboratories, cottages, sheds, and other needed improvements, and for the purchase of stock for the agricultural college farm. This is the first appropriation ever made for the farm.

NORTH CAROLINA.

University of North Carolina.—President Kemp P. Battle, in his report for 1886-87, notes the completion of a new laboratory.

OHIO.

Bucktel College, at Akron, reports the erection of a new gymnasium, to be called the Crouse Gymnasium in honor of one of the donors to the fund.

Oberlin College has nearly completed a new building, Peters Hall. It contains class rooms, rooms for physical laboratory, a large audience room, etc. The only part remaining unfinished is the astronomical observatory. The cost of the work thus far, exclusive of furniture and some extras, is \$68,000.

PENNSYLVANIA.

Bucknell University, at Lewisburg, reports the erection and equipment of a first-class astronomical observatory, the gift of Mr. William Bucknell.

Westminster College, at New Wilmington, reports the erection of a building to be used as a conservatory of music and a ladies' hall. It contains private rooms for the accommodation of fifty ladies, also parlors, library, and music rooms, all fitted up in such a manner as to render them both comfortable and attractive.

THE AMERICAN SCHOOL OF CLASSICAL STUDY AT ATHENS

The American School of Classical Studies at Athens has just closed its fifth year of work with increased numbers and with every prospect of increasing usefulness. The government of Greece has taken a warm interest in the enterprise, and by a royal edict, issued July 25, 1886, presented a valuable piece of land on Mount Lycabettus, about an acre and a half in extent, and of the estimated value of \$13,000, as a site for the school. Through the liberality of friends in America means were supplied to build and furnish a house, which will be ready for occupation in October, 1887. The number of students during the year 1886-87 was ten.

The following are the colleges co-operating in the maintenance of the school: Amherst College, Brown University, College of the City of New York, College of New Jersey, Columbia College, Cornell University, Dartmouth College, Harvard University, Johns Hopkins University, University of the City of New York, University of Michigan, University of Missouri, University of Pennsylvania, University of Virginia, Wesleyan University, Wellesley College, Williams College, Yale University.

List of universities and colleges from which no information has been received.

Location.	Name.	Location.	Name.
San Francisco, Cal....	St. Mary's College.	South Orange, N. J. . .	Seton Hall College.
Carlinville, Ill.	Blackburn University.	Brooklyn, N. Y.	St. John's College.
Terre Haute, Ind.	St. Bonaventure's College.	Salisbury, N. C.	Livingston College.
New Liberty, Ky.	Concord College.	La Grande, Oreg.	Blue Mountain University.
Baltimore, Md.	Loyola College.	Loretto, Pa.	St. Francis College.
Worcester, Mass.	College of the Holy Cross.	Philadelphia, Pa.	St. Joseph's College.
Sedalia, Mo.	Sedalia University.	Winchester, Tenn.	Winchester Normal.
Nebraska City, Nebr.	Nebraska College.	Galveston, Tex.	St. Mary's University.

Memoranda to Table 47.

Location.	Name.	Remarks.
Fayetteville, Ark.	Arkansas Industrial University.	Reported with agricultural colleges. (See Table 51.)
Newark, Del.	Delaware College.	Reported with agricultural colleges. (See Table 51.)
Chicago, Ill.	University of Chicago.	Suspended September 7, 1886.
Urbana, Ill.	University of Illinois.	Reported with agricultural colleges. (See Table 51.)
Greenwood, Mo.	Lincoln College.	Suspended until 1887.
Stewartsville, Mo.	Stewartsville College.	Building burned and college closed.
Ithaca, N. Y.	Cornell University.	Reported with agricultural colleges. (See Table 51.)
Independence, Tex.	Baylor University.	Removed to Waco, Tex., and consolidated with Waco University, under the name of Baylor University.

III.—SCHOOLS OF SCIENCE.

The number of institutions in the United States sharing in the benefit of the land grant of 1862 is 48.

In 13 States the grant was made over to universities or colleges already existing, and has served to establish or to augment the funds of courses, departments, or schools of applied science in the same. In the 25 remaining States the fund has served as the chief source of endowment for new institutions, or as the nucleus around which have collected additional funds, in several cases far exceeding the amount derived from the national grant. In 6 States the grant has been divided. In Georgia it has been applied to the endowment of 6 colleges of agriculture affiliated to the State University; in Massachusetts separate colleges, one of agriculture, the other of the mechanic arts, have been the recipients; in Missouri a portion of the grant has been applied to the endowment of an "agricultural and mechanical college" and the rest to the endowment of a "school of mines and metallurgy," both under the auspices of the University of Missouri; in Mississippi, South Carolina, and Virginia the fund has been divided between institutions for white and colored students, respectively.

Certain of the schools have developed particularly in the direction of the mechanical arts; others are agricultural colleges, pure and simple; a few combine both departments, with large provision for theoretic instruction, while some differ in no essential particular from the ordinary classical college.

Under these circumstances it is difficult, and as time passes it must become more and more difficult, to group in a single table institutions which have shared in this national benefaction. In the present Report, 33 of these institutions are included together in Table 51. The statistics of the remaining 15 are included in Table 47. For convenience of reference, a list of these is appended to the table before us.

As in the case of the older classical colleges, the characteristic work of the "colleges of agriculture and the mechanic arts" has been organized in degree courses. Where the requirements for admission to these are above the attainments of the probable applicants, preparatory departments have been established, whereby the purpose of keeping the colleges in line with the common schools of the country is accomplished. The distinction between the preparatory students and those of collegiate grade is even less marked than in the classical colleges, since all classes participate in the provision for technical and industrial training.

Of the 33 colleges here tabulated 19 report preparatory departments having 2,166 students, the number of students in collegiate departments is 5,910, and the number of graduate students 157, making a sum total of 8,233 students.

The value of grounds, buildings, and apparatus as reported from 24 colleges is \$6,707,799. The amount of productive funds reported from 26 colleges is \$10,169,308; one more college is included in the reported income from productive funds, viz, \$563,204.

From the statement of funds it would seem that these colleges show a higher average of endowment than any other class of institutions save theological schools. Omitting Cornell University, which is one of the five richest foundations in the United States, it appears that 5 of the institutions in Table 51 have productive funds exceeding \$400,000; 3 have from \$300,000 to \$400,000; 4 from \$200,000 to \$300,000; and 8 from \$100,000 to \$200,000. The remaining 5 which report the particular have funds ranging from \$10,000 to \$98,575, the aggregate for the 5 being \$275,575.

The total income is \$1,207,516 reported for 30 colleges. Of this amount 47 per cent. was derived from productive funds, 33 per cent. from State appropriations, 17 per cent. from tuition fees, and 3 per cent. from other sources.

The year has been made memorable in the history of the colleges under consideration by the passage of an act, approved March 2, 1887, "to establish agricultural experiment stations in connection with the colleges established in the several States under the provisions of an act approved July 2, 1862, and of the acts supplementary thereto." Under the provisions of this act an annual appropriation of \$15,000 will be made to each State for the purpose therein specified.

The following are the colleges of agriculture and the mechanic arts that report themselves as sustaining relations to State agricultural stations:

- Agricultural and Mechanical College of Alabama.
- Colorado State Agricultural College.
- Sheffield Scientific School (Yale University).
- University of Florida and State Agricultural College.
- Purdue University (Indiana).
- Kansas State Agricultural College.
- Agricultural and Mechanical College of Kentucky.
- Maine State College of Agriculture and Mechanic Arts.
- Massachusetts Agricultural College.
- Michigan State Agricultural College.
- University of Minnesota.
- University of Nebraska.
- University of Nevada.
- New Hampshire College of Agriculture and Mechanic Arts.
- Rutgers Scientific School (New Jersey).
- University of North Carolina.
- Ohio State University.
- Pennsylvania State College.
- University of Tennessee.
- University of Vermont and State Agricultural and Mechanical College.
- Virginia Agricultural and Mechanical College.
- University of Wisconsin.

TABLE 48.—Summary of statistics of schools of science endowed with the national land grant, for 1886-87.

VIEW OF PRACTICAL WORK AS REPORTED FROM TWENTY-FIVE COLLEGES.

Table 49 presents the result of an inquiry addressed to the land grant colleges for the purpose of ascertaining the proportion of their students who receive practical as well as theoretic training in agriculture, the mechanic arts, etc.

The questions included such practical work in the field or shops as serves to illustrate or to test the theoretic instruction or to familiarize one with a routine of labor, and also investigations carried on in laboratories or elsewhere in pursuit of scientific knowledge applicable to the arts.

From the number and varied character of the colleges addressed it could not be expected that a single form of inquiry would suffice for an exhaustive presentation of this part of their training. But a beginning has been made with results which are not devoid of interest.

Two of the colleges here included report only field and laboratory practice. Delaware College and many land grant agricultural colleges report only laboratory practice.

In the remaining colleges, which reported shop practice also, the courses of training are generally identical, or nearly so, for one or more years, so that whatever may be the final selection, students work in two or more of the lines indicated, and hence the ratios tabulated involve reduplications—in other words, their sum is not 100 per cent. A number of the colleges afford opportunity for remunerative work, of which students, without regard to courses, often avail themselves. It has not been possible so far, even if it were desirable, to discriminate between the work pursued considered as to its purposes, which for convenience may be called illustration, investigation, remuneration.

At the request of the Hon. Justin S. Morrill, the following inquiry was embodied in the form addressed to the colleges under consideration: "What is the full amount given by individuals, towns, counties, or States, either as an outright donation or as an annual appropriation on the part of the Legislatures, to the land grant colleges established under the act of 1862?" The information thus secured, supplemented by statistics previously furnished to the Office, is presented in Table 50.

EQUIPMENT OF AGRICULTURAL AND MECHANICAL COLLEGES.

The Special Report on Industrial Education in the United States, issued by this Office in 1883, contains a full report on the equipment of agricultural and mechanical colleges to that date. In order to ascertain the improvements in the farms, buildings, apparatus, etc, made since that year, an inquiry was addressed to the college presidents asking for further information on the subject. Some of the colleges reported fully. In the case of those not answering the inquiry the catalogues were consulted for the particulars desired. The following is a summary of the information furnished directly by the presidents or gathered from the printed documents:

ALABAMA STATE AGRICULTURAL AND MECHANICAL COLLEGE.

[From letter of Prof. O. D. Smith, secretary of faculty.]

The Agricultural and Mechanical College, Auburn, was organized in 1872. The endowment derived from the sale of the land scrip is \$253,500, yielding an annual income of \$20,280. The college had no other income, except incidental fees, and received no aid from the State until the year 1885. That year the State Legislature appropriated \$30,000 to repair and furnish the college building and equip the agricultural, mechanical, and scientific departments. An annual appropriation was also made of one-third the net proceeds of the tax on commercial fertilizers, for the establishment and support of an experiment station and a mechanic art laboratory. In 1887 an additional appropriation of \$12,500 was made for further equipment of the mechanical and scientific departments.

June 24, 1887, the main college building was burned. The trustees immediately provided for rebuilding it and for the erection of a chemical laboratory. The latter is about complete, and the main building will be completed during the next scholastic year.

In the endeavor to carry out the provisions of the land grant act, the college has become a distinctive school of industrial science or polytechnic institute. It offers three degree courses for undergraduates leading to the degree of bachelor of science (B. Sc.), requiring four years for their completion: (1) Course in chemistry and agriculture; (2) course in mechanics and engineering; (3) general course. There are also two partial courses, each requiring two years for their completion: (1) agriculture; (2) mechanics. Laboratory instruction constitutes an important feature in the work of the college, and is obligatory for all students.

The facilities for this are as follows: In agriculture, a farm of 226 acres, on which is the State experiment station. The students of agriculture accompany the professor in the field, garden, conservatory, stock yard, where lectures are delivered in presence of the object discussed. The mechanic-art laboratory consists of two shops: the first, 90 by 50, contains the wood and the machine shop; the second, 72 by 36, the forge and foundry, all fully equipped.

The power for running the machinery of this department is furnished by a twenty-five horse power Harris-Corliss engine. A steam pump, heater, and indicator form a part of the steam apparatus. The course in shop work extends through three years: first year, carpentry, turning, and pattern making; second year, moulding and casting in iron and brass, forge work in iron and steel; third year, machine work and steam and mill engineering. All students are required to take the first year's work in the shop at least 6 hours per week. Special students take 12 hours per week throughout the entire three years.

The chemical laboratory is a separate two story building, 60 by 43, with a one story annex, 57 by 36. The cost, including furnishings, was about \$20,000. It contains the students' laboratory to accommodate 60 students in analytical work, the State chemical laboratory, two balance rooms, an office, library, apparatus room, and a large lecture room. The engineering department is fully equipped for field and office work.

The departments of physics and natural history will be provided with laboratories in the new college building, and offices and equipment for printing and telegraphy.

All students are required to take technical drawing for two years.

The experiment station has been organized in accordance with act of Congress, with the following corps of directors: (1) president of the college; (2) agriculturist and director; (3) chemist and vice-director; (4) physiologist, animal and vegetable; (5) botanist; (6) entomologist and meteorologist; (7) first and second assistant agriculturalists; (8) first and second assistant chemists. Work will begin at once on the station.

Notwithstanding the fire the college has maintained its patronage, and is growing in public favor.

ARKANSAS INDUSTRIAL UNIVERSITY.

Farm.—The farm consists of 160 acres of land, 120 acres of which are susceptible of cultivation, of which 60 acres are actually under cultivation. A large and commodious barn has been built and the farm has been very well equipped.

Shop.—The shops of the department of mechanic arts and engineering are in the basement of the university building and consist of the following rooms: wood-working room, finishing room, forging room, foundry, metal-working room, engine and boiler room, tool room and a wash room. Each of these rooms contains a full complement of machinery and tools necessary for instruction in the various departments.

Laboratories.—The chemical and mineralogical laboratories have been greatly developed by the addition of appliances, etc.

COLLEGE OF MECHANIC ARTS, ENGINEERING, ETC., UNIVERSITY OF CALIFORNIA.

Shops.—A valuable addition to the equipment of this college was made by the erection of a mechanical laboratory. It is designed to offer facilities for tests and experimental inquiry and comprises a machine shop, carpentry and pattern shop, shop for fine work, steam-fitting apparatus, foundry and blacksmith shops, engine room, and experimental laboratory. These shops are supplied with the latest improved machinery and tools.

Laboratories.—The assaying laboratory is very well equipped and the appliances are of the most approved pattern.

The metallurgical laboratory has been erected and is now being equipped out of the appropriation made for this purpose by the Legislature.

Miscellaneous.—The students' astronomical observatory has been constructed and equipped out of the Legislative appropriation of \$10,000 made for that purpose.

COLORADO STATE AGRICULTURAL COLLEGE.

Shops.—Additions have been made to the machinery in the mechanics' shop.

Laboratories.—The chemical laboratory has been enlarged and provided with more suitable and efficient appliances.

Miscellaneous.—A new conservatory has lately been built and now contains 10,000 plants.

FLORIDA STATE AGRICULTURAL COLLEGE.

The first annual catalogue of this college was published in 1886. The trustees have acquired by donation and purchase more than 100 acres of land suitable for agricultural, horticultural, and ornamental purposes, lying within the corporate limits of Lake City. A commodious building has been erected and farm buildings, equipments, etc., have been added. The college has acquired a large and costly museum of natural history and mineralogy.

GEORGIA STATE COLLEGE OF AGRICULTURE AND THE MECHANIC ARTS (UNIVERSITY OF GEORGIA).

Laboratories.—The only improvement mentioned in the catalogue of this institution is the addition of appliances in the new laboratory.

NORTH GEORGIA AGRICULTURAL COLLEGE.

Laboratories.—A valuable philosophical and chemical apparatus has been added to the appliances, and is used in the department of natural science.

WEST GEORGIA AGRICULTURAL AND MECHANICAL COLLEGE.

This college was established as a branch college of the State University by an act of the General Assembly, approved September 28, 1881. The main building was completed in 1884 at a cost of about \$10,000.

ILLINOIS INDUSTRIAL UNIVERSITY.

Shops.—An addition to the mechanical hall has lately been built, and is used as a blacksmith shop. It contains sixteen forges with anvils and tools, and a cupola for melting iron.

The following additions have been made to the appliances: machinery and tools for the machine and carpenter shops, at a cost of \$4,000; a testing machine of 100,000 pounds capacity; a large dynamo with variety of apparatus for electrical measurements.

Laboratories.—Full equipments for the zoölogical and metallurgical laboratories have been provided, while the botanical laboratory has been enlarged.

PURDUE UNIVERSITY.

Shops.—The new mechanical laboratory is wholly occupied by the school of mechanics and engineering. It contains nearly 11,000 square feet of available floor space. The main portion of the building is occupied by 2 recitation rooms, 2 drawing rooms, and an office. In the wings of the building are a wood-working room, a foundry, a forge room, and a machine room; and connected with these, an engine room, a tool room, and a coat room. The wood-working room contains 20 benches, 11 lathes for turning, a grindstone, a circular saw, and a scroll saw. The foundry is equipped with a cupola furnace for iron, a crucible furnace for brass, a core oven, and a full supply of sand, flasks, and moulders' tools. The forge room contains 12 forges, 12 anvils, and 12 sets of smithing tools. The machine room contains 7 screw-cutting machine lathes, a machine planer, a shaper, a milling machine, a grindstone, 2 vertical drilling machines, a speed lathe, and an emery grinder.

Laboratories.—A new testing and experimental laboratory has been organized, and large additions to the apparatus of the physical laboratory have recently been made.

IOWA AGRICULTURAL COLLEGE.

Shops.—The new hall for the department of civil and mechanical engineering is a substantial brick building, and furnishes all necessary accommodations for these rapidly growing departments, including power, machinery, and tools for working in iron and other metals.

Miscellaneous.—The new office is a substantial two-story brick building for the use of the board of trustees, the president, secretary, and treasurer. The veterinary buildings, costing \$10,000, comprise a building for the offices and class-rooms of professors in this department, and a hospital with all the modern appliances for the treatment of diseased animals.

KANSAS STATE AGRICULTURAL COLLEGE.

Farms.—One of the farms of this college has been enlarged from 170 to 215 acres, so that the two farms now contain 315 acres. A new experimental barn was erected at a cost of \$4,500, and a cattle shed and corn crib at a cost of \$1,100. Numerous, important, and very expensive additions have been made to the stock of farm machinery during the past few years.

Shops.—A number of additions have been made to the machinery and tools for use in the mechanical department.

Laboratories.—An appropriation of \$1,500 for steam-heating apparatus in the chemical laboratory was wholly used as contemplated, in providing steam heat for the building and the various heating apparatus required in connection with the uses of the building, including drying closets and evaporating hoods.

MAINE STATE COLLEGE OF AGRICULTURE AND THE MECHANIC ARTS.

Shops.—The new shop, built during the summer of 1883, is equipped for instruction in three departments of mechanical work, viz, filing, forging, and working in wood.

Laboratories.—Valuable additions have been made to the apparatus and appliances of the chemical laboratory.

Miscellaneous.—The entire herd of cattle, numbering 51 head, was exterminated in the fall of 1885 on account of the appearance in it of a contagious disease.

MASSACHUSETTS AGRICULTURAL COLLEGE.

Farm.—The farm has been greatly improved by clearing and draining during the last few years. A corn crib, with a capacity of 2,800 bushels, has been built at the north-west corner of the barn, while the entire lower floor of the barn has been repaired and rearranged. An ice house for use in connection with the dairy, of a capacity of 100 tons, has been annexed to the farm-house.

Laboratories.—The entire apparatus and appliances of the laboratory have been replaced, and several thousand dollars have been expended in the purchase of models and apparatus in the departments of physics and natural history.

Miscellaneous.—The new south dormitory and agricultural hall, replacing that destroyed by fire, February 4, 1885, and the chapel-library building, are in every way convenient and adapted to supply wants long felt.

MICHIGAN STATE AGRICULTURAL COLLEGE.

Shops.—The State Legislature of 1885 appropriated \$17,000 for the establishment of a department of mechanic arts, with shops for working in wood and iron. The new building, erected for this purpose, furnishes a large lecture room, a mechanical laboratory, a draughting room, and a blue print room. In this building there is a complete blacksmith shop and brass foundry. There is also an iron-working shop, furnished with an engine and all appliances necessary to a complete shop. The Legislature of 1887 appropriated \$3,000 additional for the extension of these shops.

Laboratories.—The Legislature of 1885 gave \$7,486 for the purpose of building and equipping a veterinary laboratory, and the Legislature of 1887 gave \$5,000 for building a horticultural laboratory.

Miscellaneous.—A new armory and drill hall has lately been erected, the Legislature of 1885 having appropriated \$5,000 for that purpose.

MINNESOTA COLLEGE OF AGRICULTURE AND THE MECHANIC ARTS (UNIVERSITY OF MINNESOTA).

Farm.—A new experimental farm of 250 acres of valuable land is located between Minneapolis and St. Paul. The regents erected a complete set of buildings and equipped them with a full complement of stock, implements, and machinery.

Shops.—The college of mechanic arts building has been erected quite recently. It has two stories, with a high basement, and a one-story wing to the rear.

The basement of the new building is occupied by the testing laboratory, machine and vise shop, and wood-working shop; the wing, by the engine and boiler room, forge shop, and foundry.

These shops are equipped completely with tools from leading manufacturers, which represent the best American practice. Each shop will accommodate 10 students at a time.

AGRICULTURAL AND MECHANICAL COLLEGE OF MISSISSIPPI.

Farm.—The farm now contains 1,750 acres of land, of which 600 acres are under cultivation. A full outfit of stock, implements, and machinery has been provided by the trustees.

MISSOURI AGRICULTURAL AND MECHANICAL COLLEGE (UNIVERSITY OF MISSOURI).

Farm.—The State of Missouri failed for a long time to make any provision towards equipping the farm of the college. At a recent session of the Legislature the following appropriations were made: For sheds, tool-houses, and hog barn, \$1,000; for cattle and sheep barn, \$5,000; for dairy, ice house, and repairs, \$2,000; for two cottage houses, \$1,200; for the purchase of sheep of the various breeds, \$500; for the purchase of swine of different breeds, \$250; for the purchase of breeds of cattle, \$3,500; for the purchase of horses, tools, etc., \$2,000; for experimental work, \$2,000; for students' labor, \$1,000; for horticultural building, \$1,300.

Shops.—In the new improvements of the university a magnificent workshop with power has been provided.

Laboratories.—The State has appropriated \$5,000 for a veterinarian's laboratory and apparatus.

MISSOURI SCHOOL OF MINES AND METALLURGY (UNIVERSITY OF MISSOURI).

Laboratories.—The new chemical laboratory has been in use one year. It contains the following apartments: The quantitative laboratory; the qualitative laboratory; directors' laboratory; lecture room; assay laboratory and weighing room; a quantitative and qualitative evaporating room; preparation room; a supply room; and two basement rooms.

INDUSTRIAL COLLEGE OF THE UNIVERSITY OF NEBRASKA.

Farm.—The farm has been greatly improved during the last few years and the cattle yards rebuilt. An additional corn crib of 500 bushels capacity has been built.

Laboratories.—The new chemical laboratory was completed in 1886. It measures 132 feet in length by 65 in width, and is three stories high. On the ground floor is a large general laboratory, in which 80 students can be provided with conveniences for work at the same time. Adjacent to this laboratory are rooms for storage of apparatus and chemicals, and for assaying, combustions, and distilling. On the second floor is the qualitative laboratory, accommodating 32 students, a small lecture and class room, a special analytical laboratory, a room for analysis of gases, and the necessary store rooms. On the third floor are the large lecture room, a quantitative laboratory, a library and balance rooms, a professor's study and laboratory, store and apparatus rooms.

COLLEGE OF AGRICULTURE AND THE MECHANIC ARTS (UNIVERSITY OF NORTH CAROLINA).

Laboratories.—Among the recent improvements is a new laboratory, well arranged for all the needs of general, industrial, and agricultural chemistry. It includes rooms for qualitative and quantitative analysis by students, and private laboratory room for the professors.

OHIO STATE UNIVERSITY.

Laboratories.—An appropriation of \$2,500 has been recently expended in procuring additional apparatus for the mechanical laboratory; and the same amount in equipping the laboratory of agricultural chemistry.

PENNSYLVANIA STATE COLLEGE.

Shops.—The new building, which is now occupied by shops, was completed in February, 1886. It is divided into four main compartments, viz, carpenter shop, wood-turning room, forge room, and machine-shop. Besides these, the attic of the engine-house is used for a lumber-room. Each of the shops has been fitted with a full complement of tools and machinery.

TEXAS AGRICULTURAL AND MECHANICAL COLLEGE.

Farm.—During the years 1883-84, there were erected on the farm, a new barn, costing about \$1,800, and cattle sheds costing about \$1,200. Provision has been made for erecting creamery buildings and a residence for the farm superintendent.

Shops.—A brick machine-shop was erected during the year 1883-84 at a cost of \$4,500. Provision has also been made for an extension of the shops for additional forges.

Laboratories.—The chemical and physical laboratories have recently received important accessions of apparatus.

Miscellaneous.—A new building, "Pfeuffer Hall," for the accommodation of additional students, was reported to be ready for occupancy by September 5, 1887.

UNIVERSITY OF WISCONSIN.

In 1884 Science Hall, one of the largest and most necessary buildings, was destroyed by fire. With it were destroyed much scientific apparatus and collections of great value. The Legislature of 1885 provided in large part for the reconstruction of the building and for the addition of such other buildings as were necessary to place the university upon a lasting foundation. As a result of this action, a chemical laboratory, a new and commodious machine-shop, boiler-house and appurtenances, and a new science hall have been erected. In 1887 the Legislature provided funds and directed the regents to establish an agricultural experiment station. The chemical laboratory of the station has been gradually provided with a good working outfit of apparatus.

TABLE 51.—Statistics of schools of science endowed with the national land grant, for 1886-87; from replies to inquiries by the United States Bureau of Education.—PART I.

Location.	Name.	Presiding officer.	Date of organization.	Instructors.		Students.						Number of State scholarships.	Number of other free scholar- ships.	Number of years in full course of study.	Number of weeks in scholastic year.
				Number in preparatory department.	Number in collegiate department.	Number in preparatory department.	Number in degree courses.	Number in other courses.	Collegiate depart- ment.

List of agricultural and mechanical colleges whose work cannot be separated from that of the State universities of which they are departments. (See Table 44.)

Location.	Name.
Berkeley, Cal.....	College of Agriculture, Mechanics, Mining, Engineering, and Chemistry (University of California).
Athens, Ga.....	Georgia State College of Agriculture and Mechanic Arts (University of Georgia).
Baton Rouge, La.....	Louisiana State University and Agricultural and Mechanical College.
Minneapolis, Minn.....	College of Agriculture and Mechanic Arts (University of Minnesota).
Columbia, Mo.....	Missouri Agricultural and Mechanical College (University of Missouri).
Lincoln, Nebr.....	Industrial College of the University of Nebraska.
Reno, Nev.....	University of Nevada.
Chapel Hill, N. C.....	Agricultural and Mechanical College (University of North Carolina).
Columbus, Ohio.....	Ohio State University.
Providence, R. I.....	Agricultural and Scientific Department of Brown University.
Columbia, S. C.....	South Carolina College of Agriculture and the Mechanic Arts (University of South Carolina).
Knoxville, Tenn.....	University of Tennessee and Agricultural and Mechanical College.
Burlington, Vt.....	University of Vermont and State Agricultural College.
Morgantown, W. Va.....	Agricultural Department of West Virginia University.
Madison, Wis.....	College of Arts (University of Wisconsin).

SCHOOLS OF SCIENCE NOT ENDOWED WITH THE NATIONAL LAND GRANT.

NOTES FROM CATALOGUES.

CONNECTICUT.

Storrs Agricultural School, at Mansfield, is purely an agricultural school. The full course of study requires 2 years, of 3 terms each. The school possesses a farm of 170 acres well suited to the purposes of instruction. The last State Legislature appropriated \$9,000 for the erection of a new laboratory and a barn. The former, which is nearly completed, is a one-story building, with attic for storage. It is 35 feet wide and 64 feet long, and very complete in its arrangement. The entire cost will be \$7,000. The appropriation for the barn is \$3,000. It will be a plain, substantial structure, 40 by 80 feet.

DAKOTA.

The *Agricultural College*, at Brookings, provides 2 courses of study, viz, a course in agriculture for young men, and a course in domestic economy for young women. These courses include the usual literary and scientific studies that lead to the bachelor of science degree. In addition, one industrial study or occupation is required each term. The college has just come into possession of a half-section of improved land, which, with the 80 acres given by the people of Brookings, constitutes a tract of 400 acres for college campus and practical farming. The college buildings are three in number, viz, college hall, which contains finely equipped laboratories for experimental purposes; the ladies' dormitory, and the gentlemen's dormitory. Finely equipped shops for wood and metal work have been provided.

The *Dakota School of Mines*, at Rapid City, was opened February 17, 1887, for a special course in assaying, etc. Four professorships were established, and a number of students presented themselves and were in attendance until the close of the term. The school has established three full courses of study, viz, mining engineering, civil engineering, and a general scientific course. The school of mines building proper is a commodious brick structure, 3 stories in height. The laboratory building is 2 stories in height, and is 138 by 60 feet. It is not attached to the college building proper, but stands 200 feet distant from it.

INDIANA.

Rose Polytechnic Institute, at Terre Haute, offers 3 courses of study, viz, mechanical engineering, civil engineering, and chemistry. A course in electrical engineering will soon be added. This, like the other courses of this richly endowed institution, will be placed upon an excellent footing as regards professors and material equip-

ment. The shops for practical work comprise a wood shop, a machine shop, a forge room, a brass foundry, an engine and boiler room, and an engineering laboratory. The academic building is a brick structure, 4 stories high.

MASSACHUSETTS.

The *Lawrence Scientific School* of Harvard University, at Cambridge, offers 4 courses of instruction, viz, a course in civil and topographical engineering, a course in chemistry, a course in natural history, and a course in mathematics and physics. The celebration of the 250th anniversary of the founding of Harvard College led to the first reunion of the graduates of this school which has ever been held, and at this meeting the future of the school was most earnestly considered. Three plans were suggested. In his report for the current year, the dean, W. S. Chaplin, expresses his preference for that of concentrating the work of the school on the one subject of engineering.

Bussey Institution of Harvard University, at Jamaica Plain, gives systematic instruction in agriculture, useful and ornamental gardening, and stock-raising. The farm belonging to the institution and upon which the school buildings are situated comprises 200 acres.

The *Worcester Polytechnic Institution*, at Worcester, offers courses of instruction in the following departments, viz, civil engineering, mechanical engineering, chemistry, physics, and drawing. The capacity of the shop has recently been nearly doubled by a gift of \$13,600. The shop contains an engine and boiler room, blacksmith shop, tool room, draughting room, painting and finishing room, work rooms equipped with tools and machinery, and other auxiliary rooms.

MICHIGAN.

The *State Mining School*, at Houghton, was first opened for instruction on September 15, 1886, with 3 professors and 24 students. The course of study embraces geology, mineralogy, chemistry, mining and mining engineering, and such other branches of practical and theoretical knowledge as will conduce to the end of enabling the students of this institution to obtain a full knowledge of the science, art, and practice of mining, and the application of machinery thereto. Tuition is free to all bona fide residents of the State.

MISSISSIPPI.

The *Industrial Institute and College for Women*, at Columbus, was opened October 22, 1885. The design of the institution is threefold: (1) To confer a thorough general education. (2) To give the best normal training, together with teaching and practice in kindergarten. (3) To train pupils in the various industrial arts. The buildings occupied by this institution were donated by the city of Columbus to the State, and have been repaired and improved so as to conform to the uses for which they are intended.

MISSOURI.

The *Polytechnic School* of Washington University, at Saint Louis, offers 4 courses of study extending through 5 years. They are, a course in civil engineering, in dynamic engineering, in chemistry, and in mining and metallurgy. During the year under consideration, a metallurgical mill has been erected in connection with the department of mining and metallurgy for the sampling of ores and mineral substances, the testing of ores, etc., on a commercial scale. The mill is equipped with a complete set of machinery. The university is supplied with finely equipped laboratories for the study of physics and chemistry.

NEW HAMPSHIRE.

The *Chandler Scientific Department* of Dartmouth College, at Hanover, provides a 4 years' course, at the completion of which the B. S. degree is conferred. This course is intended to qualify young persons for the duties and employments of active life.

The *Thayer School of Civil Engineering*, at Hanover, is a department of Dartmouth College, and aims to provide an exclusively professional training for young men who may desire instruction of an advanced character. The course is essentially "post-graduate," and extends through 2 years.

NEW JERSEY.

The *Stevens Institute of Technology*, at Hoboken, is purely a mechanical engineering school. It offers a 4 years' course, at the completion of which the degree of M. E. is conferred. The institute is provided with a machine and carpenter shop, an iron and brass foundry, and a blacksmith shop, each of which is fitted with a full complement of tools and machinery.

The *Newark Technical School*, at Newark, was opened on February 9, 1885. The course of study comprises instruction in mathematics, drawing, chemistry, and physics, extending over 4 years. This school is designed to give mental training to men who are already well advanced in some line of manual art. The State appropriates annually from \$3,000 to \$5,000 towards the support of the school.

The *John C. Green School of Science*, at Princeton, is a department of the College of New Jersey. It provides a course in general science and a course in civil engineering, at the completion of which the degrees B. S. and C. E. are conferred. Laboratories with experimental apparatus have been provided in order to familiarize the student with the practical part of the profession which he is studying.

NEW YORK.

The *Cooper Union Free Night Schools of Science and Art*, in New York, provide courses of study in science, art, stenography, type-writing, telegraphy, drawing, modelling in clay, designing, etc. The building occupied by these schools has been practically reconstructed at a cost of about \$275,000.

The *School of Mines of Columbia College*, in New York, offers seven parallel courses of study, viz, mining engineering, civil engineering, metallurgy, geology and palæontology, analytical and applied chemistry, architecture, and sanitary engineering. Each of these courses occupies 4 years. The plan of instruction includes lectures and recitations; practice in the different laboratories; field and underground surveying; practice and study in mines, mills, machine-shops, and foundries; reports on mines, industrial establishments, and field geology.

The *Rensselaer Polytechnic Institute*, at Troy, now offers two courses of study—a course in civil engineering and a course in natural science—each of which covers a period of 4 years. During the first 2 years the courses are identical, but during the last 2 years the course in natural history embraces less of higher mathematics and more of natural history, chemistry, and geology. The main building is four stories in height, and contains full suites of recitation, lecture, and drawing rooms, the cabinet of natural history, and the library. The Winslow Laboratory contains the metallurgical laboratory, the chemical laboratory, and lecture, recitation, and apparatus rooms.

OHIO.

The *Industrial and Art School of the Ohio Mechanics' Institute*, in Cincinnati, provides instruction under 3 departments, viz, mechanical department, architectural department, and artistic department. This is an evening school, where instruction is given free of charge.

The *Case School of Applied Science*, at Cleveland, offers five regular courses of study. Each course requires 4 years for completion, and for proficiency in any of them the degree B. S. is conferred. The following are the courses, viz, general course, civil engineering, mathematics and astronomy, physics, and chemistry. The Case School building, to which the school was transferred in September, 1885, was burned on October 27, 1886. The trustees and faculty of Adelbert College generously offered rooms and appliances for carrying on the work of the school, and recitations were resumed on the following Monday, work having been suspended but 3 days. The rebuilding of the burnt structure was begun at once, and a temporary laboratory was erected for immediate use. Instruments and apparatus were procured for the classrooms and laboratories, and the work of the classes proceeded with comparatively little interruption.

PENNSYLVANIA.

The *Pardee Scientific Department* of Lafayette College, at Easton, is designed for those students who wish to study mainly the sciences, history, and the modern languages, and for those wishing to prepare for professional work in civil engineering, mining engineering, and chemistry.

The *Franklin Institute*, at Philadelphia, is designed for the promotion of the mechanic arts. The instruction consists of a course of lectures on subjects of a scientific and technical character, 30 or 40 of these lectures being delivered each year. Members' tickets admit to these lectures, and members have the privilege of receiving admission tickets for friends. A school of instruction in drawing, embracing the mechanical, architectural, and free-hand branches, has been maintained since the foundation of the Institute. The tuition fee in the drawing school is \$5 per term of 16 weeks.

The *Spring Garden Institute*, at Philadelphia, maintains schools in two distinct departments—art and mechanical. Each department has night and day classes, the former being intended for apprentices, boys learning trades, and boys and girls still attending the public schools. The art department includes all the drawing and painting classes and the classes in modelling. The mechanical department includes the mechanical schools in wood and metal, the drawing classes attached thereto, and the classes in metallurgy and chemistry.

The *Towne Scientific School* of the University of Pennsylvania, at Philadelphia, offers 5 technical courses of instruction covering a period of 5 years. The courses are chemistry and mineralogy, metallurgy and mining, civil engineering, dynamical engineering, and mechanical drawing and architecture.

Instruction in the *Wagner Free Institute of Science*, at Philadelphia, is given by a course of free lectures on scientific and technical subjects.

Lehigh University at South Bethlehem comprises two schools—the school of general literature and the school of technology. The former offers 3 distinct courses, viz, the classical course, the Latin-scientific course, and a course in science and letters. The school of technology includes 5 distinct courses, viz, civil engineering, mechanical engineering, mining and metallurgy, electrical engineering, and chemistry. Ample opportunity for practical work is afforded by the laboratories and work-shops of the University.

SOUTH CAROLINA.

The branches of study taught at the *South Carolina Military Academy* at Charleston are grouped under the following departments, viz, mathematics and English, physics, science, history, belles-lettres and ethics, modern languages, and military science and tactics. No degrees are conferred by this institution.

VERMONT.

Norwich University, at Northfield, is a military, scientific, and classical school. Five regular courses of study have been established, as follows: Civil engineering, architecture, chemistry, science, and literature, and a course in arts. At the completion of any of these courses, the appropriate bachelor's degree is conferred.

VIRGINIA.

The *Virginia Military Institute*, at Lexington, offers besides a regular academic course, special courses in general and applied chemistry and civil engineering, one of which may be elected by students of the first and second classes. These courses are so arranged as not to disturb the class standing in the academic course, equivalent studies being supplied to maintain the established value of the academic degree. Cadets who successfully accomplish either of the special courses receive in addition to the academic degree, the degree of bachelor of science or of civil engineer.

The *Polytechnic Institute*, at New Market, offers preparatory, academic, and collegiate courses of study. At the completion of the last named, the degree of A. B. or C. E. is conferred.

REMARKS UPON TABLES 52 AND 53.

Table 52 presents the summarized statistics of 32 schools of science not endowed with the land grant. Of these, 8 are department schools or colleges embraced in larger

organizations; the remainder are independent foundations. Their work is generally organized on well-defined lines, and can easily be expressed in tabular form.

The total income reported for the year, 12 schools not included, is \$631,279. Of this sum, 24 per cent. was derived from productive funds, 21 per cent. from tuition fees, 39 per cent. from State appropriations, and 16 per cent. from other sources.

On account of the varied character of the institutions here classed together, the statistical information is supplemented by brief descriptions of the individual schools.

TABLE 52.—Summary of statistics of schools of science not endorsed by the national land grant, for 1896-97.

State or Territory.	Number of schools.	Instructors.		Students.		Number of endowed professorships.	Number of State scholarships.	Number of other scholarships.	Number of bound volumes in libraries.	Value of grounds, buildings, and apparatus.	Amount of productive funds.	Income from productive funds.	Receipts for the last year from tuition fees.		Receipts for the last year from State appropriation.	Receipts for the last year from other sources.	Total income.	Benefactions.	Total number of degrees conferred in course at last commencement.

COMPARATIVE STATISTICS OF ATTENDANCE UPON COLLEGES AND SCIENTIFIC SCHOOLS
FOR 1875-76 AND 1885-86.

Table 54 presents a comparative view of attendance at colleges and at both colleges and scientific schools for the years 1875-76 and 1885-86, and the ratio which such attendance bore to the population at those dates.

The populations have been estimated from the data furnished by the United States census of 1870 and 1880, and the statistics showing attendance, as specified, from the reports of this Office. Students in preparatory courses or departments have not been included.

Considering the institutions involved in the discussion, it will be seen that there was a decrease of 9 in the number of colleges reporting attendance in 1885-86 as compared with the number in 1875-76, and an increase of 10 in the number of scientific schools. The attendance upon the smaller number of colleges in 1885-86 exceeded the attendance in 1875-76 by 7,072, or 27 per cent.; the attendance upon both colleges and scientific schools increased by 8,950, or 28 per cent.; whilst the increase in the estimated population was 11,355,972, or 25 per cent.

The comparative view of the relation of students to population for the years selected is presented by States and by geographical sections in Columns 12, 13, 14, and 15 of the table before us. The statistics, as tabulated, show increase in the number of students as compared with the population for colleges alone and for both colleges and scientific schools in the North Atlantic and North Central Divisions of the country, and decrease in the three remaining sections.

Many considerations are suggested by this view; the most important pertains to the statistics themselves. Do they fairly represent the situation? If they do not, the failure is attributable to the want of accuracy in the returns made to the Office, or to the failure of institutions to make any returns.

With respect to the first-named source of possible error, it can only be said that an examination of the returns for the years intermediate between 1875 and 1886 confirms the statistics reported for those years.

With respect to the second source of error, it is evident that a number of colleges reporting at the earlier date failed to do so at the later date. Some of these have suspended operations; others, finding it impossible to maintain the college standard, have assumed the work of secondary schools; a few have not furnished recent information. While the number of these last is not large, their omission is to be regretted in an inquiry of this kind.

As regards the country at large the conclusions here established must be approximately correct. If any State or section is misrepresented it is hoped that the additional data required to do justice to the same will be immediately forthcoming. Indeed, one great purpose of the inquiry, carried so far as the material at hand permits, will have been served if this illustration of its importance in settling questions of public moment shall induce greater care and promptness in replying on the part of those by whom the facts must be supplied.

In considering the relative status of the geographical sections of the country, as shown in Columns 12, 13, 14, 15, it should be remembered that the two Southern sections have a large colored population which is scarcely represented in college attendance. Comparison between the ratios here given and those published in De Bow's Review as early as 1857 will naturally occur to many minds.

The latter estimates were for 29 States, considering the white population only. The conclusions established by De Bow's figures are placed in comparison with the foregoing in the following summary, the same States being included in both sets of ratios:

Section.	Number of States.	White population to 1 college student, 1857.	Total population to 1 college student, 1885-86.	Total population to 1 student-college and scientific school, 1885-86.
North Atlantic Division	9	901	1,281	945
South Atlantic Division	7	521	2,489	1,859
South Central Division	6	534	2,350	2,149
North Central Division	7	817	1,543	1,394

De Bow's table is given in full, p. 734.

CHAPTER X.

PROFESSIONAL INSTRUCTION.

The chief particulars of the current record of the professional schools of the United States, as reported from the several States and Territories, are presented in the summaries of the tables.

Considering the country by geographical sections, the totals appear as follows:

TABLE 56.—*Summary of statistics of schools of theology and law, by geographical sections, for 1886-87.*

Division.	Schools of theology.					Schools of law.

In the Report of the Bureau for 1885-86 attention was called to the fact that the faculty of Harvard had laid before the Academic Council a plan for the abridgment of the college course by those students who go from college directly into one of the professional schools of the university. The subject was made a special order for the December meeting of the Academic Council; and, in consequence of the discussion which then took place, a committee of nine persons was appointed to consider the whole question of the relation of the degree of A. B. to the other degrees conferred by the university. That committee made their report to the Academic Council at the close of the year 1886-87; and the Academic Council have now recommended to the college faculty that, in the interest both of the professional schools and of the graduate department, some reduction be made in the requirements for the degree of A. B.

I.—SCHOOLS OF THEOLOGY.

The following is a comparative statement of the number of schools of theology (including theological departments) reporting to this Bureau each year from 1877 to 1887 inclusive (1883 omitted), with the number of professors and number of students:

	1877.	1878.	1879.	1880.	1881.	1882.	1884.	1885.	1886.	1887.

ST. VINCENT'S SEMINARY, GERMANTOWN, PA.

The following account of St. Vincent's Seminary, Germantown, Pa., is furnished by the president, Rev. James McGill. It illustrates the character of a number of seminaries in the United States which combine collegiate and professional instruction in such a manner as to make it difficult to give them exact representation in the tables.

The seminary, as such, holds no real estate nor funds. It is supported by an association of Catholic clergymen for the purpose of giving a select number of young men an opportunity to pursue a course of study in literature, higher mathematics, modern languages, philosophy, and theology. For admission an examination is required which would entitle the applicant in any well-conducted college to the A. B. degree. The course of study embraces a period of eight years; each scholastic year consists of forty weeks.

The entire number of students for the scholastic year 1886-87 was 25; and the classification—9 in theology, 6 in philosophy, and 10 in the two years' preparatory course, which consists of an exhaustive review of previous studies in English, Latin, Greek, French, German, and mathematics. The study of higher mathematics may be continued during the two years' course of philosophy, and, if the needs of the student demand it, during the first and second years of the theology course. All the students are required to follow both the classical and scientific courses. The language of the class during the last 6 years of the course is Latin.

The library contains from 11,000 to 12,000 volumes. The institution has never received any State or municipal appropriation of any kind. Tuition is free for all who pass the examination for admission. The professors number 6.

PROGRESS DURING THE DECADE.

As in the case of similar tables, the comparative statistics of schools of theology from 1877 to 1887, inclusive, simply show the relative numbers reporting to the Office in the successive years.

The details as recorded during the period indicated show further the degree of permanency in institutions, and the positive increase in their numbers.

From a comparison of the detailed statistics of 1877 with those of the current year, it appears that of 124 schools tabulated at the earlier date, 91, or 73 per cent., are still found in the table.

Ten of the remaining 33 have ceased to exist, and 23 have made no recent report.

Thirty-two schools which were in existence prior to 1877, but did not report at that date, are now reporting. Of the remaining 22 schools found in the table for 1886-87, 4 had just begun operations in 1877 and 18 have been opened since.

Of the 91 schools which reported in 1877 and in 1886-87, 12 failed at one of the dates to report the particulars required for comparative study; the remaining 79 show increase during the decade of 31 per cent. in the number of instructors; 30 per cent. in the number of students; 53 per cent. in the number of volumes in libraries; 65 per cent. in property valuation; and 42 per cent. in productive funds.

The 91 schools whose permanence and vigor are attested by the statistical record have been the recipients of liberal and repeated benefactions. So far as reported to this Office, the total of money gifts and legacies to schools of theology during the ten years under review was \$6,697,210. Of this amount 91 per cent. went to the schools in question.

The present relative importance of the same schools may be judged from the fact that they include 73 per cent. of the instructors and 73 per cent. of the students reported from schools of theology. Forty-two of the number report their productive funds, the total amount being 93 per cent. of the total productive funds in the table.

The 22 schools whose operations are limited to the ten years under review include 10 per cent. of the instructors and 10 per cent. of the students in the table.

From this analysis it is evident that the schools which have reported irregularly represent but a small part of the entire provision for theological instruction, and do not greatly affect the general bearing of the statistical record.

THEOLOGICAL SCHOOLS ORGANIZED SINCE 1876.

Table 59 shows the relative position of the various religious denominations in respect to the number of schools which they maintain, and the number of students attracted to them.

The 22 schools organized during the decade are distributed among twelve denominations. The Baptist, Lutheran, and Methodist Episcopal Churches have contributed 4 schools each.

The first named include 23 per cent. of the instructors and 23 per cent. of the students reported from the new schools; the second, 14 per cent. and 19 per cent., respectively; the third, 14 per cent. and 16 per cent., respectively. The financial

resources of the new schools are not fully given, only 15 of the 22 reporting even their property valuation. Of the entire amount, viz, \$434,000, 31 per cent. is owned by the four Baptist schools, 20 per cent. by three of the four Lutheran schools, 22 per cent. by three of the Methodist Episcopal schools, and 23 per cent. by one school under the auspices of the Protestant Episcopal Church. Productive funds are reported from seven only of the new schools. In these, as in all theological schools whose invested funds are small, special contributions from churches and individuals form a large part of the income, tuition fees being low, and in many cases remitted entirely.

Six of the 22 schools established since 1876 are for the education of colored students. One of the most important of these is the Gammon School of Theology at Atlanta, Ga., which was organized in 1883 as a department of Clark University. Beginning with an attendance of 2 students, it closed its first year with 19, and has steadily increased in numbers year by year, reaching in the current year a total of 57.

Among the favoring conditions attending the origin of the school, not the least was the gift of twenty thousand dollars by Rev. E. H. Gammon, of Batavia, Ill. The growth of the institution, and the rapid extension of its field of influence, with the corresponding demand for enlarged facilities, have prompted him recently to propose a munificent addition to the endowment, which will establish the school on a firm and permanent basis. The only condition imposed by Mr. Gammon, in unfolding his plan, was that the school should be made an institution of a purely theological character, entirely independent of any other institution in its organization and government. In accordance with his views, the official connection of the school with Clark University was dissolved in April, 1887, and it was placed on an independent basis.

CHAPTER XII.

MANUAL AND INDUSTRIAL TRAINING.

I. MANUAL TRAINING AND INDUSTRIAL DEPARTMENTS IN THE PUBLIC SCHOOLS.—Purpose—Location, equipment, and course of training—Coördination with the other studies of the system—Cost—Results—Opinions of superintendents as to the advisability of introducing manual training into the public schools—Industrial training in schools for the deaf; in schools for the blind; in reform schools; in schools for the feeble-minded; in Indian schools; in colored schools—Societies for the promotion of manual training. **II. MANUAL TRAINING AND TRADE SCHOOLS.**—St. Louis manual training school—Chicago manual training school—Baltimore manual training school—Other manual training schools—New York trade schools—Statistics of manual training schools (Table 67)—Summary of statistics of industrial schools (Table 68)—Statistics of industrial schools (Table 69).

I. MANUAL TRAINING AND INDUSTRIAL DEPARTMENTS.

IN THE PUBLIC SCHOOLS.

The introduction of manual training as a public school study may be said to be yet in the experimental stage, rendering an exposition of its condition less complete and more difficult than an account of the more thoroughly organized branches of the system of public schools. The recent addition of the study, however, invites inquiry as to the objects to be attained by its introduction, the methods of accomplishing them, the cost entailed, and the results; while the agitation against the so-called overloaded curriculum of the upper grades of the public schools calls for an examination of the manner of interpolating a study new in a twofold sense into that curriculum. The reports of the city superintendents and other school officials have therefore been examined with reference to these heads of inquiry; for no better testimony, it is thought, could be obtained than that of the agents of the people at whose expense the new study has been introduced and is supported.

Purpose.—In Portland, Me., the superintendent of the city schools was encouraged by a petition signed "by all to whom it was presented," to ask the city council for a grant of \$1,500 to establish a manual training school, because "the belief is gaining ground in our own country, as well as in other countries, that youth should be educated in the use of the tools of industry as well as in books; and in other cities it has been found by trial that this can be done during school life without impeding other studies." Considerations of a fiscal nature sent the matter over for a year. The school committee of Springfield, Mass., say: "It has been and will continue to be the aim of the committee to bring the course of study in the schools into harmony with the best and most practical educational methods known, in order that the analytical, reasoning, and constructive powers of the scholars may be developed, that they may become familiar with practical things and leave school * * * equipped with knowledge * * * that will be useful to them in whatever honest occupation they may follow. As nearly 95 per cent. of the scholars who go out from the schools will from necessity become engaged in some kind of manual labor, it is important that manual training should have an established place in our school system." In New Haven, Conn., it is considered "as a protest against the teaching of mere words, and makes its eloquent appeal for recognition on the ground that it supplies an element in education that has been almost entirely lacking."

In his report for 1885-86, the superintendent of the Newburg, N. Y., schools, after remarking "that drawing gives the qualifications of a good mechanic except the practice," continues: "These views have long been held by the board of education of the city of Newburg, and in order more fully to carry out the ideas involved therein, this board has established a manual training school for the more perfect and symmetrical development of the hand and eye. A most weighty and practical reason for this is that by far the greater number of pupils must after leaving school get their living and employment by the use of their hands and eyes. * * * Primarily, the aim of the manual training school is to train the hands of the pupils, to give them the power of doing."

In their matter-of-fact and otherwise very valuable report on manual training in the common schools, the committee on course of study and school books of the board of education, New York City, after noting that the leading purpose of manual instruction in Europe "is to foster industrial skill," and "only incidental reference is had in most cases to its general educational, disciplinary, and intellectual relations," that "it has long been a matter of deep regret, and even of apprehension, that a large proportion of our young people are growing up with a positive distaste for manual labor;" that the introduction of manual training "into many of the schools and higher educational institutions of the country, has already begun to exert an influence towards bringing about a better state of things;" and that a wide gap exists "between the kindergarten and the high school," arrived at this, the first of several conclusions: "That the introduction of what is generally known as manual training would be an improvement to our present course of study." "Instruction in drawing," they continue, "and the introduction of object-teaching have proved of the greatest advantage, and lead directly and naturally to those subjects and methods now under discussion;" and "it has come to be generally recognized as true that a certain amount of *work*, some application of mental power through the bodily powers, some production of physical results of thought and intention, implying the training of the senses, especially through the hand and the eye, are needed to produce a well-trained mind."

At Minneapolis, Minn., "An important reason for introducing industrial training into the public schools is found in the wide-spread distaste for manual labor. Serious apprehensions may well be aroused in view of the large number of youth growing up to manhood, not only without a handicraft, but even disdaining such an occupation," and "One of the practical benefits which may be expected from the introduction of manual training into the schools is the furnishing of superior foremen and superintendents for our various industries. The apprentice system is a thing of the past." * * * In no way can men be more successfully fitted for these responsible positions, than by combining with a thorough intellectual discipline, early familiarity with the principles of mechanics and the use of tools." In the course of his comments on the recent introduction of manual training in the schools of St. Paul, Minn., the superintendent remarks: "The coördination of mental and manual training to its practical limit in our public schools, will foster an industrial spirit and bring to the surface, not intellectual strength but a genius adapted to this kind of education. That there is in our schools a large amount of undeveloped skill will surely be seen as soon as an opportunity is given, and which has heretofore been clearly demonstrated in the work which has already been done under the general subject of drawing." The object at Omaha, Nebr., among the first to introduce manual training, is not to teach "but to prepare the students for greater proficiency in a trade should they conclude to become mechanics."

Location, equipment, and course of training.—In four cities the school is located in the high-school building of the system, in three other cities it is situated in buildings of other grades. In Boston the present quarters are too small for proper instruction in carpentry, and on the vacation of the building now occupied by the Horace Mann School for the Deaf, the committee on manual training will ask for it. The course of instruction is invariably in wood-working—carpentry—given, as at Springfield, Mass., in 15 lessons of 45 problems, or, as at Mont Clair, N. J., in 40 graded lessons. In several instances the instruction is under the care of graduates of manual training schools, in others under a skilled mechanic who has had some experience in teaching. The equipment is almost invariably for about 10 or 20 students, and consists of carpenters' benches and the necessary tools. It is understood that the course of instruction is of 1 year, with the exception of Mont Clair where it is of 3.

Coördination with the other studies of the system.—Five of the seven school systems giving information on the subject have schools to which the students come especially to receive this instruction, not of course including the pupils attending schools occupying rooms in the same building in which the manual training school is located. One exception is the Minneapolis course, the manual training apparently being confined to the high school pupils, which perhaps would throw it into the category of manual training schools (see page 791). The classes, either 10 or 12 or 20, usually receive one lesson a week, generally occupying the half of a school day; at Omaha and Minneapolis instruction is given for over an hour daily, and at Mont Clair for the second and third grades for an hour semiweekly. The pupils are drawn from the high school or the upper grades of the grammar schools or both, except at Mont Clair, where the pupils of the high school and highest grammar grade are excluded.

Cost.—This is a very difficult question to discuss. The word "equipment" may include many things at one place not included by it at another, vitiating results as to per capita cost. Nor is this the only obstacle. In a public school the pupil or his fictitious representative "in average attendance" occupies the same desk every day of the school year; in these schools for manual training, only an hour or two every week, and then gives place to another. In Boston, for instance, the total cost for the first year for 200 pupils was \$2,500, a per capita cost of \$12.50 each, but as they were divided

into classes of 20, receiving a lesson a week, covering a half a day, the weekly attendance of 200 under such circumstances is merely equivalent to the attendance of 20 pupils for 5 full days; thus the per capita cost viewed in this light would be \$125. The cost for the last school year was \$7.50. It may be said that the cost of manual training as a part of the public school system should be dealt with as if it were a question as to the cost of grammar or geography. But, even ignoring the fact that the cost of the apartment in which manual instruction is given—and to which instruction it is wholly devoted—is not included as a part of the cost, it would be manifestly wrong to compare the per capita cost of a course in manual training in which a lesson of an hour is given daily to the same class, with the per capita cost of instructing the same class for half a school day once a week. At Springfield, Mass., the equipment cost \$503, or \$42 per capita (8 classes of twelve each, instructed once weekly), and the running expenses \$3.03, based on total number instructed. At Omaha the equipment cost \$2,129, and the expenses of running about \$18 a pupil, based on average attendance. At Mont Clair the expenses for equipment were \$350, those for 1886-87 \$1,000. The New York committee, in their report already referred to, compute that an outfit for a workshop will cost \$300, and running expenses, exclusive of teachers' salaries, \$80, to which must be added the cost of constructing or preparing a workroom, computed at \$100.

Results.—After giving some statistics of attendance in Boston, the superintendents will again be allowed to speak for themselves.

Of the 200 boys that began the course in the Boston school for the last school year, 49 dropped out, 33, or 17 per cent. of the whole number, from obtaining employment, 2 from dullness in their regular studies, and 4 were expelled for insubordination. In Springfield, Mass., the school committee ask for an appropriation of \$5,000 to extend the scope of the school "in view of the encouraging results of the experiment," and "it is the testimony of the principals of the high school and grammar schools that the time given to manual training has not retarded the pupils in their regular studies." In Mont Clair, N. J., the "boys show great diversity of talent, some becoming in a little time quite expert in tool handling, while others find it much more difficult." In New Haven, Conn., "some boys were heedless and seemed to lack the power of close attention and nice execution. The inability of some to use their hands at first and the decided gain in manual power exhibited after a few weeks of practice, furnish strong arguments in favor of such training."

In Newburg, N. Y., it is too soon to speak of results, but "the boys take to the work with enthusiasm, and many of them show unmistakable signs of becoming expert in the use of tools." The introduction of steam power is advised, and the intention to increase the equipment noted.

In Minneapolis, Minn., the principal of the high school remarks: "So far as can be judged from the work of the past term, the school is a success, and will continue to be more and more useful as experience shows better methods of management. This course seems to attract and hold boys who would at this stage of their work drop out of school if such course was not provided."

In Omaha, Nebr., the committee on manual training says: "We can not emphasize too strongly the value of this system, which we believe in time will come into general use." "On the whole," says the superintendent, "our experiment with a manual training department in our high school, as far as it has gone, must be considered a success. It has not interfered with the regular academic work, * * * and the progress of the boys in the mechanic arts has been satisfactory."

Industrial training for girls.—The courses of industrial training for girls are as yet sewing and cooking. With the thorough introduction of "construction" work, as contemplated at New York and Washington, D. C., for instance, the girls will receive instruction in the general principles governing the combination of elements into a harmonious whole, as well as in the specific duties of two branches of industry both eminently adapted to their sphere in domestic life, and also immediately useful. Sewing would appear to be excellently fitted for introduction into the school course, since from its nature the students are not required to leave the class-room while under instruction; and although the superintendents of the evening schools of Brooklyn, N. Y., advocate the congregation of those who desire instruction into a class, their recommendation is based on the complaint of individual scholars of the evening schools that they were being retarded in other studies by the time consumed in sewing, and not upon any fundamental difficulty of teaching the art in the ordinary school-room.

At Boston, where the study has been most thoroughly introduced and organized, even to the extent of holding weekly meetings of the sewing teachers for conference, the course of instruction is, in brief, as follows: After the child has been taught how to select both thread and needle, to thread the needle and to hold it, it is put to basting together a "bag-apron," in which to keep the work; then it is taught to back-stitch, to hem, and to overcast the seams of the basted apron. This method has the advantage, says the supervisor of sewing, of interesting the child, since it is employed in making something that it is to wear. The material is almost invariably furnished by

the pupil; the garment is prepared by the teacher and sewed under her direction. Great interest is manifested at the homes of the children, and cases are known in which the child has instructed the mother in the lesson that it has learned at school. In a few schools dressmaking has been introduced; simple dresses, however, are made in all the schools. In concluding her remarks the supervisor says:

"There is no doubt that the habits formed in connection with learning to sew have an important influence on the life and character of the girls and of their homes. It may be confidently asserted that the influence of the sewing is healthful and lasting upon the mind and character of the pupils, and on that account, no less than for its material utility, it deserves the respect and encouragement of the community. As a department of school work it is second to none in the success which it has attained and the interest it has enlisted in and out of the school-room."

At Philadelphia, the success of the instruction in sewing caused its introduction into the secondary and grammar schools for girls; and the experience of two years has been most satisfactory. "It is believed," says the superintendent, "that the instruction in this branch is more extensively and thoroughly organized in this city than in any other in the country. Twenty-five thousand girls are now regularly taught the principles and practice of sewing by a corps of thirty-two special teachers." At Mont Clair, N. J., three grammar grades receive instruction in a graded course of sewing, cutting, and fitting, given to the girls in their class rooms, while the boys are engaged in the shops.

The inexpensiveness of the materials (in Boston costing about \$200 a year), the cleanliness, and particularly the simplicity of the work, permitting the pupil to remain at her desk, render sewing much less difficult to introduce and maintain as a study than cooking, which not only requires appliances that are inappropriate to a school-room, but an activity that is incompatible with the order that is exacted there. At Boston, where instruction in cooking is more extensively introduced than in any other city, there are four cooking schools, or kitchens, as they are there called. Each school has ten classes composed of 15 or 20 pupils, as the case may be, each class receiving about twenty lessons. Taking the oldest school, instituted and as yet sustained by the liberality of Mrs. Hemenway, as illustrating the manner of conducting these "kitchens" and of connecting them with the usual studies of public schools, the course may be said to be as follows: From each of five public schools in the vicinity of the "kitchen," 30 pupils are selected and divided into two equal classes. For the two classes thus formed from the contingent of each school, a day of the week is set apart (it is presumed that in the forenoon one class is instructed and in the afternoon the other) for instruction. Thus the two classes of the Hyde School have Monday, of the Winthrop School, Tuesday, and so on for twenty weeks. Still using the statistics of Kitchen No. 1 as typical of the class, it appears that the cost of giving 150 girls a course of twenty lessons was $28\frac{1}{2}$ cents a girl, or $1\frac{1}{2}$ cents for each lesson given to each pupil. Of the 700 families who have been represented at this school during the years 1885-87, 692 have expressed themselves in favor of it. "No school," says the chairman of the Committee on Manual Training of Boston, "established among us ever received such quick appreciation from all classes of our people."

Opinions as to the advisability of introducing manual training into the public schools.—An analysis of the answers made by 16 State superintendents to an item on one of the Bureau's forms of inquiry shows that 11 favor the introduction of manual training into the public school system, 4 of whom and 2 others who are otherwise non-committal think it impracticable to introduce it into the country schools; 1 considers it a good thing in the abstract, and 2 are opposed to it. The superintendent of Brooklyn, N. Y., thinks the question merely one of expense, remarking: "It is clearly impossible to introduce manual training to any extent in our present class-rooms, and I do not think the board of education would be justified in expending any portion of its appropriations for the erection of work-shops so long as thousands of children are refused admission or permitted to attend but half a day." The superintendent of Worcester, Mass., though far from questioning the utility or necessity of technical schools, is a determined opponent to the introduction of manual training into the public schools, and the superintendent of Meriden, Conn., says in his report for 1886-87: "The testimony we have gathered from places where the experiment has been tried are far from satisfactory;" while the superintendent of Joliet, Ill., recommends a middle course, objecting to the manual training as "no part of the public school system, and for several reasons is out of place as an annex to it," but would "encourage the pupil to spend part of his time while out of school in industrial and mechanical work." To this end, annual "industrial fairs" are held with highly satisfactory results.

Drawing.—The unmistakable tendency to make drawing the hand-maiden of constructive work is plainly evinced in several quarters. "The work in this department [that of drawing] was recast somewhat," says the superintendent of the Troy (N. Y.) city schools, "by the adoption of a course which looked wholly toward the industrial features of the study, but preserving and continuing all the advantages derived from the system in use." "It," [drawing] says the president of the St. Louis

school board, "contributes in several ways to educate; it teaches the eye to see better, the hand to yield up some of its almost incorrigible obstinacy; and the faculty of memory is strengthened by its pursuit. As we are engaged in training some thousands of boys who in the fulness of time will become artisans and mechanics, engaged in the numerous branches of industry common to a great centre like St. Louis, we owe it to ourselves and to them that our well-earned credit for intelligence shall not suffer by any appearance of indifference here. Drawing ought to be kept very near to the three R's, because it is one of the arts of expression, that one which is capable of depicting the worker's thought with graphic clearness, such as no formula of words can always adequately do."

Under the caption "Drawing in the grammar schools as a means of manual training," the superintendent of the Washington (D. C.) schools remarks: "The work, as a whole, is included under three heads, construction, representation, and ornamentation. In each of the above lines of work the effort is first to lead the pupil to see and decide, and afterwards to make or to do."

The new course of study in drawing adopted in 1885 by the Brooklyn (N. Y.) board of education is reported as eminently preferable to the old. The third feature of this new course is its "industrial application." Although the concurrent testimony given above shows a marked tendency to make instruction in drawing an introduction to manual training, the Office has been unable to ascertain its magnitude. The subject of drawing is again, though incidentally, referred to in the following.

Industrial exhibits.—Under the heading, "Opinions of superintendents as to the advisability of introducing manual training into the public schools," mention has been made of the advocacy and adoption by the superintendent of Joliet, Ill., of industrial exhibits; he is not alone in his practice. At several other towns similar exhibits of manual work, "realized drawing," as the superintendent of Moline calls it, are annually made.

The Office is not in possession of sufficient evidence to assert that these exhibits are the natural outcome of the exhibitions in the past of the progress of the pupil in drawing, and that the effort to "realize," to materialize what has been taught as drawing, is a development as natural as the effort now making in several quarters to fill the gap that exists between the kindergarten and the manual training school, but the following quotation from the report of the Albany (N. Y.) superintendent would seem, together with hints from other sources, to justify such a conclusion: "The Drawing Exhibition * * * was made one of the most attractive features of the occasion. The scholars' work exhibited was even more varied and extensive than at the last exhibition. Much interest was shown by the thousands that viewed the drawings; especially in the unusually large number of strictly industrial pieces, which showed to all the highly practical nature of this study, now admitted to be as essential a part of primary education as reading or writing." If the interest was augmented by the representation of industrial pieces, why not still further enhanced by showing the thing itself.

The opportunity of giving the public a tangible evidence of what they are accomplishing is far too favorable to be neglected by superintendents. "Exhibitions," says the superintendent of Lewiston, Me., "possess many valuable features, inasmuch as the public is reached and moved by them. An interest in behalf of the public schools is aroused which otherwise would lie dormant. * * * To encourage manual labor I recommend industrial exhibitions, where not only school work may be seen, but work performed out of school, including sewing, cooking, carpentry, etc."

"While there may be a difference of opinion regarding the value of these exhibits," says the superintendent of Moline, Ill., "there should, it seems to us, be only one opinion concerning the value of the training which must inevitably accompany the 'doing' or 'making' which have rendered these exhibits possible, especially if properly planned, and accomplished with due regard to the other work of the school."

At Oskaloosa, Iowa, where the exhibition lasted 3 days, the handiwork of the pupils filled 5 rooms. The exhibit comprised articles made with tools from wood, drawings, needle-work, and specimens of cooking. At Joliet, Ill., where the exhibitions, inaugurated in 1884-85, are called industrial fairs, and "the effect upon many of the pupils was magical," no exhibition was held for 1886-87 owing to the prevalence of sickness. At Salem, Mass., the pupils of the Bowditch School gave their second industrial exhibition, making a display highly creditable, though not so varied as the first. At Moline, Ill., 10 classes constitute the scheme of exhibition, which is so systematic and well digested as to call for insertion in full:

CLASS I. Drawing:

- A. Representative or object drawing (free-hand). All grades.
- B. Construction or working drawings. Grade 6 to high school.
- C. Decoration designs in black and white. Grade 4 to high school.
- D. Free-hand outline copy. First 3 grades.

CLASS II. Stencil work:

(Color effects obtained by using paper of different colors.) Grade 5 to high school.

CLASS III. Scroll-saw work:

(Patterns for wood, iron, brass, etc., cut out of Manilla board.) Grade 3 to high school.

CLASS IV. Cut-work designs:

(Paper of different colors.) Grades 1 to 5. (Grades 1 and 2, paper folding and weaving.)

CLASS V. Outline embroidery:

(Butchers' linen, crash, muslin, and other materials.) Grade 2 to high school. (Grade 2, embroidery cards.)

CLASS VI. Applique work:

(Felt, etc., in different colors.) Grade 4 to high school.

CLASS VII. Construction:

A. Wood joints, etc. (from plans). Grade 6 to high school.

B. Forms made of paper and other sheet materials (from patterns). Grade 6 to high school.

CLASS VIII. Wood carving:

Grade 6 to high school.

CLASS IX. Exercises in plain hand-sewing:

A. Running (unbleached muslin 8 by 4 inches). Grade 2.

B. Over and over (unbleached muslin 8 by 4 inches). Grade 3.

C. Hemming and gathering (Lonsdale cambric 12 by 2½ inches). Grades 4 and 5.

D. Patching (woolen 4 by 4 inches). Grade 6.

E. Darning (woolen 4 by 4 inches). Grade 7.

F. Button-holes (cotton and woolen, with lining, 4 by 4 inches). Grade 8.

G. Hem-stitching (lawn 6 by 6 inches). High school.

CLASS X. Drawings, models, collections, etc.:

Illustrating subjects taught in school (map work is included in this class). Grade 6 to high school.

For the preparation of this work the following regulations were issued:

"1. This exhibit is designed to be, in the fullest sense, a school exhibit; *i. e.*, an exhibit of such work as it is possible and desirable to do in school under the direction and guidance of the teacher.

"It comprises (a) specimens of drawing, showing the kind and variety of class work given as a means of training pupils to appreciate and represent form, and (b) specimens of created or materialized form which have for their basis a knowledge of drawing.

"2. The specimens handed in need not, as heretofore, be obtained as test work. They may be obtained under such conditions as accompany the proper teaching of any subject.

"3. It is not expected (drawing excepted) that every pupil in the grades designated will attempt to prepare a specimen of each kind of work. Some pupils may take up one thing, some another.

"4. Each girl is expected to prepare a specimen of plain hand-sewing.

"5. All material will be furnished. Send to the principal or superintendent for such material as is needed.

"6. Work should be completed ten days before close of term.

"7. Try to get as many products for class X as possible. Here is a wide field for effort.

"8. The time assigned to drawing and 1½ hours Friday afternoons may be taken for this work. This is the *maximum time* to be taken during the regular session.

"9. All specimens should be numbered according to plan of last year."

IN OTHER EDUCATIONAL INSTITUTIONS.

Manual training in the form of apprenticeship at trades (see p. 82, "Convention," abstract of the remarks of Superintendent Clarke) has long been coordinate with the ordinary school work in the education of the deaf; the absence of the feature in day schools for them making such schools an exception. "Institutions having the whole care of children between the years of 10 and 20 owe them an industrial training," says Dr. G. O. Fay.¹ The old system of working in the morning and in the afternoon of each day is being supplanted by one of two systems denominated rotating. By one, the pupil spends one-half of his school day in school and the other in working; by the other, only one-third of the day is spent at work. Dr. Fay, in the article quoted from above, states that the latter plan is preferable; for while giving a reasonable proficiency at a trade, it allows the pupil the time for school work that the pupils of the higher classes and the brighter scholars have felt the need of. Seven pupils from

¹Proceedings of 11th Convention of American Instructors of the Deaf, p. 224.

the Chicago schools for the deaf, ranging from 14 to 21, have entered the industrial school of the city board of education, and "so far are holding their own with those who hear and speak;" while in Boston the pupils of the Horace Mann School were permitted to attend institutions of that city for manual instruction. In 41 institutions giving manual instruction, 29 provide shoemaking; 25, printing; 15, cabinet-making; 12, carpentry; 12, dress-making, and 8, tailoring. Although the number following these and less generally introduced trades is not given, the predominance of shoemaking, printing, and wood-working may be taken as indicating their adaptability as trades for the deaf.

The object of introducing manual training into the public schools is mainly to supply a correlative to the mental training they are intended to give. In the deaf-mute institution the object has been to make the trade learned in the institution a means of support in after life. In his report to the committee of the board of directors of the Pennsylvania Institution, Principal Crouter remarks that the difficulty experienced by the deaf in acquiring trades does not arise so much from want of mechanical ingenuity on their part as from the indisposition of employers of skilled labor to afford them a fair opportunity to learn them. Accurate statistics as to deaf-mutes are very difficult to obtain; so much so, that the government of Holland declined to attempt to collect such information in the census of 1879. But the desire to judge of their work by evidences of a more practical character than the results of the final examination, to investigate the intricate question of heredity in deaf-mutism, and to ascertain if their graduates have been helpless in the community, has induced most extensive inquiries on the part of the Pennsylvania Institution and the American Asylum at Hartford. The inquiries instituted by the first institution among its graduates as to the callings they followed showed that of 119 pupils taught shoemaking or tailoring (the trades principally taught), 34.5 per cent. followed that taught them in the institution and supported themselves thereby; the percentage of shoemakers being 53, that of the tailors 19. The result of the inquiry of the American Asylum, at Hartford, shows that 19 per cent. of 368 of its graduates are farmers, 16 per cent. are engaged in some business by which wood is fashioned by hand tools, and 13 per cent. are shoemakers; the occupations, mainly mechanical, of the other half are too diverse for classification. The trades taught at the institution are cabinet-making, shoemaking, and tailoring, but the statistics do not show the relation between the manual instruction given at the school and the vocation followed as a means of livelihood. Principal Williams observes, however, that comparatively few of the former pupils follow the trade taught them.

In schools for the blind.—Music and the trade of broom-making stand out so prominently, are so generally recognized as vocations for the blind, that the other occupations taught are comparatively insignificant. "My personal experience as a blind man," says F. J. Campbell, now principal of the Royal Normal College and Academy of Music for the Blind, London, "and my experience as a teacher of the blind in Tennessee, Wisconsin, New England, and Great Britain, prove conclusively to my mind that if music, based upon a thoroughly good intellectual training, is properly taught, it is worth more, in a practical point of view, than all other avocations combined which are open to the blind." In the fortieth annual report of the Indiana institution, Superintendent Jacobs remarks: "There is probably no attainment a blind man can possess, that he can turn to better account in an effort to find congenial and lucrative employment than the ability to repair, regulate, and tune pianos and cabinet organs. Good tuners are always in demand." The experience of the Pennsylvania institution and of others confirms Superintendent Chapin in the belief that "its [tuning] relative importance as a bread-winner is very high." As to the ability of the blind to acquire this very desirable art, Director Anagnos uses no doubtful language: "I have repeatedly stated in my previous reports that the blind develop * * * a remarkable power of distinguishing the pitch and qualities of sounds; that as a result of this ability they acquire great proficiency in the art of tuning piano-fortes; that in this calling they labor under no disadvantage whatsoever, * * * and that their work is, in many respects, more thoroughly and satisfactorily done than that of most of their seeing competitors. I desire to repeat the assertion * * * it does not rest upon a mere *a priori* reasoning, but is warranted by experience gathered in the field of observation and confirmed by an array of indisputable facts." "Of nineteen who have acquired the trade and have been furnished with tools," says Superintendent Clement, of the New York State Institution, "fourteen are successful."

While competent testimony shows piano-tuning to be a profession that may be followed by the blind with success in the North, West, or South, or in Europe, the trades taught stand upon a different basis, the locality having much to do with the return the workman receives for his labor. Where the corn is cheap, as in Texas, broom-making is remunerative; in Illinois broom-making and cane-seating are the most lucrative occupations, and carpet-weaving has been dropped as unprofitable, while in Pennsylvania broom-making and carpet weaving are the most profitable, and cane-seating is unreliable.

In reform schools.—The claims of industrial education, taught in a thorough and systematic manner, for recognition in this class of schools are briefly stated by the trustees of the Illinois State Reform School, who say: "Boys from 13 up to 20 years old, who are deprived (no matter from what cause) of their liberty, should have an opportunity of acquiring some trade. The large majority of men who get into State prison have passed the age." The organic act of the Ohio Industrial School requires the board of trustees to have the pupils taught in some agricultural or mechanical industry, which has been done "so far as circumstances and appropriations would permit"; but in many cases it would appear that the industrial instruction given is more adapted to keep the boys from idleness or to produce revenue while in the school than to furnish them with a means of livelihood after they have left it. But the tide is setting against "reform schools for revenue," to use the vigorous phrase of the superintendent of the Indiana School for Boys, and he looks forward to the time when the pupils of his institution can be taught "the science and art of working in wood or iron," while the superintendent of the Newark (N. J.) City Home follows in the same line, declaring that "the purpose of profit should yield to the design of reformation." The board of control of the Michigan School heartily endorses and concurs in the recommendation that some form of light manufacturing be introduced into their institution "as a reformatory agency," and only as such. In New York and Pennsylvania the contract system has been abolished and the managers of the New York House of Refuge ask for an appropriation to enable them to reclaim a tract of marsh in order to train the pupils in agriculture and horticulture, "as best for the interests and future welfare of the boys;" while the managers of the Philadelphia House of Refuge desire to move from their present city quarters and establish an agricultural reform school where farming and trades may be taught, as "it is of essential importance that children should have the benefits of a manual training as a reformatory factor for their present and future advantage." In New Jersey the boys have been taken (though at a loss) from the ironing of shirts and put to work at farming, carpentry, blacksmithing, and shoemaking; and in New Hampshire a hosiery mill has been established in connection with the school. Although our reformatory schools are as yet only on the borderland of systematic manual training, as that term is used above, it is not because its value as a means of reformation and of future self-support are ignored. The superintendents of the New Jersey, Indiana, Michigan, and Cincinnati institutions are asking for the "manual training school system." The superintendent of the Illinois School, where the contract for making shoes is about to expire, is inclined to it, but fears that "the money required to carry on such industries, with but little prospect of profitable return on a currency basis, is the only apparent obstacle to technological labor in a reform school;" while the superintendent of the Nebraska School has already introduced the system to a limited extent (at the expense of two of the officers), and asks not only that an appropriation be made to carry it on, but that the name State Reform School be changed to State Industrial School. The results already attained in the "Mechanical School" (a school of carpentry) of the Maine State Reform School "fully justify the wisdom of the Legislature in establishing this labor-teaching department."

In schools for the feeble-minded.—Nine years ago instruction in trades was introduced as a part of the school work of the Kentucky institution for this class of children. "It was an experiment," says Superintendent Stewart, "as nothing of the kind had ever been tried before, and it was adopted by the board of commissioners after much thought and many fears." A small carpenter and shoe shop was built for the boys, and a sewing-room and laundry for the girls, in which instruction was given in the afternoon. It was soon developed that work in the shop was an incentive to mental and physical effort, and applications by the children for permission to learn a trade had to be refused from want of accommodations. The additions to and repair of the institutional buildings are done by the boys learning carpentry, while the 20 boys at work in the shoe shop make shoes for the inmates and supply a demand at Frankfort. In a report made in 1881, after an experience of several years, Superintendent Stewart remarks: "It has been demonstrated in our institution that some children who could not be taught to read or write could be taught some useful kind of labor." In this report the superintendent states that the pupils in the shops are graded by their intelligence, the first or most intelligent class are taught carpentry; the second class, shoemaking; the third class, mattress, broom, or mop making, and the lowest class have been found surprisingly apt in tying brooms, making mops and stuffing and sewing mattresses. The girls do the sewing and a large part of the laundry work of the institution. The number of inmates at the institution is kept down by the non-admission of idiots and the unimprovable, and the fact that "the system of instruction in the common trades enables us [the Kentucky institution] to send away every year almost as many as we receive, they being reasonably equipped in those branches and able to maintain themselves or contribute largely to their own support."

In Indian schools.—"All Indian schools should be agricultural training schools on the reservation," says Agent Cramsie in a report to the Commissioner of Indian Af-

fairs. "The one great and important industry which should be taught to all Indian boys is agriculture," says Agent Kinney. "We have endeavored to give agricultural knowledge to every pupil by our system of outing [placing the student with a farmer]; and to that end the apprentices in the different shops have been largely allowed to go out on farms," says Superintendent Pratt of the Carlisle School, in his annual report. Without admitting that the only road out of savagery lies through herding or agriculture, Superintendent Pratt urges against the objection that trades are taught that can not be utilized, that "there is scarcely a mechanical pursuit that does not directly minister to agricultural success." The enactment of the law providing for citizenship and the allotment of land would seem to call for agricultural training for the rising generation of Indians, the future landholders; manual training being especially valuable as inculcating habits of industry.

It is inferred from a remark of the superintendent of Indian schools that mechanic trades are not taught at many of the reservation schools, "as no provision has been made," and it appears that while 40 "industrial teachers" are employed at an average annual salary of \$575 in the 57 reservation boarding-schools, none are employed in the 90 day schools. In the boarding-schools under bonded superintendents, 6 "industrial teachers" are on the rolls as such at an average salary of \$708; but, for reasons given under the "Education of the Indian," Chapter XIV, this is believed to fall far short of the true number.

Working in wood and leather, and blacksmithing are the principal mechanic industries taught at these schools. At Carlisle the distribution for the year last passed was as follows: Carpentry, including wagon-making, 34; shoe and harness-making, 69; tailoring, 39; printing, 15. Full statistics are not given for the other schools, but it appears that shoemaking and carpentry are most commonly taught. The erection of a 3-story building, 60 by 40, has given the Haskell Institute at Lawrence, Kans., facilities to teach the above-mentioned and other trades.

In colored schools.—The annual distribution of \$45,000 by the trustees of the John F. Slater fund is enabling the institutions aided, 39 in 1886-87,¹ to provide the organization and appliances that systematic industrial education demands, but the institutions for the colored people that give industrial training differ so in character and methods as to render a statement in tabular form of the statistics of their industrial departments impracticable at this date. Of 26 secondary institutions for colored persons, containing nearly 7,000 pupils, 9 institutions had industrial courses attended by 1,525 pupils; that is, of the whole body of secondary pupils in 26 schools about 25 per cent. were receiving industrial training. Although the diversity of the character of the institutions precludes tabulation of the number in industrial courses the uniformity with which the same trades have been adopted at the several schools permits a statement of the kind of industrial instruction given. To the female pupils house-work, cooking, and sewing are taught; to the male pupils carpentry, farming, and printing very generally, with occasional instances of work in iron, as at Atlanta (Ga.) University, State Normal School, Tuskegee, Ala., and Tougaloo, Miss. At Knoxville, Tenn., the directress of the Slater Training School hopes "to engraft industrial training upon the regular city school system." Three grades from the city schools, 168 pupils in all, attend, and on Saturdays there are classes from other grades of the city schools. Two of the 5 teachers are paid by the city school board. The instruction in carpentry in the schools for males is very practical—constructing and repairing buildings, making plain furniture, and wagon-making. At Clark University, Atlanta, Ga., this last industry has assumed considerable proportions. At Tougaloo University, where the instruction is graded and very thorough, the conclusions arrived at are thus expressed by the president of the school: (1) Industrial training is of prime importance for the colored people; (2) it aids the work in the school-room through the discipline and the habits it gives; (3) the industries pursued should be those of the most utility to the people, and a few of these are better than many; (4) to insure success both competent teachers and ample appliances are necessary; and, finally, the chief difficulty is to make the necessary adjustments between head-work and hand-work. It is hoped by the authorities of Fisk University, Nashville, Tenn., that a sufficient sum will be added to a recent gift of \$4,000 to enable them to start a "school of mechanics and engineering."

SOCIETIES FOR THE PROMOTION OF MANUAL TRAINING.

The oldest of these societies, and perhaps the most comprehensive, is the Industrial Education Association of New York, a reorganization of the Kitchen Garden Association of the same city, with a greatly enlarged sphere of activity. The new objects of the association since its reorganization in 1884, are: (1) To secure the introduction of manual training as an important factor in general education, and to promote the training of both sexes in such industries as shall enable those trained to become self-supporting; (2) to devise methods and systems of industrial training, and to put them into operation in schools and institutions of all grades; (3) to provide

¹ Forty-one in all, of which two are medical schools.

and train teachers for this work. To accommodate the Museum of Industrial and Technical Education and the large classes that must be gathered together "to demonstrate the practicability of ingrafting the system advanced by the association on the present system of general education," the building previously occupied by the Union Theological Seminary was leased for 8 years, at an annual rental of \$6,000, and taken possession of in October, 1886. The number of pupils taught by the association in its various departments of instruction in the main and other schools was 4,383 for 1886-87; of the 992 pupils under instruction in the main building, 65 were teachers. Twenty-five teachers in the pay of the association taught classes in different parts and suburbs of the city, and through its instrumentality "industrial drawing, clay-modelling, wood-carving, carpentry, and sewing have been introduced into the public schools of Hoboken and Staten Island with a fair degree of success." The crowning effort of the association, however—the realization of the third feature of its work—is the establishment of an industrial normal school or college for the training of teachers, under the presidency of Dr. Nicholas Murray Butler, who is assisted by four instructors. The conditions of admission, such, with one exception, as a grammar-school graduate should be able to meet, are remarkable from the requirement of as much geometry as is contained in the first five books of Davies's edition of Legendre. The course for female pupils differs from that for men by the addition of domestic science to the studies common to both; that is, the studies of history and science of education, mechanical drawing and wood-working, and modelling and industrial art. A model school of several grades is attached to the college. The Cleveland Manual Training School Company was incorporated June 2, 1885, for the "promotion of education, and especially the establishment and maintenance of a school of manual training." The school that was quickly established is more fully referred to in the following section (p. 792): The Industrial Education Association of New Jersey was organized at a meeting held June 5, 1885, at Hoboken, N. J., with the object of stimulating public favor; to train women and girls in domestic economy; to teach such industries as shall enable those trained to become self-supporting; to study and devise methods and systems of industrial training, and secure their introduction into the public schools, and to provide and, if necessary, to train teachers for the work. Permission was given to the association to place a teacher in the public schools of Hoboken, and 8 classes were instructed in sewing for the girls, and clay-modelling for the boys. The Milwaukee Manual Training Association was organized during the fall of 1885, as "the growth, prosperity, and general welfare of Milwaukee demand that immediate steps be taken to provide industrial education and manual training suited to the genius and character of her people, and to her possibilities and destiny as a leading and influential industrial city." It was thought that the most economical and effectual way to accomplish the desired object "is in connection with the public high school, and that new buildings * * * should be erected at an early day."

It will be observed that one of the objects of these societies is to demonstrate the feasibility and the advantage of introducing industrial training into the public schools; and the matter has therefore been included under this head.

II. MANUAL TRAINING AND TRADE SCHOOLS.

In the foregoing the condition of manual and of industrial instruction as a feature of a school or system of schools has been briefly reviewed. It remains to examine the object and methods of manual training and industrial schools. Provisionally these institutions have been arranged in the following tables under two heads, one containing the schools whose pupils possess the requirements of the upper grades of the public schools, the other those schools which are at the same time elementary schools and workshops. The classification is merely tentative; continued examination will correct the inadvertencies of the tables, and additional information may change their form and, in the case of the second table, their place.

A decade has passed since Professor Runkle became acquainted with the system of instruction pursued at the Imperial Technical School of Moscow, saw its utility, and advocated and secured its introduction into the Massachusetts Institute of Technology. Of the several manual training schools or departments established since that important event, it will here suffice to mention three that claim particular attention by reason of the sources from which they sprang; private munificence at St. Louis, commercial enterprise at Chicago, and the comprehensive interpretation of its educational obligations by the city of Baltimore.

The St. Louis Manual Training School, though a department of the Washington University, owes its establishment in 1879 to the liberality and wisdom of several gentlemen of St. Louis, by whom the buildings were erected and the school endowed. To define the scope of this school and give its program of manual studies is to give those of the other two of which it seems to have been the prototype. "Its object," says the second article of the ordinance given by the Washington University, "shall be instruction in mathematics, drawing, and the English branches of a high school course,

and instruction and practice in the use of tools. The tool instruction, as at present contemplated, shall include carpentry, wood-turning, pattern-making, iron chipping and filing, forge work, brazing and soldering, the use of machine tools, and such other instruction of a similar character as may be deemed advisable to add to the foregoing from time to time." In all the schools the course is of three years. At St. Louis and Chicago the first year is spent at wood-working, the second at the forge, and the third at the metal-working bench and lathe, and in the study of machinery. The sequence at the Baltimore school is somewhat different, forging coming in the first, and pattern-making and vise-work in the second year. Mathematics through trigonometry, English language, literature, and history, and elementary science are relied on for mental training, and free-hand and mechanical drawing is the intermediary that brings the mental and manual work into relation. At St. Louis and Chicago, Latin and French are optional for English; in all the schools the day is about equally divided between the two concurrent systems of development.

The history of the Chicago Manual Training School began at a meeting of the Commercial Club of that city in 1882, during which funds were subscribed and a committee appointed. On April 19, 1883, the Chicago Manual Training Association was incorporated and the control of the school vested in a board of 9 trustees appointed by it. The school was opened in February, 1884, on completion of its building, with 72 pupils, and closed June, 1887, with 190.

But perhaps the most interesting example of the establishment of an institution of this class is the organization of the Baltimore Manual Training School as a part of the public school system of that city. On the 24th of April, 1883, in response to a motion, a committee was appointed by the school commissioners to report upon the best means of fitting boys and girls "as quickly as possible for self-support." On June 19, 1883, the committee reported that it would be expedient to establish a high school for manual education under the supervision of the board, since "a knowledge of some form of industrial labor is as necessary as a knowledge of books; and as the State and city acknowledge their obligations to teach children to read and write they can not deny their obligation to teach them to work, as the latter is as essential for the public welfare as the former. Only a small portion of those who receive their education in the public schools ever enter the professions, but the large number become artisans and adopt mechanical occupations for their future support." On petition, the city council empowered the school commissioners to establish the school, and legislative action was taken in January, 1884. In March of the same year the school was opened with 60 students; in June, 1887, it closed with 150.

The equipment of these typical schools is adequate, perhaps fully adequate to the demand of their students, if such an expression can safely be applied to any school system or school. The cost of the apparatus of the Baltimore school to the close of 1886 was \$10,680, and this school, the youngest of the three, appears to be somewhat less largely equipped than its precursors; the motive power for operating its machinery is less, and the accommodations of the wood-working and forging departments, especially the latter, seem to be intended for fewer pupils, though this may merely indicate more attention to the other subjects of technical study requiring neither steam power nor anvils.

Time enough has not elapsed to speak of "results." Of the 40 graduates of the St. Louis school in 1885, 5 became teachers of manual training, 11 engaged in some business requiring technical knowledge, and 11 entered higher institutions, 3 into technical schools. Of the 27 graduates of the Chicago school, 7 entered higher technical schools, and all but four, whose occupations, if pursuing any, are not reported, have entered manufacturing houses or higher institutions. Of the 34 young men who withdrew from the Baltimore school during 1886-87, 7 are learning the trade of machinist, 4 that of carpentry, and 3 are severally engaged in car, carriage, and watch making.

At the St. Louis school, tuition is \$60, \$80, and \$100 for the three years respectively, and until the close of the last school year it was the same at the Chicago school, an addition of \$20 having recently been made to the charge for each year. At the Baltimore school tuition is free to residents, to others it is \$50. At St. Louis there are 50 to 60 full or partial scholarships; at the Chicago institution provision is made for a limited number who can meet every requirement but the fee.

In 1885, the Philadelphia Manual Training School was opened as a part of the public school system, and on the petition of the Cleveland, Ohio, board of education the State legislature empowered that body to levy a special tax to establish a manual training school for the benefit of the pupils of the Cleveland public schools. As the directors are elected partly by the board of education and partly by the Cleveland Manual Training School Company, a stock company with a capital of \$25,000, the Office assumes that the fine institution established by the company has either wholly or in part been adopted by the city, the only change being the abrogation of the charge for tuition. Both of these schools are on the "Russian or St. Louis plan," but it is noticeable that the central school feature obtains at Cleveland, the pupils attending three times for 3 hours each during the week. This might cause the Cleveland

school to fall more properly under the foregoing general head, but as its pupils must have the requirements necessary to gain admission to the city high schools and be 14 years of age, it has been deemed expedient to treat it as a manual training school as the Office understands that term, a school having a graded course in wood, iron, and machinist's work, systematic and continued instruction in free-hand and mechanical drawing, and a post grammar school course of study, as coördinate departments.

The schools mentioned above give a practical conception of the processes by which the raw materials with which they have to do are operated upon and fashioned to meet the wants of a manufacturing age. But there is another class of schools whose purpose is to teach trades—to make skilful bricklayers, stonecutters, or plumbers, or to improve those who are already mechanics. In this class, or rather school, since, as far as the Office knows, the New York trade schools constitute the class, the system is to leave the general education to the public schools and confine the work to the manual instruction necessary to make a mechanic. The sessions are held three evenings from seven to nine thirty, of every week, and for five and a half months. The class in tailoring meets daily, from eight a. m. to five p. m. Efforts to establish day classes in other trades have, with the exception of plumbing, been unsuccessful. The admission age is 16 to 21, the tuition charge for the season \$15, \$16, and \$17 for carpentry, plastering, and bricklaying, respectively, and \$10 to \$12 for the other trades; the attendance for 1886-87 was 237, the first session, 1881, it was 20. The land and buildings cost \$56,000; the receipts for the last season were \$4,848, the expenses \$9,516. In a letter to the Bureau the proprietor, Richard T. Auchmuty, Esq., says: "The results of this experiment in industrial education have been most gratifying. The young men, after working for from six months to one year after leaving the schools, usually get full wages, if old enough to do a full day's work. That they are thoroughly taught in the science of the trade * * * was shown by the severe examination held by the committee appointed by the Master Plumbers' Association last spring."

REMARKS ON THE SUMMARY OF TABLE 67.

Omitting the statistics of the McDonogh Institute, of the manual training department of the Omaha High School, and of the technical school of the Carriage Builders' Association, which appear for the first time in the Table, there is an increase of 17 in the number of the instructors, of 1,326 in pupils, of \$18,120 in income, and \$10,150 in expenditure over the year 1885-86. In 1885-86 the average number of pupils to a teacher was 23, in 1886-87, 35; the per capita expenditure, excluding the students in institutions not reporting expenditure, in the former year was \$123 and in the latter year \$111. Excluding the statistics of the well-endowed Miller Manual Labor School for both years, and those of the McDonogh Institute for 1886-87, the per capita expense was \$78 for 1885-86, and \$66 for 1886-87.

INTRODUCTORY REMARKS.

The classes of persons whose education is treated of in this chapter may be placed in two categories, those whom nature, disease, or accident has placed at a disadvantage as compared with children possessed of a full complement of human faculties, and those who by reason of their social position or transgressions are unlikely to reach a higher level of intelligence unless assisted or coerced. The educational life here dealt with is institutional and it has the additional feature of being fostered by the general public, except in the case of the negro, for a very small proportion of itself, a fact that has not a little tended to give rise to the vicious propensity of looking upon these institutions as public charities rather than as public schools.

Schools or asylums.—Without touching upon the æsthetic side of the question of naming these institutions and the several classes whose instruction it is their purpose to accomplish, the practical evils resulting from what is indicated, or is supposed to be indicated, by the names they bear or have borne is here considered in so far as it interferes with the accomplishment of their specific object. It was stated by President Gallaudet, of the National Deaf-Mute College, in presenting his report as chairman of the executive committee of the Convention of American Instructors of the Deaf (see p. 824), that it was a matter of experience that children who are deaf but not dumb have found difficulty in securing the advantages to which the so-called deaf and dumb are admitted without question; and Superintendent Weston Jenkins, in his article on “Aphasia in Relation to Deafness” read before the Eleventh Convention of the Instructors of the Deaf, speaks as though it was a common thing for superintendents to receive application for the admittance of children who are described as “dumb but not deaf.” But it is among the institutions for the blind that, apparently, the greatest inconvenience is experienced. In its annual report for 1886, the board of trustees of the Texas Institution for the Blind, uses the following language: “In conclusion, we invite a careful perusal of the report of the superintendent, and would again impress the idea that this is not an asylum. * * * At least one citizen of a distant State travelled to Austin under the delusion that this was an asylum. * * * The con-

stitution never intended that it should be used as an 'asylum' and such nomenclature properly has no place in our statute books, and we trust that all legislation in the future will look to this important distinction." Superintendent Sibley, of the Missouri School for the Blind, issues a printed circular: "In view of the fact that a want of proper information on the part of the public concerning this school has been the cause of many blind children growing up in ignorance. * * * This institution is in no sense an asylum." Struggling against the same misconception Superintendent Jacobs, of the Indiana Institution for the Education of the Blind, remarks: " * * * Judging from the contents of many letters that I have received, there seems to be a lack of information relative to the real character and purposes of this institute among all classes of people. They fail to comprehend that this is not an asylum. * * *" Superintendent Miller, of the Ohio Institution, remarks that "An erroneous impression seems to exist * * * as to the intention of our institution. It is not a State infirmary, nor is it in any sense an asylum." Superintendent Clement, of the New York State Institution for the Blind, though not commenting on the evil complained of in the West, issues an "Address to the Parents and Friends of the Blind" ostensibly to advise the parent as to the course of home instruction to be pursued before the child is sent to school, but he carefully notes that the organic act declares "that the institution shall be considered as a department of public instruction." It will be observed that the new school for the blind in Alabama has received the name of Academy for the Blind.

The name "*reformatory*."—If the odium which attaches to the word "asylum," in which light it would seem the public persists in viewing the above institutions, their true names to the contrary notwithstanding, "has been the cause of many blind children growing up in ignorance," it may be supposed that the graduate of a reform school would be at some pains to conceal the name of his *alma mater* rather than undergo the worst evil to a reformed person of having been "in jail." Superintendent Mallalieu, of the Nebraska State Reform School, observes, in suggesting that the name of his institution be changed to State Industrial School that "the word 'reform' when applied to penal institutions carries with it a stigma. It is frequently a misnomer.¹ It projects itself into the future and springs up at the very time when the struggling youth is doing his best to lead an honorable life." The trustees of the Iowa school in recommending that the name be changed to the "State Industrial School" say: "The use of the name 'reform school' was considered inapplicable, although the school is reformatory in its work and character." Superintendent Charlton, of the Indiana School for Boys, however, takes another view of the matter, considering the question in the light of propriety of nomenclature and the life of the boy while in school. He very logically observes: "Let us call things by their right names. I try to impress upon every boy the fact that this is a reform school."

Attendance.—The attendance at these institutions suffers not only from the false conception of their object, but also from ignorance of their existence and, in some cases, a wilful neglect of the advantages proffered. Among several methods followed by superintendents of schools for the deaf to make the schools and their true character known (see page 822, Education of the Deaf—Convention), that pursued by Superintendent Noyes, of the Minnesota school, seems to be, not only ingenious in its conception and thorough in its operation, but highly valuable in its results. "That method alone," observed Mr. Noyes, "has given me tenfold more reliable information in the State of Minnesota than all the census returns that have been made, either by the national or State government, since that [the Minnesota] institution was founded."

This plan is based on the fact that a child in the public school will be more likely to know if there is a deaf and dumb child in the neighborhood than his father or his mother. Taking advantage of the superintendent of public instruction's annual distribution of blank forms to be filled out and returned, a table was added to the form; and on this, county superintendents and teachers were required to write the name, the age, and the parent's post-office address of each deaf or blind child in the State. The responses the State superintendent had tabulated and transmitted to Superintendent Noyes, who recommends that the word "dumb" be not used, "because some parties * * * make the same child deaf, dumb, and blind" quite contrary to the fact. The matter of attendance was not formally before the ninth biennial meeting of instructors of the blind, but the same ignorance of the existence of schools for the blind was adverted to by several members.

I.—EDUCATION OF THE DEAF.

I.—GENERAL REMARKS.

New institutions and buildings.—Three schools for the education of the deaf have been opened during the year and two provided for. Of the schools established those at Evansville, Ind., and La Crosse, Wis., are respectively a part of the common school sys-

¹ See page 856, Classification of pupils.

tem of the city, while that at Cincinnati, Ohio, is under the auspices of the Society for the Improved Instruction of Deaf-Mutes, of Cincinnati. The institution for the deaf and the blind lately established at Cheyenne by the Legislature of Wyoming is prepared to begin its work as soon as a sufficient number shall have presented themselves for instruction, and the institution for the education of the colored deaf and blind, provided for by the twentieth Legislature of Texas (1887), will be ready in September, through the activity of the three commissioners appointed to carry out the act and to whom the \$50,000 appropriated was intrusted.

Two schools have ceased to exist, the private school of Prof. A. Graham Bell, in Washington, and the St. Joseph's Deaf-Mute School, Hannibal, Mo., whose pupils have been removed to the Convent of Maria Consilia Deaf-Mute Institute, Saint Louis, Mo. The school in Baltimore, known as F. Knapp's Institute, is supposed to have been discontinued as a school for the deaf, as no information of it or from it as such has been received for several years.

The Kansas, Nebraska, Pennsylvania, Oregon, West Virginia, and the national institution have largely increased their accommodations. The central and the northern New York institutions are making preparations to begin the erection of institutional buildings, the State Legislature having appropriated \$40,000 to each; while the appropriation of \$40,000 by the Massachusetts Legislature to the Horace Mann School having been found inadequate to erect the building contemplated, work has not yet been begun. As to the plan and arrangement of these buildings, the Office possesses no information.

Changes of the year.—The changes in the management of the institutions for the class under review are few but marked. The Alabama Institution for the Deaf and Dumb and the Blind has been separated into its elements and an institution established for each class of its inmates; the New Mexico institution has been adopted by the Territory; and the New England Industrial School for Deaf-Mutes, Beverly, Mass., has, for the first time, been aided (to the amount of \$2,000) by the State. In the Pennsylvania and Wisconsin institutions the oral department has been enlarged, and in the former institution is now taught in a separate establishment. The "advanced class" of the Chicago schools for the deaf, or high school, in the language of the principal of this class of city schools, "bids fair to become an established feature, as it has done well and grows more and more useful." Another "experiment," the most important innovation of the year, has been the determination on the part of the board of directors of the National College to admit young women to the college on the same terms and conditions as have been applied to young men. The results will determine the future policy of the board.

Training of teachers for the deaf.—The normal department of the Eleventh Convention of American Instructors of the Deaf, the first of its kind, was opened on July 16, 1886, by its superintendent, Mr. Ely, of the Maryland School for Deaf and Dumb, in the following language:

"The first subject to be considered is primary language. * * * The idea is to have set before us here the methods of the class-room—how we begin, how we go on, what means we use to reach the minds of our pupils to illustrate certain things, to get over certain difficulties, and in the progress of the discussion it is expected that the teachers present will ask questions, make suggestions, and offer remarks from their places in the room. It is to be as informal as is consistent with good order." Mr. Weed, of the Pennsylvania institution, was in charge of the exercises of the section of language for primary and intermediate classes, and selected as topics for discussion: (1) Vocabulary; (2) tense; (3) correction of mistakes; (4) methods of review; (5) exercises most profitable for primary teaching. Then followed in order arithmetic, in charge of Mr. F. W. Booth; kindergarten work, in charge of Mr. Z. F. Westervelt; geography, under Mr. Weston Jenkins; natural science, in charge of Mr. F. D. Clarke; art, in charge of Mrs. A. J. Griffith; history, in charge of Mr. George Goodall; and the sections of sign language, Mr. I. L. Peet, of articulation and lip reading, Miss L. D. Richards, and of auricular instruction, Mr. J. A. Gillespie. Space is wanting to follow the discussions. It is necessary, however, to say that the presiding officer's expectation that questions would be asked was fully realized.

Miss Garrett, principal of the Pennsylvania Oral School for the Deaf, Scranton, Pa., devotes a portion of her time to training teachers in the oral method. The course continues 10 months—4 of observation and 6 of practice. Twenty of those who have received instruction at the school are engaged in teaching; the class for the year just closed consisted of 3. The National College at Washington has done so much toward furnishing the institutions of the country with teachers that, though its object is the higher education of the deaf, it may in a manner be regarded as a normal institution. Eighteen per cent. of those who have been connected for a longer or shorter time with the college have been engaged in teaching, and it is interesting to note that not infrequently their work has been that of pioneers.

Articulation.—The eclecticism and the intelligent advocacy of teaching the deaf to speak, and to read from a speaker's lips, as evinced in the resolution unanimously

adopted at the Eleventh Convention of American Instructors, contrasts with the enthusiastic preference given to the "pure oral method" by the Milan Convention,¹ representing the opinion on the continent of Europe.

The desirability of teaching the deaf to speak, and to read from the lips, is fully appreciated by American instructors, but experience causes them to doubt the possibility of the congenitally deaf acquiring these arts, except in cases of exceptional brightness. A trial of the combined system in its second and fourth features, Professor Fay's classification (see page 823, Convention), at the Pennsylvania institution, showed, after a trial of several years, the second method to be unsatisfactory as regards articulation and lip-reading, while in the trial of the fourth method the oral department was found worthy of being continued, though the "results were not such as its most ardent friends had expected." "It is believed," says Superintendent Crouter, of the Pennsylvania institution, "that a large percentage of our pupils, namely, the semi-mutes and the semi-deaf, and such of the congenitally deaf (few in number probably) as are capable of receiving oral instruction, can and should be orally taught, and that all others, forming, to be sure, the majority of the pupils, should be taught by manual methods" (see page 823, Convention). Calculations by this Office, based upon replies made to the inquiry of the editor of the *American Annals of the Deaf* and published in that journal, show that 36 of the schools reporting statistics for the year 1886 used the combined method exclusively, 13 the oral, and 10 the manual. Of the whole number of pupils (excluding the pupils of the New York institution) of these institutions (about 8,000), 32.5 per cent. were instructed in articulation. In the 45 institutions reporting teachers of articulation as such, the average number of pupils to a teacher is 15, so far as this is not modified by the fact that some of the pupils that appear in the aggregate were only present for a part of the year, causing this average to be too high. In the London city schools for the deaf, 10 is the maximum number committed to the charge of one teacher, and this number was one of the "six cardinal demands" of the schools for the deaf in Germany, almost unanimously adopted at the convention of German instructors of the deaf. The teachers of articulation formed 24 per cent. of the whole teaching body.

The oral branch of the Pennsylvania institution, above referred to, is taught in a separate establishment, with accommodations increased to admit 100 pupils. The Wisconsin institution has enlarged its oral department, which now receives the entire attention of three teachers; and the board of directors of the Oregon school asks the legislature to provide the means of employing a teacher of articulation. Two of the new schools of the year are oral schools, the Evansville, Ind., school being taught on the manual system.

Auricular instruction.—This lately introduced and rapidly extending method of instruction has been defined by the auricular teacher of the Nebraska institution, Miss Plum, as "educating the brain to use the hearing so that speech may be gained," and Professor Currier, of the New York Institution for the Education of the Deaf and Dumb, explains the phrase "aural development" as "the systematic training of an ear in abnormal condition to perform, with the aid of mechanical contrivance, the operations just described [the operations of the ear in a normal state]." To ascertain the number of semi-deaf, the tests made, and the number taught auricularly in the schools for the deaf, Superintendent Gillespie, during 1885-86, sent out a series of questions to the various institutions and received answers from 35. To the first question, "Has there been a general test of the hearing made in your school?" 22 answers are in the affirmative. To the question, "How many have you found with sufficient hearing to distinguish vowel sounds?" the 22 institutions answering the previous question in the affirmative, answered, collectively, 80. To the question, "How many have you taught wholly aurally?" the answer was 35, including the Nebraska in-

¹ The resolutions adopted by the international convention at Milan were as follows:

"1. The convention, considering the incontestable superiority of speech over signs, (1) for restoring deaf-mutes to social life, (2) for giving them greater facility of language, declares that the method of articulation should have the preference over that of signs in the instruction and education of the deaf and dumb.

"2. Considering that the simultaneous use of signs and speech has the disadvantage of injuring speech and lip-reading and precision of ideas, the convention declares that the pure oral method ought to be preferred."

The American instructors embodied their views in the following preamble and resolutions:

"Whereas the experience of many years in the instruction of the deaf has plainly shown that among the members of this class of persons great differences exist in mental and physical condition, and in capacity for improvement, making results easily possible in certain cases which are actually unattainable in others, these differences suggesting very widely different treatment with different individuals: It is therefore

"Resolved, That the system of instruction existing at present in America commends itself to the world, for the reason that its tendency is to include all known methods and expedients which have been found to be of value in the education of the deaf, while it allows diversity and independence of action, working at the same time in harmony, and aiming at the attainment of a common object by all.

"Resolved, That earnest and persistent endeavors should be made in every school for the deaf to teach every pupil to speak and read from the lips, and that such efforts should only be abandoned when (after thorough tests by experienced teachers) it is plainly evident that the measure of success attainable is so small as not to justify the necessary amount of labor."

stitution. To the inquiry, "How many are taught both aurally and orally?" intended to bring out the number taught with a view to cultivating the hearing, the answer was 399. Superintendent Gillespie, of the Nebraska institution, stated in the Eleventh Convention, at Berkeley, that experience had convinced him that his previous estimate of 15 per cent. was not too low as an estimate of the pupils at schools for the deaf who have sufficient hearing to be developed. At the Mississippi institution during 1885 a class of 10 were daily instructed in this method, and, although 5 could not at first distinguish vowel sounds, they could at the close of the year distinguish words and sentences.

Periodicals.—Of the two journals that are not issued by institutions for the deaf, one, the American Annals of the Deaf, particularly demands attention as an educational publication of the highest class. This journal, 79 per cent. of whose running expenses are derived from assessments on American and Canadian institutions, contained during the year under review twenty-eight articles, three-fourths of which are of a pedagogical nature, the others being historical, biographical, or casual articles relating to persons or subjects connected with deaf-mutism. These constitute the general and largest part of each quarterly issue; the minor departments being a department for notice of the current literature of deaf-mutism, a school-items department, and a department of announcements, and record of current events. The articles, original or translated, are written, with but few exceptions, by instructors. In the other periodical, the Deaf-Mutes' Journal, social rather than educational information predominates. Besides these, the educational and the social journals of the deaf world, there is a class of periodicals printed for, and very frequently, if not in every case, by the pupils of the several institutions.¹ The potential value of these papers, and that their influence is not confined to an institution, was happily illustrated by Superintendent Westervelt during the session of the normal section of the Eleventh Convention, at the close of Miss Harris's account of her method of teaching language at the Maryland institution. He said: "Would it not be a benefit to the profession and to all the institutions where papers are published, if such work as this done by Miss Harris were printed in such paper for the benefit of other institutions? * * * We all look through the institution papers, and we are very glad to get hold of something of this kind."

Convention.—As the proceedings of the Eleventh Convention of American Instructors of the Deaf, at Berkeley, Cal., July 15-22, 1886, cover 320 pages of an octavo volume, it is impossible to do justice to them in a few paragraphs. A faint sketch of the proceedings of the normal department has been given under "Training of Teachers." Those desirous of information as to the intimate or social side of a transcontinental trip that appears to have been as pleasant as long, are referred to the article in the American Annals of the Deaf,² and those who wish the full information, that can not be given here, to the volume of the proceedings.³ In calling the convention to order President Gallaudet, of the National College, gave a historical view of the previous conventions which, as a series, may be separated into two periods; the first from 1850 to 1858, held at intervals of about two years, with an attendance on the average of 35, representing from 3 to 10 institutions; the second, inaugurated after an interval of 10 years, at intervals of 4 years, and a constantly increasing attendance, until at Berkeley 41 institutions were represented by 230 delegates.

At the opening session Mr. I. N. Tate's paper on the means of securing a better attendance at schools for the deaf called forth the discussion intended, Rev. Thomas Gallaudet recommended a multiplication of institutions to accomplish the end, a proposition that was opposed by Mr. Erastus Brooks, of New York, as tending to weaken the power that could only be had by having one institution, and by Miss Black, principal of the Rhode Island school, who observed that notwithstanding the small extent of Rhode Island, not more than a fourth of the deaf children in the State could be gotten into the school. Dr. Peet advocated exhibitions at a central point in the State, as well as at home; Mr. Williams operated by sending out letters; President Gallaudet advocated the teaching of the manual system of conversing in the public schools; and Mr. Noyes gave his ingenious scheme, fully stated in the introduction of this chapter, for finding out deaf children. The session of the 16th was closed with a paper by Mr. James Denison, on "The Manual Alphabet as a Part of the Public School Course," a paper briefly anticipated the day before. As the utility of the proposition met with the unanimous support of the convention⁴ and may not be self-evident, the reasons for introducing this study into the public schools are given quite fully.

¹ The Office takes occasion to thank the superintendents of the Nebraska and Ohio institutions for their courtesy in sending it the Nebraska Mute Journal and the Mutes' Chronicle, respectively, during the year, and the editor of the Deaf-Mutes' Journal for a similar favor.

² Vol. XXXI, p. 244-252.

³ Proceedings of the Eleventh Convention of American Instructors of the Deaf, Sacramento, Cal., 8vo., pp. 328. To be had of Superintendent Wilkinson, of the California Institution, Berkeley. The postage is 7 cents.

⁴ By unanimous vote the executive committee of the convention was requested to have this article printed in the American Annals of the Deaf, and to "memorialize the Department of Public Education at Washington on the subject, and that the principal of each institution in the United States be appointed a committee to memorialize the department of public instruction in that State to the effect that the recommendations of this paper shall be carried out in the public schools."

"There are indisputably times and places in which the finger alphabet fulfills, as writing can not do, the conditions of expression where vocal utterance is either not desirable or not possible. * * * How often at social gatherings * * * do we see individuals separated from each other by the crowd or the length of the room, vainly striving * * * to convey * * * information. * * * In concerts, * * * in the church, * * * in the theatre, * * * and amid the noise and rattle of the machine-shop, factory, or railroad, how often arises an imperious necessity for making a communication to another. * * * Outside of the confessedly deaf, how many persons there are who * * * are yet hardly ever addressed except in tones more or less raised above the conversational pitch. * * * To the invalid and to the sick room the manual alphabet comes, as it were, with healing on its wings. * * * How many last messages * * * have been lost to the loving ones remaining behind; lost because the finger alphabet was not known." Mr. Denison then discusses the advantage of the manual alphabet to the hearing child as a student of the orthography of the English language, because "the more varied the form under which language is presented to the mind through the different senses, the more perfect will be the knowledge of it acquired and the more permanently will it be retained." Mr. Denison concludes with stating the undoubted benefits accruing to the deaf from ability to converse with the general public.

Saturday was a holiday, Sunday was devoted to the discussion of Sabbath Exercises in an institution for the deaf and dumb, and Monday to the great questions of the day in deaf-mute instruction, the relative merits of the oral, the manual, and the combined methods. Professor Cronter, in his paper on "The True Combined System of Instruction"—after quoting Professor Fay's subdivisions of the combined method into four classes, (1) the use of signs and articulation concurrently in the same class; (2) special classes in which lip-reading and articulation are taught as an accomplishment; (3) separate oral and manual classes in the same school; and (4) separate oral and manual schools or departments in the same institution—objected to the concurrent use of signs and articulation in the same class, since the "methods are diametrically opposed," and the semi-mutes are compelled to attend the advancement of the congenitally deaf, which is slow. To teaching articulation and lip-reading as an accomplishment he also objected as producing results inferior to the pure oral method. In the practice of the third species of the combined system, in which pupils are instructed in different classes by the oral or by the manual method, but are permitted to use signs on the play-ground, Mr. Cronter had found that such use of signs had tended to improve the pupil's intellectual faculties; he pronounced, however, for the fourth system of instruction in the following terms: "For all practical purposes and in order to secure immunity from error in the choice of methods, I would divide the deaf into three classes,—the congenitally deaf, the semi-deaf, and the semi-mute. With the first I would include those born deaf and those who lose their hearing from accidental causes very early in life, say within the age of three or four years. These, for the most part, I would instruct manually. The semi-mute and the semi-deaf, and such of the congenitally deaf as appear particularly bright and quick to learn, I would instruct orally." Professor Cronter's remarks are of especial interest, as the institution over which he presides is "working out for the benefit of the American schools," to quote from the paper that followed by Dr. Peet, "a most interesting problem" (see p. 821). Dr. Peet, in his paper on the combined system, after summarizing the progress of manual and oral instruction in this country, proceeded to describe the methods pursued in the New York institution, where, "Except in what we call our kindergarten department, the hours of instruction for each class are four daily. The first hour is devoted to the recitation of the lesson conned in the study hours out of school; the second hour, to exercises in the English language; the third hour, to arithmetic; and the fourth hour, to lip-reading and its corollary, articulation." Mr. G. O. Fay, in his paper on "Comprehensive Education in its Philosophy and Practice," advocated, in order "to secure the best results in existing institutions, sign and oral," a reorganization, gradual or summary; for, though the schools of France for a century, and of this country "have demonstrated only and mainly * * * the importance and possibilities of pantomime and the uses of the manual alphabet, supplemented by written speech, * * * and have produced a remarkable body of silent scholars, easily superior to anything that "oralists have been able to produce," they have been backward * * * in taking up and applying with equal skill and energy the teaching of oral speech." On the other hand, the schools devoted to the pure oral method of instruction "have yet to learn that in omitting the use of pantomime and finger spelling they ignore the uneducated mute's best friend. They take away a ladder, the only ladder known, by which all the deaf can easily rise." The reading of these papers was followed by a keen, though not acrimonious, colloquy as to the probability of error in a segregation of pupils unfit for oral instruction, that was not founded on a long trial, and even re-trials. The discussion was interrupted by Professor Gallaudet, president of the National College, who introduced the resolutions already given (p. 821, note), which, after some amendments in the interest of oral and auricular instruction, were unanimously passed.

The first paper of the following day was by Professor F. D. Clarke, of the Arkansas School, on "Technical Education." Mr. Clarke stated that the California institution was the only one that followed the Russian system of technical instruction, and that, only in the wood-working feature of the system, and that at no institution, so far as he was aware,¹ "is there any regular course of [technical] instruction, any examination, or any attempt at either." He advocated a manual-training course of four years; the pupil during the first 2 years to be instructed in the use of tools in a general way, and during the last 2 made a specialist of. The convention then unanimously adopted the report of the standing executive committee to discontinue the use of the word "dumb" in the title of the convention and of the publication until then known as the American Annals of the Deaf and Dumb. Mr. Chickering's paper on "Physical Culture," not intended "to offer anything new or original," presented the methods and results of physical education at the National College; his testimony as to the value of the exercise to the deaf was corroborated by Professors Fay and Noyes. Miss Garrett's paper, entitled "A Summary of Work done in the Pennsylvania Oral School for Deaf-Mutes, Scranton, Pa., June 18, 1886," stated that the object of the author's school was to develop speech and language, for, if the work is well begun, it will be a comparatively easy matter to instruct the pupils in the ordinary branches later." "If the school were larger," continues the essayist, "I should classify it as I did in [the] oral branch of [the] Pennsylvania institution—placing semi-mutes, semi-deaf pupils, and congenital and practically congenital, each in separate classes; of course sending semi-mutes and semi-deaf pupils to hearing-schools as soon as possible." After taking action in the matter of President Gallaudet's invitation to appear before the royal commission to inquire into the education of the blind and the deaf in Great Britain and Ireland (see Bureau Report, 1875-86), the following resolution was introduced and unanimously passed:

"Resolved, That, in the opinion of this convention, instruction in art is of special importance in the instruction of the deaf, as without its guiding and developing influence the peculiar tendency of the deaf-mute's mind to think in pictures can not be taken advantage of to place him on that plane in life to which he is best adapted, nor can that superiority in handicraft of whatever kind which he is capable of attaining be placed within his grasp."

The evening of the 21st was spent in discussing auricular instruction (see p. 821, Auricular Instruction); the day following was taken up with the closing exercises.

II. NOTES FROM CATALOGUES.

ALABAMA.

Alabama Institution for the Deaf (formerly *Alabama Institution for the Deaf and Dumb and the Blind*), Talladega, Ala.—The oral class recently established in this institution numbered 16, the pupils' ages ranging from 8 to 22 years. They had at the date of the report acquired a vocabulary of 450 words, quite a number of short sentences, and could count and add very well. Industrial training has been reduced to a minimum from want of room, a state of affairs that the erection of the department for the blind into a separate institution and its removal will remedy.

COLORADO.

Colorado Institute for the Mute and the Blind, Colorado Springs, Colo.—Of the 92 persons admitted to the institution and of whom a record was obtained, 30 per cent. were congenitally deaf, though no pupil had had deaf parents. Signs are used freely, while those showing aptitude are also instructed in articulation and lip-reading; some pupils being quite proficient in both. Printing and carpentry are taught as trades.

CONNECTICUT.

American Asylum for the Education of the Deaf and Dumb, Hartford, Conn.—Forty-one per cent. of the 289 pupils admitted since 1877 to this long-established school were born deaf, and 57 per cent. of those born deaf were children not having deaf-mute relatives; 23 per cent. having deaf relatives belonged to 47 families, having in all 240 children (154 hearing and 86 deaf), of whom 64 per cent. were not deaf. The increase in the attendance in the articulation department necessitated the employment of a third teacher of articulation and lip-reading. In this school all new pupils are thoroughly tested as to their ability to continue in it with profit; 68 have been under instruction during the year. Of the 134 pupils in the school at the date of the report, 23 were supported by the State of Maine, 21 by New Hampshire, 17 by

¹ This system had been introduced into the Virginia institution at the date of its report for 1885-86, p. 8.

Vermont, 62 by Massachusetts, 5 by Rhode Island, and 56 by Connecticut. Referring to the objection urged against the combined or eclectic system as occupying the greater part of the pupils' time with the sign language, Principal Williams observes that it certainly does not hold against his school, and that signs are used "as a valuable aid, and only as an aid."

Whipple's Home School for Deaf-Mutes, Mystic River, Conn.—This school is taught wholly on the oral system. The course of study is lip-reading and articulation, language, arithmetic, geography, and history. The boys are taught farming and gardening. The school is partly supported by the State and partly by contributions.

DISTRICT OF COLUMBIA.

National Deaf-Mute College, Washington, D. C.—This, the initial effort to secure to a constantly increasing class the advantages of a rigid and thorough course of intellectual training, was partly instituted to prove that the deaf were capable of profiting by the opportunities it afforded; a theory that the experience of 23 years and the occupations of the alumni have demonstrated. Of the 293 students who have been for a longer or shorter period connected with it, 50 have engaged in teaching, 1 is a minister, 6 have been connected with newspapers as editors, writers, or publishers, 10 have entered the civil service, 2 are scientists, and 2 have held municipal offices. Some have entered business offices as subordinates, while others have embarked on their own account, and many have become farmers and mechanics. The sections of the Union have been represented as follows: New England, 43; Middle States, 58; Southern States, 67; and the West, 130.

The liberality of Congress has been marked and uniform. It has not only provided for the current expenses so liberally as to enable the college authorities to assist indigent students, but has appropriated from time to time over \$400,000 for the splendid college buildings and the extensive grounds by which they are surrounded. The institution, however, has not been wholly dependent on the national treasury. In its early days scholarships were maintained by distinguished citizens of the capital, and to accomplish the purchase of the last and largest addition to the grounds there were many contributors.

The college does not attempt the work of a polytechnic school nor of a university. Its curriculum of four years consists of studies in ancient and modern languages, in natural and political science, and in philosophy and in history. This course, which leads to the degree of B. A., is introduced by a course of instruction lasting a year. Greek, analytical geometry, and the calculus are optional. Latin is finished with the first term of the sophomore year, and English and mathematics are prominent by reason of the continuity with which they are pursued. Candidates for admission are examined as to their ability to converse (oral or finger spelled), to render at sight paragraphs from school-books or newspapers; to compose extemporaneously; and are examined in the studies of the common school.

GEORGIA.

Georgia Institution for the Education of the Deaf and Dumb, Cave Spring, Ga.—The school at the date of the last report had not yet occupied the new building, for which an appropriation of \$5,000 was made in 1880 and an additional sum of \$10,000 by a subsequent Legislature; to complete and equip the building will require \$6,000 more. In the school the usual branches are taught; in the industrial department the boys are taught shoemaking.

ILLINOIS.

Ephpheta School for the Improved Instruction of Deaf-Mutes, Chicago, Ill.—This school, though appearing in the table for the first time, was established in 1884, and has been sustained by the Ephpheta Society (an incorporated association of Roman Catholic ladies); tuition is free. The addition of an industrial department is under consideration, while the formation of a library has already been begun.

Chicago (Ill.) City Schools for the Deaf.—These schools, of which at the date of the last report there were 5, are taught on the manual system. There is, however, a class in articulation and lip-reading. In a letter to this Office transmitting statistics, Superintendent Emery remarks: "Seven deaf boys from the advanced class and Scammon Primary Mute School, ranging from 14 to 21 years of age, have entered the industrial school of the city board of education. So far they are holding their own with those who hear and speak. This * * * overcomes the greatest and only serious objection to mute day schools."

Illinois Institution for the Education of the Deaf and Dumb, Jacksonville, Ill.—Of the 1,613 pupils of whom the cause of deafness was reported, 30 per cent. were born deaf. Since 1845, 1,886 pupils have been admitted into the institution, representing

1,706 families; 90 per cent. of these families had each one deaf child (pupil in the institution), 6 per cent. 2 deaf children, and 4 per cent. 3 or 4. "Of the deaf-mutes who have been connected with the institution as pupils and have left it, 251 have married deaf-mutes, and 19 have married hearing persons. These marriages have been as fruitful in offspring as the average of marriages in society at large, some of them resulting in large families of children. Among all these only 16 have deaf-mute children. In some of the families having a deaf child there are other children who hear." After discussing the evils of non-attendance on the opening day of the school, the fallaciousness of per capita comparisons of the cost of one institution with that of others of a different kind, or of the same kind but of a different environment, the superintendent asks for an appropriation of \$3,000 to erect a cottage for little girls. The gymnasium, for which \$6,000 was appropriated, was nearly completed at the date of the report.

KANSAS.

Kansas Institution for the Education of the Deaf and Dumb, Olathe, Kans.—Articulation and lip-reading are taught to those who show aptitude, about one-sixth of the whole number. The school is divided into 12 classes under as many teachers. In the mechanical department, cabinet-making, carpentry, shoemaking, and printing are taught by competent foremen.

MASSACHUSETTS.

New England Industrial School for Deaf-Mutes, Beverly, Mass.—Articulation is taught to a greater extent than ever before. The course covers the usual common school studies.

Horace Mann School for the Deaf, Boston, Mass.—Although by a recent act of the Legislature the school is now one of those at which pupils may be maintained at the expense of the State, it still remains under the control of the school committee of the city. The want of provision for industrial instruction has compelled the institution to depend upon the courtesy of the North Bennett Street Industrial School and the Tennyson Street Cooking School for such instruction. The primary classes have been much assisted during the year by printed language lessons that private contributions enabled the principal to provide.

MICHIGAN.

Michigan Institution for the Education of the Deaf and Dumb, Flint, Mich.—Of the 336 pupils enrolled during the biennial period covered by the report (1885-86), 19 per cent. were congenitally deaf. In 1855-56, the third year of this school's existence, 18 deaf children were admitted; in 1865-66, 14; in 1875-76, 39; 1885-86, 58. The course covers 10 years, 5 of which are passed in the primary department, 3 in the grammar, and 2 in the academic. As those who enter the school are, with few exceptions, destitute of language, the first 4 or 5 years of their school life are consumed in its acquisition. The general method of instruction pursued is the combined, its elasticity and flexibility rendering it adaptable to the condition of the pupil. Without intending in any way to reflect upon the value of the work done in the articulation department of his school, the superintendent recommends that an oral department, in which promising pupils are to be taught wholly by the oral method, be established at an early day. The 304 pupils enrolled in 1885-86 were taught as 19 classes by 15 teachers, an average of 16 pupils to a class and of 20 to a teacher. Referring to the new study of drawing, the superintendent remarks: "What at the beginning of the year was an * * * experiment * * * has become a decided and well-determined success." In the cabinet-shop (23 pupils), in the shoe shop (28 pupils), or in the printing-office (12 male and 7 female pupils), the pupils above the primary grade spend half of the school day.

NEBRASKA.

Nebraska Institute for Deaf and Dumb, Omaha, Nebr.—Of the 244 children that have attended the school since its opening, 32 per cent. were reported as congenitally deaf. The auricular work, adopted as a special feature of the institution, gives great promise of beneficial results. As an experiment the school has been divided into three divisions, one working in the shop while the others are in school, for the purpose of giving the pupils more thorough manual instruction without taking from their school time. Drawing, pencil and crayon, has been introduced and taught to 60 pupils with highly satisfactory results. In the industrial department, printing, carpentry, engraving, and carving are taught the boys.

NEW JERSEY.

New Jersey School for Deaf-Mutes, Trenton, N. J.—Of the 109 pupils in the institution at the beginning of the school, 35 per cent. were between the ages of 15 and 18,

26 per cent. of 8 and 12, 25 per cent. 12 and 15, and 14 per cent. of 18 and 21; 51 per cent. were born deaf. "Special and continued instruction is given in lip-reading and articulations with varied success." The recent act of the Legislature, appropriating money for the establishment of a system of mechanical instruction, has led to the enlargement of the shoe shop and the introduction of the machinery necessary to teach the trade on a larger scale; a room has been fitted up as a carpenter shop, and another provided with a printing-press. The superintendent regrets that circumstances have as yet prevented him from giving auricular instruction the attention that its promise deserves.

NEW YORK.

Le Coucoux St. Mary's Institution for the Improved Instruction of Deaf-Mutes, Buffalo, N. Y.—Of the 139 pupils in the school at the close of the year covered by the report, 87 were State pupils and 27 county; 19 were supported by parents or guardians, and 6 were charity scholars. The method of instruction is the combined articulation. "The greater number of those who have been born deaf, or who have lost their hearing in infancy, make comparatively small gain in speech and in lip-reading, though still enough to be useful to them in their homes and among their friends." The boys, according to their individual aptitude and taste, are taught printing, tailoring, or shoemaking. The principal remarks that printing not only is attractive to the students, but that the trade promotes their intellectual growth, adding: "Many of our former pupils are now filling lucrative positions in newspaper and job-printing offices in various parts of the country."

St. Joseph's Institute for the Improved Instruction of Deaf-Mutes, Fordham, N. Y.—Although the system of instruction has not radically changed, "there has been a steady advancement from the combined to the oral in the classes where the former system is still in use." The studies are those of the public schools. Shoemaking and tailoring are taught the boys.

Northern New York Institution for Deaf-Mutes,¹ Malone, N. Y.—Of the 56 pupils connected with the school during the year covered by the report, 46 were supported by the State and 10 by counties. Speaking of the method of instruction followed at his school the superintendent says: "We do not use signs as an end in this institution. * * * Even for the most advanced and intelligent deaf-mutes and, I may add, semi-mutes the explanation of difficult words and phrases by signs is of great value; but for beginners, and those whose mental faculties are of the lowest order, they are indispensable." As the parents of several pupils having some power of speech desired that their children should retain it, a teacher was detailed to instruct such pupils in articulation and lip-reading, a temporary arrangement until the services of an articulation teacher can be obtained. After commenting on the difficulties of instructing the deaf, the superintendent remarks: "It is very unfortunate that so many of our pupils arrive at the institution at an age when the difficulty of imparting instruction to them is doubled. Their most impressive years are gone, and they generally find it a task of no small moment to retain in the mind what they commit to memory."

Institution for the Improved Instruction of Deaf-Mutes, New York, N. Y.—The number of State pupils instructed during the year was 103; county, 66; paying tuition, 19; and charity, 1. There were 14 classes, under 4 male and 10 female teachers. The institution has of late received a considerable number of very young pupils, touching the education of whom the superintendent remarks: "Now, in my experience I have found that those deaf-mutes make the most satisfactory progress in speech and lip-reading whose instruction is commenced when they are 8 or 9 years old. * * * All that can be done with such young children is to prepare them for the regular school work, which they have to begin when they are old enough for it." To meet the requirements of this class a preparatory department was organized, with a curriculum consisting of calisthenics, kindergarten work, writing, lip-reading, and, for 2 hours daily, preliminary voice-training. An important advance has been made in the method of teaching science. This consists of a system of object lessons, reinforced and invigorated by a continuous series of succinct questions admitting of concise responses, for the purpose of familiarizing the pupils with those principles of physics, chemistry, and geometry that are most applied in the workshop. In the industrial department instruction is given to the larger boys 4 afternoons in the week, the object being not to teach, as yet, trades, but general mechanical principles. For the girls, in addition to the usual sewing, cutting, and fitting, there is a well equipped cooking school; they are also taught drawing and, to those showing talent, painting.

¹ In his remarks at the convention at Berkeley, on the desirability of multiplying institutions for the purpose of increasing attendance (see page 822, convention), Rev. Thomas Gallaudet says of this institution: "There is a singular fact with regard to this school. The majority of the young men are over eighteen years of age—men who had grown up in ignorance, twenty, twenty-two, and twenty-four years of age. You could see the results of training, even in their physical condition, in the way they looked and carried themselves. I saw them when they began, some two years ago."

NORTH CAROLINA.

North Carolina Institution for the Deaf and Dumb and the Blind, Raleigh, N. C.—Of the 5 classes in the department for the deaf, 2 are taught by the oral method. Shoemaking is the only trade taught, but others are asked for, especially printing. The number taught during the period covered by the report was 26; the girls receive instruction in sewing.

OHIO.

Cincinnati (Ohio) Deaf-Mute School.—The average attendance during the year was 29 in this school, 20 having attended for the whole session of 10 months, and 5 from 8 to 10 months. All studied reading, orthography, writing upon slates, arithmetic, penmanship, and composition; 6 geography, and 6 history. 44 were 10 or under, and 30 were 13 or 14 years of age. The school was taught in two school-rooms having accommodations for 40 pupils.

The Oral School for the Deaf, Cincinnati, Ohio.—This school, the purpose for which the Society for the Improved Instruction of Deaf-Mutes was formed in August, 1886, offers instruction in the purely oral method. In many instances the society assumes the expense of educating the child whose parents or guardians are destitute. For the year under review the work of the society was facilitated by permission to use for school purposes a room in the Children's Home free of rent; a class of 10 was soon formed, and placed under competent teachers. In regard to the success of the school the executive committee observes, "The work accomplished was in every respect gratifying. * * * The executive committee of the society is confident that the work to be accomplished during the present year will increase the usefulness of the school and that it will illustrate practically the main objects and purposes of the work, and typify it not alone as an educational effort but also a desirable charity."

Ohio Institution for the Education of the Deaf and Dumb, Columbus, Ohio.—The whole number of students instructed here has been 2,152, of whom 31 per cent. were born deaf (excluding 80 not reported). Excluding those whose age, at time of becoming deaf, was not reported (411) and those born deaf, 34 per cent. were over 3 years old when deafness occurred. The industrial department is organized on a very practical basis; in the printing-office (38 pupils) the printing for the State agricultural board is done, as well as the job work of the institution; in the shoemaking shop (47 pupils) shoes are made and repaired for the inmates at the expense of their parents, \$1,500 for the year covered by the report; and the repairs, extensions, and alterations necessary to so large an establishment are done by the carpentry class (28 pupils). To these occupations is to be added tailoring.

OREGON.

Oregon School for the Education of Deaf-Mutes, Salem, Oregon.—The present condition of this school contrasts strongly with its original quarters in an utterly inadequate, rented building. The institution now owns 3 fine buildings adapted to the purposes of the school, provided by funds not granted by the State. Articulation is taught every afternoon to those who seem qualified to make progress in it. The great want of the institution is an industrial department.

PENNSYLVANIA.

Pennsylvania Oral School for the Deaf, Scranton, Pa.—The appropriation for a building for this school having been vetoed by the governor of the State, the school can offer its advantages only to those who reside in the vicinity, which greatly interferes with the attendance. The president of the board of directors observes: "The success of the school and advancement of the pupils under our care has been a marvel to those who attended the exhibitions. * * * We can only reiterate what we have expressed before, and experience shows, that the unfortunate deaf children are able to become speaking men and women and to all appearances as those that hear." Miss Emma Garrett, the principal of the school, a teacher of experience, and an advocate of the pure oral method, also devotes a portion of time to normal training as referred to under Training of Teachers, p. 820.

The Western Pennsylvania Institution for the Instruction of the Deaf and Dumb, Wilkensburg, Pa.—Of the 173 pupils under instruction for the year ending September, 1886, 31 per cent. were reported as born deaf, excluding these and those who became deaf before completing their third year, and the unknown cases (4), 23 per cent., lost their hearing after entering upon their fourth year. The system of instruction pursued is the combined, but it is sought as far as possible to adapt the method to the evident needs of the pupil rather than the pupil to general theories. The results of instruction in articulation and lip-reading are encouraging, and children likely to derive benefit from this method are daily exercised in vocalization and lip-reading.

under the supervision of an experienced instructor. Two pleasant rooms have been fitted up as a library, and books will soon be provided by the income from a fund of \$5,000 lately given by Andrew Carnegie, Esq. In the industrial department instruction is given in carpentry, shoe and cabinet making. It has been determined to discontinue the holiday vacations, the authorities having been induced to take the step from having imposed upon them 40 cases of mumps resulting from contact with a pupil who had contracted the disease while at home during the vacation at Christmas, and 21 cases of measles propagated by a pupil who had caught the disease while at home at Easter.

RHODE ISLAND.

Rhode Island School for the Deaf, Providence, R. I.—The aim of this school is "to teach deaf children to use the English language with the spontaneity, correctness, and enjoyment of *hearing* children, as far as this is practicable." To attain this end it is very desirable that children be sent to school even at the age of 5 or 6. Prizes are offered for progress in articulation and speech-reading. The course of instruction is thoroughly graded into 4 divisions of two years each. There appears to be no industrial department, but it is noted that two pupils took lessons in drawing in the Rhode Island School of Design and two others have attended an industrial school on Saturdays. The great want of the school is a boarding department.

SOUTH CAROLINA.

South Carolina Institution for the Education of the Deaf and Dumb and the Blind, Cedar Spring, S. C.—The west wing of the building having been completed during the year covered by the report, it was occupied during the last term. Articulation is taught.

VIRGINIA.

Institution for the Education of the Deaf and Dumb and of the Blind, Staunton, Va.—The course of study has been lengthened one year by the addition of a higher class (the seventh class of the school) which gives effect to the provision which allows the pupil seven years of instruction. By a systematic series of efforts the superintendent has brought the number of pupils present on the first day of the session from 35 in 1884-85 to 68 in 1886-87, thus enabling the school to organize immediately. The class of articulation for 1886-87 consisted of the new scholars and of 25 pupils selected from the two classes of the previous year. The number of these, too large for one teacher, will be decreased by the removal of those not benefited by the instruction. The boys are daily instructed for 3 hours in some handicraft that will enable them to support themselves after leaving school. The Russian system of industrial instruction has lately been introduced into the wood-working shop which has been enlarged to accommodate the new machinery.

TENNESSEE.

Tennessee School for the Deaf, Knoxville, Tenn.—Articulation and lip-reading, taught under the method known as the combined, is steadily growing in favor at this school. The average attendance for the period covered by the report was 103, a number that it is thought should be increased by 25 per cent. Discussing the query, "Are we doing as much as we ought for the deaf of Tennessee?" the superintendent observes: "Most of our young men who wish to attend the National Deaf-Mute College leave us to enter the preparatory department of that institution. I think that we should, at least, with other institutions, fit pupils for the introductory class, * * * and that we should give those boys and girls whose school life will end when they leave us * * * a mental equipment more nearly equal to that of their hearing companions who have received the benefits of the public schools."

TEXAS.

Texas Deaf, Dumb, and Blind Institution for Colored Youth, Austin Tex.—Through the kindness of Z. F. Fulmore, Esq., of Austin, to whom, by the courtesy of Superintendent Rainey of the School for the Blind, the Commissioner's letter of inquiry was referred, the Office has been informed of the circumstances under which this institution has lately come into life. In 1887 the Legislature provided for an institution, appropriated \$50,000 for its establishment, and appointed three commissioners to carry out the act, of whom Mr. Fulmore was one. Uninformed as to the number of

children who were entitled to become beneficiaries, or who would avail themselves of their privilege, the commission entered upon a double line of activity, appointed a superintendent (a colored citizen, the members of the commission are not colored), whose first duty it was to collect statistics and purchase 100 acres of land. The buildings on this farm were re-adjusted and added to in order to accommodate the 50 children that the superintendent soon reported would attend. The school is sufficiently supplied with apparatus, is out of debt, and has funds to carry it on until the next Legislature will have appropriated for its further support. The deaf pupils will be in a large majority.

WISCONSIN.

Oral Department of the Public Schools, for the Instruction of Deaf-Mutes, La Crosse, Wis.—This school has been organized under the statute of 1885 of Wisconsin. That it is a day school taught on the oral method is indicated by its name. Other than that contained in the table, the Office has no information.

WYOMING.

Wyoming Institution for the Blind and the Deaf, Cheyenne, Wyo.—Through the courtesy of George C. Rafter, Esq., of Cheyenne, the Office has been put in possession of the following facts in regard to this as yet unopened institution: The Legislature of 1886 appropriated \$8,000 to defray the expenses of a school for the blind and deaf for two years, providing that the school should not be opened until an attendance of 12 was assured. The commission to whom the plan and the money were entrusted did not delay to purchase a block of land and erect a suitable building, which is now ready for use. The next Legislature will be asked to remove the condition of opening and to provide liberally to carry on the work.

^a Pupils of institutions not reporting expenditure excluded in making the computations contained in the column.

^b Pupils of institutions not reporting value of property excluded in making the computations contained in the column.

^c Dr. G. O. Fay stated at the Eleventh Convention of American Instructors of the Deaf that the ratio, speaking generally, is three males to two females, *i. e.*, 60 to 40 in the hundred.

During the interval from 1882-83 to 1886-87 the table shows that the net increase in the number of schools has been 9. It remains to indicate how this increase has obtained. Of the 65 schools in the table for 1886-87, 14 have been established since 1883; 6 of them State or Territorial institutions, 5 day schools, 1 a private boarding school, and 2 schools for the instruction of children of Catholic parents. To these are to be added the recently founded public institutions in Wyoming and Texas, both dual institutions. Five schools in the table of 1882-83 do not appear in that of the present report. They are located respectively at Baltimore, Md., Marquette, Mich., St. Joseph, Mo., and Erie, Pa., while the oral department of the Pennsylvania institution is not now, as it was in 1882-83, reported separately. Four of the schools established during this interval use the oral method exclusively; 3 of them belong to the public school system of the town or city in which they are situated.

II.—EDUCATION OF THE BLIND.

I.—GENERAL REMARKS.

New institutions and buildings.—Three institutions for the blind have been established during the year. Two, the Wyoming and Texas institutions—the latter for colored persons—are also for the deaf, and one, the Alabama Academy for the Blind, was formerly the blind department of the Alabama Institution for the Deaf and Dumb and the Blind. Neither the Texas nor the Wyoming school was in operation during the year. In Pennsylvania a number of gentlemen of Pittsburg, in order to render available a legacy of \$20,000, have set about raising additional funds for the establishment of a western Pennsylvania school, but the Office is uninformed as to the result of their exertions. In Kentucky the department created in 1834 for the education of the blind colored children of the State was opened October 4, 1886. At Roxbury, Boston, a brick building large enough to accommodate 35 or 40 pupils is in process of construction on a recently purchased lot of 6 acres, and will be opened during 1887 as the kindergarten department of the Perkins institution. Three lots and a commodious building have been secured for the Oregon school.

The Perkins institution continues to be the New England school for the blind; New Jersey and Delaware still send their blind to the Pennsylvania institution, nine and three, respectively, and the District of Columbia has pupils at the Maryland school.

Higher education.—The effort to secure a college for the blind continues unabated, and at the last biennial meeting of the instructors a committee of thirty-three was appointed to carry on the agitation of the subject. It is proposed to ask Congress to incorporate an institution for the higher education of the blind, such as has already been established for the deaf (see p. 840, Convention). At the instance of Superintendent Anagnos the board of directors of the Perkins institution has taken steps in the organization of a post-graduate course in that institution, for those who have shown marked talent and capacity for higher attainment in any important branch of study or art.

Printing for the blind.—The radical difference of opinion as to the relative merits of the "line" and the point systems of printing for the blind still continues (see p. 840, Convention), and, to accommodate the friends of each system, the annual income from the national fund is expended in equal parts in producing the same work in different type. As between the point systems of printing and writing known as the Braille and the New York, the latter bids fair to become the American system, although it has not been so generally favored here as the Braille has been in England and on the Continent. Editions of seven works—"Pilgrims Progress," "Imitation of Christ," "In His Name," etc.—have been printed and distributed within the last few years by the Society for Providing Evangelical Religious Literature for the Blind, which also publishes a Sunday-school paper having a circulation of 1,000; and the American Bible Society has published during the year an edition of the Psalms in New York point. All these have been printed by the American Printing House, at Louisville, Ky., the great printing centre for the blind. At the printing office of the Perkins institution, which has recently been supplied with a new press, Scott's *Talisman*, in two volumes, the New Testament, in three, and two volumes of an edition of Dickens's *David Copperfield* have been printed in raised type.

Workshops for the blind.—Self-support in after life being the purpose for which manual instruction is given to blind pupils, the result is a matter of great interest to their instructors. If, after the time and money devoted to mental and industrial instruction, the great majority of the pupils become severally an educated rather than an illiterate burden on individuals or the community, merely from failure to make the vocations they have learned profitable, or from inability to obtain employment, it would seem doubly economical to drop the manual feature if, on examination, the cause of the evil be found irremediable. Touching this, Superintendent Chapin of the Pennsylvania institution, who has been familiar with the subject for the last 40 years, says: "In due time these young and elderly mechanics [pupils taught at his institution], having perfected their trades, are honorably discharged, some to their own homes, others to seek their fortunes in our larger towns. They apply for employment at the large manufactories and dealers, but are disappointed. There is not an establishment that will receive a blind man for employment. With the exception of those who succeed at their own homes in the country districts, there is very little hope for employment elsewhere for blind mechanics." Very much the same condition of affairs exists in England, on the competent authority of Dr. Armitage,¹ and did exist in Saxony and other parts of Germany until the "Saxon system" was introduced. This system consists in the institution's keeping up a permanent connection with its former pupils. For this purpose there is an annual fund of about \$7,500 derived from

¹The Education and Employment of the Blind, by T. R. Armitage, M. D., 2nd ed., 1886, pp. 71 seq.

invested funds, subscriptions, and the sale of work done by the pupils in the institution. When the pupil leaves the school, the director goes to his intended place of residence and secures the promise of a clergyman, the mayor, or some manufacturer to recommend and advise the future citizen, and to keep the director informed about him. When a pupil leaves, his outfit consists of a bed, clothing, tools, and material for his trade; all of which have been paid for out of his savings. Raw material is sent at wholesale prices on demand.

Differences of national institutions and the large extent of territory militate against the adoption of this system here, and the result is being accomplished in another way. In the workshop, or working home, for the blind provision is made not only for former pupils of institutions who can not support themselves, but also for the large number of those who, losing their sight after maturity, seek to learn some handicraft by which they can support themselves. Of this class of institutions the Pennsylvania Working Home for Blind Men was the first. In 1875, the year of its opening, 13,900 brooms were made by its six inmates, and the sales amounted to \$4,600; for the year 1886 the 105 inmates made 373,294 brooms, and the sales were \$60,827.11. The inmates are charged \$2.50 a week for board, which is deducted from their earnings, which in all amounted to \$15,638 during 1886. The State appropriates \$16,000 for maintenance and the city \$1,000, while legacies and donations swell the total for 1886 to \$17,000. In 1885, when there were 123 blind persons connected with the institution, of whom 24 were unskilled persons admitted during the year, the average loss for each was \$33.80. Dr. Armitage computes the average amount given by the Dresden, Saxony, institution at \$25.

Convention.—The American Association of Instructors of the Blind held its ninth biennial meeting at the New York Institution for the Blind, New York City, July 6 to 8, 1886, with an attendance of 43 delegates representing 24 institutions.¹ Mr. Wait, superintendent of the New York institution, in welcoming the association briefly reviewed its life. The first convention, at which fourteen out of sixteen schools were represented, was held in 1853, the next, the first of the current series, in 1871, since which the association has met regularly at biennial intervals. Mr. J. F. McElroy, in his paper on "Building for the Blind," advocated the subordination of architectural beauty to the requirements of the use the building is to be put to. As the noise of piano tuning and practice "is one of the most persistent nuisances," the isolation of such sounds becomes highly desirable. In the Michigan school the eighteen rooms for piano practice occupy wings and are on the sides most remote from the large open court in the rear of the main building and from its centre. The corridors of these wings are shut off from the main corridors by doors and heavy brick walls. The floors are concreted over a false flooring, upon which is laid a covering of ash, terminating at the partitions of the room, in order to prevent vibration. The partitions are double and are filled with "mineral wool," a hair-like mass of silica, which is almost impervious to sound and vermin. Mr. McElroy predicts the gradual downfall of the "old congregate dormitory system," "the indiscriminate herding of pupils into one room," through the provision for comfortable private rooms for pupils, and he urges such provision as tending to remove the reproach that institutional life tends to educate the children out of sympathy with their homes. Another point of construction specially relating to the blind (it is only such that space will permit here) is the important one of separating the sexes. If the sexes are completely separated, the building must be constructed to prevent communication; if they are to meet during recitation, such rooms must be centrally located and approaches must be arranged to prevent intermingling in coming and going. In the discussion that ensued Mr. Clement said he would supplant the congregate with the cottage system, a set of cottages for each sex.

Doctor Agnagos in his paper on "Workshops for the Blind," after speaking of the splendid achievements of the institutions for the blind, continued thus: "With all this success and progress, however, there is a proportion of blind adults, who can not maintain themselves by their unassisted labor. What shall be done with these classes? * * * Of the various measures which are proposed * * * the establishment of special asylums or workshops for both sexes seems to be recommended on all sides." But Dr. Agnagos would not have men and women herded together as in an asylum; he would give them an opportunity to support themselves in commodious and well-equipped workshops; he would pay them in cash and leave them "to the wholesome responsibility of taking care of themselves." These industrial auxiliary institutions should be located in large cities where a ready market obtains, they should be non-political and non-sectarian, should offer high salaries to officers, should encourage the blind workman to remain at home by transacting his business for him, and finally should have a permanent fund, the interest of which should be devoted to eking out the earnings of those who can not support themselves by their labor. Two cardinal principles must never be departed from in endeavoring to ameliorate the condition of the

¹ Proceedings of the Ninth Biennial Meeting of the American Association of Instructors of the Blind, 8°, 107 pp., Fort Plain, N. Y., 1887.

blind: they must be dispersed in general society and subjected to the ordinary influences of life; and the sexes should be strictly and absolutely separated. Mr. Chapin's paper dealt with the difficulty of the blind workman in procuring employment (see p. 838, Workshops for the Blind) and the hygienic necessity of work to him. He advocated an industrial establishment for the blind on the model, with a few modifications, of the Pennsylvania Working Home for Blind Men (see p. 839). This paper was followed by one from Mr. Hall, superintendent of the home just referred to, descriptive of the character of that institution. Mr. Huntoon thought the question of providing for the adult blind not germane to the education of youth, while Mr. Wait considered it as quite legitimate by reason of its being a legacy that had come down with the other principles borrowed or inaugurated by the pioneers in the work of educating the American blind. "Every Institution," says the resolution of the First Convention, "should afford employment to all its graduates of good moral character." The experience of his own institution proved this to be impracticable, and the necessity must be met by the incorporation of private associations for the purpose of furnishing employment to the blind workman, and of intruding their care into his private affairs only so far as his inability to care for himself demands. Statistics show that in 1879, of 307 blind persons in the almshouses of the State of New York, 88 per cent. had lost their sight after their twentieth year, and that 87 per cent. had pursued some useful or skilled occupation before losing their sight; of the 1,200 persons who had been instructed at the New York institutions only 21 were in the almshouse at the above date. At the close of the discussion Mr. Battles introduced the following:

"Whereas, deaf-mutes and the blind require entirely different methods of education, and whereas a number of States co-educate these two defective classes,

"Resolved, This association disapproves such co-education."

The resolution was unanimously adopted. The session was then closed by Mr. Battles's paper on "The Powers, Duties, and Responsibilities of the Superintendent," and a vote of confidence in the Society for Providing Evangelical Literature for the Blind.

Mr. Huntoon, in his paper entitled "The General Character of the Embossed Literature which the Schools for the Blind Demand," had the purpose "briefly to summarize what the [American] Printing House has already done," and to protest against the purchase of apparatus with a part of the income from the Congressional fund for printing embossed books. Speaking of the point system, Mr. Huntoon remarked: "The points have come to stay, and they have come to dominate." Mr. Hall acknowledged that he had been converted to the New York point system. Mr. Dow trusted that it would soon become the system universally used. Mr. Battles said that the boys of the Pennsylvania institution averaged in reading only twenty-eight words a minute, while in the New York institution (Mr. Wait's, the author of the New York point system) the average was about sixty-three, although, so he stated, the comparison between the schools was hardly fair as a test of the relative merits of the systems on account of the conditions under which the trial was made at Philadelphia. Mr. Wait thought that the sentiment of the profession is uniting, and the sooner it is decided that the funds of the American Printing House shall be expended upon books of one character of type the greater will be the supply of literature for the blind. Mr. Babcock considered the point as greatly superior to the line in tangible power, and that the one system should be the New York point. Mr. Harvey said he would be glad to know that all the books from the American Printing House were to be in point printing, which, on the principle of the greatest good to the greatest number, should be adopted. On the other side, Mr. Graves maintained that children complained to him that they could not read the point as long as they could the line, because their "sense of touch becomes weak," and Mr. Wood did not think that the test referred to by Mr. Battles was at all final.

Mr. Wait, in his address on the important question of "A College for the Blind," said that as the kindergarten and the university were the educational extremes, as the blind had shown their ability to follow with advantage the higher studies—witness Saunderson, mathematician and successor of Newton at Cambridge; Foster, professor at the same university and postmaster-general; Nelson, of New York, professor of languages; and Carll, blind graduate of Columbia College, New York, and author of the "Calculus of Variations"—and as blindness is a bar to those vocations to the practice of which light and sight are indispensable, and as our public policy recognizes higher education as being the right of all who are competent to receive it, "is it too much to ask that those who must work in darkness shall be given special facilities for enlarging the contracted sphere of their opportunities and for preparing them to do their work well?" To those who would have the blind enter the colleges for the seeing, Mr. Wait responds by saying that experience has shown it is impracticable; the difficulties that Mr. Carll surmounted, aided by the most favoring surroundings, outside of the class room, would prove fatal to the progress of the majority. During the last day of the session (July 8) it was resolved by the association: "(1) That in the judgment of this association, an institution for the higher education of the blind has become a

pressing necessity for the intellectual, professional, and moral advancement of the blind of this country; (2) that this association warmly endorses the efforts of those earnest friends of the blind, who have, by unwearied endeavor, sought to establish such an institution; (3) that a committee of nine¹ be appointed from this association to take up and carry forward this work on behalf of the association, said committee to be appointed by the chair." After the passage of the resolutions, papers were read by Mrs. Little on "Methods of Teaching," and Mr. Dow on "The Idiosyncracies of the Blind." Mrs. Little spoke of the great difficulties under which the congenital or practically congenital blind pupil labored in acquiring ideas, and of the assistance they derived from the objective methods of the kindergarten, and advocated the employment of tangible apparatus in the higher grades. The study of geometry is especially valuable, as it affords the blind pupil the best means "of acquiring the power of forming a correct conception from a verbal description."

Meeting of the board of trustees of the American Printing House for the Blind.—This body, composed of the superintendents of the institutions for the blind, held its annual meeting July 7, 1886, at the New York institution, New York City. After some discussion, Mr. Graves, of the Alabama institution, who presented a proxy from Mr. Johnson, principal of that institution, was admitted as a trustee by a vote of 10 to 7. Mr. Dow then introduced the following resolution: "That requisitions by any institution for the blind upon the American Printing House for the Blind, for books or tangible apparatus, printed or constructed elsewhere than at the American Printing House for the Blind, shall be duly honored, provided that such requisitions do not exceed 20 per cent. of the income from the subsidy fund of the Institution making such requisition." An amendment to strike out 20 and insert 25 per cent. was lost by a vote of 10 to 8. The original question then coming up, Mr. Huntoon opposed the resolution, as it "would cripple materially the resources and the business affairs of the American Printing House." After an extended debate the resolution was passed by a vote of 14 to 5.²

II.—NOTES FROM CATALOGUES AND REPORTS OF INSTITUTIONS.

ALABAMA.

Alabama Academy for the Blind, Talladega, Ala.—Although this school entered upon its life as a separate institution in February, 1887, the source from which the following facts are taken covers a period previous to that event. In the literary department the course is continued above the common school studies, and in the department of music instruction is given on the piano, organ, violin, etc., and in the theory of music and in harmony. The print used is the Braille, New York point, and pin-type. Although the boys are employed in manufacturing mats, mattresses, etc., the object of the school is to prepare as many of its students as possible as instructors in literature and music. In order to secure competency the senior pupils are required to teach several hours every week.

ARKANSAS.

Arkansas School for the Blind, Little Rock, Ark.—This school opened in 1860 with 10 pupils in attendance. In 1870 the attendance was 38, in 1880, 32, and in 1886, 63. The "frail, dangerous, and unsightly wooden shells" formerly used as school rooms and dormitories have been demolished, and a handsome and commodious structure of brick erected, lighted by gas and heated by steam, capable of accommodating 120 children, and permitting a complete separation of the sexes. An annual appropriation of \$500 is asked to enable the superintendent to supply worthy indigent pupils with the tools necessary to the successful prosecution of the trade they have learned in the school. After the kindergarten, the benefits of which are marked, the school is classified in 4 grades, each of 2 divisions; in the highest grade the course is academic. In the music department 37 pupils have received instruction on the piano, 11 on the organ, and 8 on other instruments, while 10 have been taught thorough-bass and harmony, and 6 tuning. In the industrial department shoe and brush making have been added to broom and mattress making, and it is expected soon to add willow work.

¹ Subsequently increased to 33.

² The local board of trustees of the American Printing House for the Blind having asked an opinion from the Secretary of the Treasury of the United States as to the legality of this resolution, the First Comptroller of the Treasury, under date of March 12, 1887, responded as follows: "It is my opinion that the act authorizes the trustees to use the fund set apart by the act for the purchase of the supplies mentioned through the American Printing House for the Blind, at Louisville, Ky., alone; that said trustees are not authorized by the act to make such purchase from other sources, as it appears * * * a majority of the trustees think they have a right to do, and that such a diversion of the fund would be unlawful." The fund here referred to is that established by Congress.

COLORADO.

Colorado Mute and Blind Institute, Colorado Springs, Colo.—Of the 23 blind children that have entered the institution, only one was born blind. The line and the point print are used, and vocal and instrumental music are taught to those competent to derive benefit from the instruction. Very little manual training is attempted in the blind department as yet. An appropriation of \$500 is asked for the purchase of the necessary machinery to introduce broom-making and carpet-weaving.

ILLINOIS.

Illinois Institution for the Education of the Blind, Jacksonville, Ill.—During the 2 years covered by the report, great effort has been made to find the blind persons in the State that were not in the institution though entitled to enjoy the benefits that it offers. Although 7,000 letters were sent to persons most likely to furnish the information, the correspondence did not result in increasing the attendance, forcing the trustees to the conclusion that all are in the school that are entitled to its privileges, or that non-attendants are not to be discovered in their retreats. In the literary department the course carries the pupil through and beyond the common school studies; in the musical department piano-tuning is taught to those capable of profiting by the instruction; and in the industrial section broom-making, cane-seating, and mattress-making are taught.

INDIANA.

Indiana Institution for the Education of the Blind, Indianapolis, Ind.—Of the 130 pupils in this school, October 31, 1886, 32 per cent. were born with their infirmity. Sixty per cent. were not totally devoid of sight, the cases shading down from those unable to distinguish form to those only and barely able to distinguish light from darkness. The object of the literary department, consisting of 6 grades, is to give the pupil a sound English education; all are instructed in music, and special instruction is given to those showing talent; 12 pupils receive instruction on the cabinet or pipe organ, 69 on the piano-forte, and 18 are individually instructed in voice culture. To prepare students intending to become music teachers, "normal teaching exercises" are given, in order that they may anticipate and rectify any deficiency that might interfere with the practice of their future vocation. Piano-tuning receives the attention its importance demands and the inadequate facilities will admit of. Broom-making and cane-seating are the only industries that the blind workman can rely on, and are taught from 1 to 3 hours daily.

IOWA.

College for the Blind, Vinton, Iowa.—This institution was established that the citizens of the State might have for their blind children advantages similar to those offered by the public schools. In view of this, the difference between this school and the public schools has been reduced as much as possible, the course of study covering twelve years—four primary, four grammar, and four academic. The system of government is dual. A principal has charge of the pupils, the educational apparatus, and the building and its domestics, while a secretary has charge of the property and employes outside of the college building, and of the buying and selling. "This system," says the principal, "is eminently satisfactory to the secretary and myself."

KENTUCKY.

Kentucky Institution for the Blind, Louisville, Ky.—Earnest efforts have been made during the year to acquaint parents with the character of the school, and not without results. The pupils are required to exercise daily in light gymnastics. On entering they become members of the kindergarten, where the sense of form and touch are educated.

MASSACHUSETTS.

Perkins Institute for the Blind, Boston, Mass.—The family system of this institution has prevented the evil effects of crowded quarters, but the institution has reached the limit of its capacity, and has been compelled to refuse several eligible applicants. In the literary department the pupils are divided into small classes and receive a certain amount of individual instruction in a simple and natural way. The course in natural science consists of zoölogy, followed by botany and physiology. Throughout this course the teacher's explanations are supplemented by models, and clay is largely used to enable the pupil to form his ideas correctly. "We know that

a girl understands the articulation of the skull and the vertebral column when she can take a bit of clay and show it." In the music department 88 pupils received instruction on the piano, 10 on the organ, 6 on the violin, and 27 on brass or reed instruments; 25 received individual instruction in vocal music, and 38, divided into 7 classes, studied harmony. A full and systematic course of training is given in the tuning section, which is splendidly equipped for the study of musical acoustics and for the development of mechanical proficiency, the pupil receiving instruction in the theory of scales, harmonies, beats, and temperaments, and then, by the use of models and the dissection of instruments, in the construction of the piano and its repair. The trades taught at the institution are cane-seating, broom and mattress making, and upholstering furniture.

MISSOURI.

Missouri School for the Blind, St. Louis, Mo.—The principal events in this institution for the biennial period, 1884–86 are a radical change in its discipline, subjecting its inmates to rules of conduct that are consistent with its character as a public school, and the addition of a kindergarten. The talent of the pupils in the musical department was not such as to produce high results, but there is every reason to believe that the high standard of years past will soon be reached. The superintendent is inclined to think that the industrial rather than the music department is that from which the most benefit is derived, since for every one of the many good musicians instructed by the school ten workmen have been turned out capable of making salable brooms and brushes. Superintendent Sibley suggests as good policy that 10 acres be purchased in the suburbs of Saint Louis, and that a new institution be built on the cottage plan.

NEW YORK.

New York State Institution for the Blind, Batavia, N. Y.—Of the 163 blind children in the institution during the year 11 per cent. were born so, the other cases resulting mostly from inflammation or accident. The literary department, in which both the line and point are used, consists of five grades, of which the last two are academic; kindergarten instruction is also given. In the department of music, 11 pupils received instruction on the organ and 88 on the piano; 23 were taught harmony and almost all were in the singing classes. In the industrial department 18 pupils were taught broom-making, 5 of whom acquired the trade and left the school, 12 were taught mattress-making, and 24 cane-seating. Three of the 27 scholars instructed in tuning left the institution to engage in business.

NORTH CAROLINA.

North Carolina Institution for the Deaf and Dumb and the Blind, Raleigh, N. C.—The literary division of the blind department has a curriculum in which studies of an academic grade are included. Although the liberality of Congress has well supplied the school with books, it lacks the apparatus and appliances that are essential to the instruction of the blind. A kindergarten and a gymnasium are also required. In the department of music instruction is given, mainly to prepare for teaching, in vocal culture and harmony, and on the piano and organ. In the industrial division, in which are 11 boys, cane-seating, broom and mattress making are taught for 2 hours daily.

PENNSYLVANIA.

Pennsylvania Institution for the Instruction of the Blind, Philadelphia, Pa.—In the literary department there are 88 classes for males and 67 for females, an average of 5.6 pupils in each; in the music and work departments the teaching is, in general, individual. A large majority of the students are pursuing the common school studies, some 14 or 15 studying algebra, astronomy, and political economy, and 22 literature; 34 are in the kindergarten. In the music department 67 are receiving instruction on the piano, 15 on the organ, 26 on the violin, and 74 in the theory of music, and 22 in piano-tuning. In the vocal classes there are 105 pupils. It is in these classes, says the superintendent, that a foundation for that further education by the music department is given that has enabled its pupils and graduates to obtain positions again and again, though competing with seeing persons. The tuning department continues to receive the attention that its importance demands. In the industrial department broom and mattress making and cane-seating are pursued. The Legislature has been asked to leave the duration of the pupils' residence to the discretion of the board of trustees.

TEXAS.

Texas Institution for the Blind, Austin, Tex.—Increased facilities are needed in each of the three departments of the school, caused by the increase of its students. The children are prepared in the kindergarten for the regular course which consists of the usual common school studies, English literature, and elementary science; both the line and point print are used. Nearly all the pupils are given an opportunity to study music, but failure to make progress after a fair trial is deemed sufficient proof that further exertions would be useless; the number regularly receiving musical instruction rarely exceeds one-half the enrolment. Broom-making is a satisfactory business in Texas, but brush-making, carpet-weaving, and upholstering are unprofitable. To stimulate and encourage the boys to overcome the natural propensity of the blind to sedentary habits and consequent indisposition to work, the superintendent has introduced a system of remunerating the pupil-worker, the pay he receives being about the same as would have been given him in a broom factory.

c Georgia and Maryland.

d Represented here by Oregon.

Of the 3 institutions established since 1883, not including the dual institutions recently established in Wyoming and Texas, two are dual, a form that several times has been publicly objected to by the convention of American Instructors of the Blind (see p. 840, Convention), but which is especially necessary, perhaps, in thinly settled countries. The Alabama Academy, appearing here for the first time, was formerly the blind department of an institution of this dual class. No comparisons have been instituted or percentages obtained in which the number of "instructors and other employes" would have been a factor. In several cases the answer given in the return has been the number of teachers, and the fact stated, while in other cases it is probable that the same thing has been done without indicating it. In the future the inquiry will be "number of instructors." With the exception of the school for colored blind and deaf persons of Maryland and the department for the blind of the North Carolina school, it has been found impossible to separate the financial affairs of the dual institutions, and reference is made to the table for the deaf where receipts and expenditures, etc., are given for the whole institution. To prevent a fictitious increase or the reverse in receipts the Office has, in the tables by States arranged by divisions, assumed the appropriation to have been the total amount received. In computing the per capita expenditure and valuation of Table 80, the number of the pupils in attendance at institutions whose expenditure or property valuation is not given has not been included in the division when computing the percentage.

b Teachers.

III.—EDUCATION OF THE FEEBLE-MINDED.

I.—GENERAL REMARKS.

New institutions.—The act of March 5, 1885, establishing an institution for feeble-minded youth in Nebraska recites that, "Besides shelter and protection the prime object of the said institution shall be to provide special means of improvement for that unfortunate portion of the community who were born or by disease have become imbecile or feeble-minded, and by a well adapted course of instruction reclaim them from their helpless condition, and through the development of their intellectual faculties fit them as far as possible for usefulness in society. To this end there shall be furnished them such agricultural and mechanical education as they may be capable of receiving." By the provisions of the act the institution was to be located near Beatrice, on the condition that not less than 40 acres of land were to be conveyed to the State by that city. Fifty thousand dollars were appropriated to construct buildings, and an annual tax authorized, not to exceed one-eighth of a mill, to support the institution. Children of indigent parents have transportation furnished them and are clothed; the age limitation is 5 to 18. The institution was opened on May 25, 1887, but will really begin its work in September next.

The institution heretofore known as the Indiana Soldiers' Orphans' Home and Asylum for Feeble-Minded Children is reported this year as the Indiana School for Feeble-Minded Youth. The immediate cause of separation appears to have been the destruction by fire of the main building of the dual institution, necessitating the removal of the orphanage to temporary quarters in Knightstown, while the feeble-minded children were accommodated in a 4-room school-house on the grounds of the institution near that place, from which they were removed to Richmond, Ind., on May 17, 1887, to await the completion of a building for them at Fort Wayne. In June, 1886, an institution was established by Dr. Samuel J. Fort, its principal, at Ellicott City, Md., and is strictly a private school, having as yet had no assistance from outside sources.

Convention.—The tenth annual session of the Association of Medical Officers of American Institutions for Idiotic and Feeble-Minded Persons convened at Syracuse, N. Y., September 29, 1886,¹ and continued in session 3 days. Of the several resolutions adopted the following is of importance in an educational sense in view of the legislative action that has been taken regarding its subject matter as a public school study:

"Whereas, the members of this association are convinced from their observation and the records of their institutions that a large percentage of idiocy and feeble-mindedness is due to the transmitted effect of alcohol: Therefore,

"Resolved, That it is their conviction that, together with the educational training of the young in the avoidance of the evils of intemperance, there should be some legal repression upon the indiscriminate sale of intoxicating beverages."

In his inaugural address Dr. Powell, of the Iowa Institution, after briefly tracing the progress of the establishment of institutions for the imbecile, urged their necessity and the amplification of their scope. At his own institution (as in several others) a division into two departments—educational and asylum—obtains, and the utter helplessness of the inmates of the latter makes it the duty of superintendents to ask separate provision for them adapted to their low grade of intelligence. For the "large number" who have not adequate ability to cope with the world, the institution should be a "life-school for its inmates, thereby preventing the transmission of infirmities to a still more degraded progeny;" and the step taken in establishing the custodial institution at Newark, N. Y. (see page 852), is being followed at the Pennsylvania institution, while the visiting committee of the Iowa institution recommend that the care of the State institution be made perpetual. The necessity for this custody of certain adult imbeciles was developed at length by Mrs. C. W. Brown, of Barre, Mass., in a paper entitled "The Future of the Educated Imbecile," in which the essayist stated that "although the feeble body may be invigorated and the useless hand trained, enabling the feeble-minded man or woman to become self-supporting, no means have yet been found to strengthen the will or develop morality in the great majority." Dr. George Brown, of the Barre, Mass., institution, in his paper entitled "The Principles of our Work," would answer the question, "What is the real essence of our teaching the defective minds committed to us?" by saying that "It is to form habits—habits that by their repetition shall become instincts; * * * and these habits shall be the basis of memory." The hope should not be held out to the public that training and teaching are in general likely to overcome radical defects of nerve organization, but what has been accomplished for such unfortunates should be

¹ Proceedings of the Association of Medical Officers of American Institutions for Idiotic and Feeble-Minded Persons. 8^o, pp. 89. Philadelphia, 1887. Dr. I. N. Kerlin, Elwyn, Pa., is the secretary of the association.

most confidently shown as evidences of the improvement that may be attained under the fostering care of institutions for imbeciles. In his paper "On a Broader Provision for Epileptics," Dr. G. H. Knight, of the Connecticut institution, thought that more attention should be given to this class, the teaching of which is the slowest and most discouraging work in an institution for imbeciles. In the 6 institutions that have made a beginning in this work 202 epileptics had been, at the time of reporting, under special treatment, 53 per cent. of whom had been improved; while 4 institutions together report 8.5 per cent. cured. As the other papers were of a pathological or personal nature, their contents would be inappropriate here.

II.—NOTES FROM CATALOGUES AND REPORTS OF INSTITUTIONS.

CALIFORNIA.

California Home for the Care and Training of Feeble-Minded Children, Santa Clara, Cal.—With \$32,400 of the \$45,000 appropriated to establish this school, a farm of 51 acres was purchased, an old building on the place renovated, and new ones built. These buildings were occupied in 1885. The accommodations, however, are already so inadequate that applications for admission are refused, and an appropriation of \$150,000 for additional buildings believed to be necessary.

INDIANA.

Indiana School for Feeble-Minded Children, now at Richmond, Ind.—The work of the school has been much interfered with by the destruction of the main building, making it necessary to send a number of children home; the others were accommodated in a school building of 4 rooms, formerly used by the orphanage. The school-work consists of articulation, spelling, reading, writing, arithmetic, and geography; the occupations are house work for the girls, and farm and garden work for the boys.

KENTUCKY.

Kentucky Institution for the Education and Training of Feeble-Minded Children, Frankfort, Ky.—The pupils are instructed in the common school studies; in the industrial department the boys are taught carpentry and shoe-making. Of the 4 boys returned to their homes, 2 had made sufficient advancement to sustain themselves, 2 were unimprovable; of the 6 girls, 4 had so improved that their friends were glad to receive them, 1 was placed with a respectable family, and the other dismissed as suffering with a contagious disease. The industrial feature of this school, which is quite marked, is more fully referred to under Manual Training (page 789, *Industrial Training in Schools for the Feeble-Minded*).

MARYLAND.

The Font Hill Private Institution for Feeble-Minded Children, near Ellicott City, Md.—This institution, established during the summer of 1836, is situated on a farm of 90 acres, contains twenty large and well ventilated rooms, and is lighted with gas. Dr. Fort, its superintendent, and his wife were formerly instructors in the Pennsylvania Institution for the Feeble-Minded. The object of the school is to furnish a private home for feeble-minded persons requiring special care, and to train those of a higher grade of intelligence. Kindergarten exercises are much used in school work, and, where practicable, the simpler studies of the common school are introduced.

MASSACHUSETTS.

Private Institution for the Education of Feeble-Minded Youth, Barre, Mass.—The purpose of the institution—the education of children not amenable to ordinary modes of instruction—is individual in its character, and is carried somewhat beyond the common school course by the addition of geometry, physics, and German.

MICHIGAN.

Wilbur Home and School for the Feeble-Minded, Kalamazoo, Mich.—To afford an opportunity to parents desirous of having their afflicted children educated in a private establishment, Dr. Wilbur has established this institution, with accommodations for 30 pupils. The small number cared for permits great attention to individuals, and prevents the possible evils of the contact of a pupil with others more unfortunate than himself.

NEBRASKA.

Nebraska Institution for Feeble-Minded Youth, Beatrice, Nebr.—By a series of inquiries the superintendent of this recently established institution has obtained the names of 614 idiotic and imbecile persons in the State, the age of 19 of whom was not ascertained. Fifty-two per cent. of those whose age was obtained were between 5 and 18, and 2.5 per cent. under 5. The superintendent recommends that the introduction of manual training be deferred until the school-room work has been well established.

NEW YORK.

New York State Custodial Asylum for Feeble-Minded Women, Newark, N. Y.—To obviate the evils of the promiscuous association of young women of unsound mind with the male inmates of the county poor-houses of New York, this institution was established in 1878, as a place of custody rather than of education. The teachable inmates, however, are taught to sew, read, write, and do general house-work.

New York State Asylum for Idiots, Syracuse, N. Y.—Of the 203 applications for admission since September 30, 1884, 53 per cent., excluding the cases of whom no record was obtained, were of a parentage untainted by insanity, intemperance, or disease, and in 17 per cent. the father, or mother, or both, were said to be imbecille, epileptic, or insane. There were 5 cases having a consanguineous parentage. In the school there are two grades; the higher is instructed in reading, writing, and numbers; the lower kept occupied with peg-board, dotted pin-cushion, etc. Inmates of sufficient mental and physical capacity are put to work during a portion of the day at some occupation suited to their capacity.

OHIO.

Ohio Institution for Feeble-Minded Youth, Columbus, Ohio.—In the language of the superintendent: "The training of the school-rooms is simply a means to the more important end of developing the industrial power of the children. This has shown convincing practical results in the industrial departments here." The work of the industrial department has been greatly retarded on account of insufficient accommodations caused by the pressure for admittance.

PENNSYLVANIA.

Pennsylvania Training School for Feeble-Minded Children, Elwyn, Pa.—At the date of the report 590 children were lodged in the two separate ranges of buildings of the institution; the first, containing 333 girls and boys, known as the educational and industrial departments; the second, a third of a mile away and containing 252 children, as the department of the asylum, or Hillside Home. One hundred and ninety-two children were enrolled in 8 "day-schools," in which a special class of articulation was formed. In the shoe and mattress shops, the bakery, and the laundry, a number of the more advanced inmates are occupied, many of them supporting themselves, but the greater number of the inmates are employed in agricultural and domestic service. The uniformly unsatisfactory results of placing young women in private homes has induced the superintendent to refuse to permit further trial of this system. A new carpenter-shop and a cottage for young women of slightly-impaired intellect are building. Superintendent Kerlin urges the desirability of separate provision for cases denominated as paralytic, epileptic, or moral imbeciles or idiots.

III.—STATISTICS.

a Pupils of institutions not reporting expenditure excluded in making the computations contained in the column.

b One institution.

c The disproportionately large per capita here (\$751) results from including the cost of site and erecting buildings, etc., of the California school.

d Omitting the pupils of the California institution, as well as those in institutions not reporting expenditure.

Of the 5 schools established since the Report of 1882-83, those founded severally in the States of Massachusetts, Maryland, and Michigan are private, while the schools in Nebraska and California, respectively, are State institutions. The seeming inconsistency of refusing to make computations in which the number of the "teachers and other employés" is a factor, in the case of the blind, and yet making that very computation here, is to be explained thus, quoting the language of the superintendent of the Ohio Institution in the thirtieth annual report of that school: "They [the pupils of the year] came to this Institution as to a school possessing means for their training and development not attainable elsewhere. It is therefore an *asylum* and *hospital*, as well as a temporary home and school." It would seem, therefore, difficult to distinguish in such an institution between the functions of the teacher and those of the physician or nurse, both characters perhaps being united in the same person; to avoid the possible inclusion of domestics,—cooks, chamber-maids, gardeners, and the like,—who have nothing to do with the personal care of the children, the query hereafter will be "teachers and assistants."

a Appropriation for 1885 and 1886 to purchase site, erect building, and support institution; the appropriation was exceeded by \$0,835.

b Owing to the late date at which these statistics were received they have not been included in the preceding tables.

IV.—REFORM SCHOOLS.

I.—GENERAL REMARKS.

New institution.—The only new institution for the year under review that the Office has record of is the Burnham Industrial Farm, Canaan Four Corners, N. Y., an institution founded on the theory in practice at the celebrated Raubes Haus, at Hamburg, and the agricultural modification of it that exists at Mettray, near Tours. Its object is to receive bad but corrigible boys, to awaken in them a desire for respectability, to provide situations for them where industry will be rewarded, and, finally, to guard them from relapsing into old courses. This school is established on advanced lines. It is in the country, surrounded by a splendid farm, has the cottage system of construction, the family system of government, and an unobjectionable name; and to these high and generally recognized advantages the authorities would add freedom from the vexations arising from depending on public funds and from "questions of political control and religious interference, that have perplexed the several institutions that have been founded more or less upon these [its] ideas."

Classification of pupils.—One of the most important elements, if not the most important, in reformatory education, is the removal of the offender from the influence of criminal associates. If all the youths detained were equally bad, or if the shades of their criminality varied within narrow limits, there would be little danger of contamination in congregating them. Experience and statistics testify that no such equality exists. In a paper read before the National Prison Association, Superintendent Gower, of the Reform School at Lansing, Mich., says: "A great majority of boys who come under our care are not by nature bad. * * * They have been deprived of those influences which a good home supplies. * * * Could they have been placed in good homes at the time they are sent to us, most of them would have been saved to society without the intervention of the institution." The reformatory at Lansing is conducted on the open system, but Superintendent Caldwell, of the House of Refuge, Louisville, Ky., an advocate of the enclosed plan, speaks to the same effect: "It seems to me a fair estimate to include in these two classes [those detained, who require care rather than reformation, and 'the small proportion of physical, moral, and intellectual imbeciles'] 75 per cent. of reform-school children."¹ Turning now to the domain of statistics which the interesting and valuable table of the New York House of Refuge permits, it appears that for the decade ending September 30, 1886, 48 per cent. of the whole number of commitments to it were for crime, the other 52 per cent. for vagrancy, disorderly conduct, and the like. But it must not be supposed that the 48 per cent. were hardened criminals. In working the ratio the Office was compelled to include the number committed for petty larceny, though of such Superintendent Hite, of the Ohio institution, says: "It is a lamentable and notorious fact that guardians and even parents have had their children arrested * * * for the most trivial offences * * * . There are at the present time boys serving out long sentences for taking articles * * * valued at 25 cents, for jumping on a railroad train while in motion, taking a small amount of scrap-iron * * * and the commissions of other petty larcenies of similar insignificance." In Great Britain this distinction is made and met by the establishment of two classes of schools: reformatory schools for the better training of juvenile convicted offenders; industrial schools for vagrant and neglected children and children not convicted of theft. In the absence of such provision here the cottage system of construction is thought to be a substitute, as each cottage has its own play ground, and in many instances its own school and place of work; indeed, at the Ohio Industrial School 150 little boys under twelve are placed in a cottage half a mile from the 10 other buildings of the school, and never see the older boys except in marching to or from religious services on Sunday.

The cottage system.—This system of construction, entailing as it does the family system of government, seems to be very popular. We find the board of managers of the House of Refuge at Philadelphia urging the State Legislature to purchase and convert the buildings now occupied by the school into a reformatory for men, in order that an agricultural reform school on the family system may be established with the proceeds, each family to consist of 30 or 40, thus removing "the objectionable feature of the congregate system, where large numbers are confined within high walls and prison-like appliances." At the recently established Burnham Industrial Farm, pupils are placed "in cottages with not more than 15 or 20 under one roof, so that by separation into small families a close personal supervision may be maintained," and the management of the Lyman School for Boys felicitates itself upon the success of a recent change from the congregate to the cottage plan. As to the economy of small buildings the statement of the board of control of the State Industrial Home for Girls, Michigan, is pertinent: "We find the large building, erected as an experi-

¹ The Reform School Problem, in Proceedings of National Conference of Charities and Correction, 1886.

ment, * * * no more economical, much more difficult to manage properly, and less satisfactory in every way than the smaller ones," while the board of trustees of the Maine State Reform School, speaking of the system of cottages there, says that "it does cost more, but it is worth more."

There are various modifications of this system. In some instances each family has its own school and work, while in others there is a general dining-room, and family distinctions do not exist during work or school hours, so as not to interfere with grading; in others a spirit of emulation is evoked, and the family connection is a sign or distinction or the reverse. Perhaps no school on the cottage plan surpasses in wealth of land or buildings the Ohio school, which has a farm of over 1,000 acres, and nine cottages arranged in a semicircle around the main building, in addition to the distant cottage for little boys referred to above.

Results of reformatory training.—As so large a percentage of the inmates of reformatory institutions are not of the criminal class, it would be, quoting the language of Superintendent Caldwell in the address before referred to, "disingenuous * * * to claim credit for reformation in such cases." When it is said, therefore, that 80 per cent. or 90 per cent. of the pupils who leave an institution are doing well, it must be borne in mind that if all had become respectable members of society, from half to three-fourths of them had never seriously, if at all, attacked it. In such cases the institution can claim only that it had received and instructed them when surrounded by every circumstance tending to facilitate an entry on a criminal career. The source of the statistics that are not rough approximations as to the life the former pupil is leading, is the information derived from the reports of the agent of the institution. During the year 1886, 261 boys were discharged from the House of Refuge at Philadelphia, who with those still on the agent's list from previous years made a total of 328, of whom nearly 97 per cent. were located in Pennsylvania, New Jersey, and Delaware. To or about these, 775 letters were written and 723 visits made, and from the information thus obtained the agent estimates that 90 per cent. were doing well—a percentage confirmatory of the estimate of his predecessor. In New Jersey the agent visited 686 of the boys who had left the State institution, and grades them 21 per cent. doing "very well," 56 per cent. "well," 19 per cent. "not well," and 4 per cent. "badly." Besides these, the agent made 325 visits during the year, mainly to ascertain the character of the surroundings of the homes of the boys in the institution, or to have friends secure suitable employment for those ready to go out. It is a part of the duty of the assistant superintendent of the House of Refuge of Cincinnati to report monthly concerning the children paroled or released from that institution. From 1881 to 1886, 1,044 children had been paroled, of whom 240 had been recalled either from the unfitness of the place or pupil, 169 had been dropped on reaching majority, and 82 had been lost sight of or had died. Excluding these, 47 per cent. of the number sent out, in other words considering the 553 that remained out, 97 per cent. are doing well and 3 per cent. badly. In the Nebraska school, of 62 boys and girls who have honorably left the school 6 have been brought back and 2 have relapsed into criminal courses; the others, 87 per cent., have conducted themselves in a creditable manner. In a report asked for by the State Board of Charities and Corrections of Michigan, W. H. Faxon, a county agent of that State, says: "Within the past year I have secured homes for about 30 boys from the reform school at Lansing on leave of absence * * * ; the boys are all doing well." The former practice of visiting children indentured to persons in the neighborhood of New York City has been resumed by the New York House of Refuge, and the information from this source, and from corresponding frequently with masters, parents, and guardians, confirms the superintendent's estimate "that upwards of 80 per cent. of the children are reformed through the instrumentality of this [his] institution." Considering the subsequent career of nearly 2,000 persons who have gone through the course of the Indiana School for Boys, the superintendent says: "The most careful estimates show that nearly 90 per cent. have become good citizens; Of the other 10 per cent. some have done moderately well, and still others have done badly."

Reformatories for men.—Of the two systems of prison discipline that have originated in this country, that known to the French and English investigators sent here to report upon their respective merits as the Auburn or silent system, has, though modified beyond recognition, supplanted the Philadelphia or solitary confinement plan. In practically isolating the criminal, an expedient of Quaker origin, reflection and religious instruction were the reformatory agencies, a course occasionally resulting in madness or suicide, while on the Auburn plan, in its early days at least, no attempt was made at reformation, other than through the deterring effect of a hard life and a continued silence enforced by spontaneous lashing. Sunday instruction in writing was stopped, as it was found that it afforded the prisoners a very easy means of communicating. To these early and now decayed efforts at reform through reflection or intimidation, there has been added, during the last few years, reform by education, founded on the indefinite sentence, the love of liberty, the effects of mental effort, and a trade. There are two institutions in the United States conducted on these principles, though sev-

eral others are coming into existence. One, the State Reformatory at Elmira, N. Y., is entering upon its second decade, while the other, the Massachusetts Reformatory, Concord, Mass., has just completed its second year.

In his report for the year 1886 the superintendent of the Detroit House of Correction, which is not a reformatory institution, sums up the experience of 25 years of that institution in the following energetic and unmistakable language: "It must be evident that there is no marked success in the diminution of crime commensurate with the great improvement in the manner of keeping and caring for criminals. * * * This is clearly shown by the steady growth of an element in the community known as 'incorrigibles,' * * * in whom the practice of short sentences seems to act only as a good opportunity to recuperate energies wasted by debauchery."

The superintendent does not stop here; he gives the figures, and upon these the Office has based some computations. During the 25 years closing with 1886, 40,338 persons were sent to this prison, of whom 15 per cent. had been committed twice, 6 per cent. three times, 12 per cent. over three but under ten times, 3 per cent. ten to twenty times, and 1 per cent. twenty-one to fifty-seven times. After the forty-third commitment the number is only one or two for each step of the notation to fifty-seven. Sixteen per cent were under twenty, 23 per cent. twenty to twenty-five, 18 per cent. twenty-five to thirty; 71 per cent. could both read and write (their facility is not graded), while 6 per cent. said they had had no religious instruction.

If not to rectify, at least to improve, this condition of affairs, has been the mission of the Elmira Reformatory, which is charged with the custody of prisoners committed for the first time, mostly under the Indefinite Sentence Law of 1877, between the ages of 16 and 30. Here in a school of 3 sections closely corresponding to the primary, grammar, and high school divisions of the public schools, the prisoner is lectured to and catechised on political economy, American history, civil government, business ethics, English literature, and physiology in the highest division, numbering 268; is taught arithmetic, composition, and the history of the English language in the intermediate grade, numbering 210; and reading, writing, and arithmetic in the lowest grade, numbering 135. The school ceased to be an experiment after the introduction of history, civil government, and physics, though economics, English literature, and physics are the most successful and lasting studies. Graded instruction in drawing, carpentry, stone-cutting, etc., is given in the evening, while many are employed in commercial manufacture during the day. The inmates are marked according to their diligence in executing their school and other tasks, and according to their conduct. When they have acquired a certain standing they are considered fit to be trusted upon parole, and they are, after each case has been duly considered, provisionally released; the average prison life has been 20.5 months, only 7.8 per cent. remaining over 3 years. Of the 1,476 "indefinites" paroled (.04 per cent. paroled twice and one-half of 1 per cent. three times), 59 per cent. served the probation well and received their release, 7 per cent. are now serving well on parole, in all 66 per cent. known to be doing well. By estimating that one-half of those lost sight of (in all 114) and one-half of those discharged by maximum expiration of sentence (in all 192) and one-third of the 125 sent out of the State have taken to criminal courses, and adding the number of those returned to the prison while on parole and now there, the superintendent finds himself entitled to say that, in all probability, 20 per cent. only have not been reformed by instruction at his institution. The work at the Massachusetts Reformatory is far larger; there is no maximum age limit, and a previously convicted person may be sent to it. This reformatory may be said to have just begun its work.

II.—NOTES FROM CATALOGUES AND REPORTS OF INSTITUTIONS.

CALIFORNIA.

City and County Industrial School, San Francisco, Cal.—Ten per cent. of the inmates of this institution were committed to it because of criminal offences, almost all the others owing their commitment to their idle and dissolute life. Twenty per cent. were recommitments; 27 per cent. had lost their fathers, and 14 per cent. were 12 years of age or under. The girls' department of the school is under the Sisters of Mercy. The school consists of 5 classes, in which the common school studies were pursued for 6 hours daily for 240 days, with an average attendance of 63. The boys are taught shoemaking and tailoring.

COLORADO.

State Industrial School of Colorado, Golden, Colo.—Of the 311 inmates admitted since the school was opened in 1881, 29 per cent. had been committed for non-criminal acts; 70 per cent. had been committed for 3 years; 47 per cent. were 12 years of age or un-

der; 33 per cent had lost their fathers; 23 per cent. had previously been arrested. The school is divided into 3 families and the school course into 4 grades. Instruction is given in carpentry, tailoring, and broom-making. Four hours 5 days weekly are devoted to the school-room and 5 hours to the shop.

CONNECTICUT.

Connecticut State Reform School, Meriden, Conn.—Of the 4,074 commitments made to this school since its establishment, 38 per cent. were held on charges of incorrigibility, truancy, vagrancy, etc., and 44 per cent. were twelve years of age or under. "The boys that come to us," says the superintendent, "are usually recruits from the street loiterers and corner loafers that infest our towns and cities—those who have never known what honest and productive labor signified." On the completion of the two cottages now building, the school will be conducted on the cottage system purely, the additions permitting the necessary classification. The school has a library of well-selected books, having been substantially aided by a gift of \$1,100 from the Hon. I. C. Lewis. Of the 419 pupils remaining in the school at the close of the school year 1886-87, 25 per cent. could not read or could read only in the First Reader, 64 per cent. could not write or wrote only easy words, and 36 per cent. knew nothing of arithmetic when admitted. All the boys attend school three hours for six days of the week for ten months. The schools are divided into ten grades, particular attention being given to reading, writing, and arithmetic. Three hundred boys are employed in the six shops, three-fourths of whom are employed in caning chairs.

ILLINOIS.

Illinois State Reform School, Pontiac, Ill.—The 255 inmates of the Illinois State Reform School were criminals in so far as indicated by the offence for which they were held. Thirty-seven per cent. had previously been convicted of a crime, 13 of them 5 times or more; 15 per cent. were 12 years of age or under. Thirty-two per cent. could not read or read only in the first reader, and 75 per cent. had never studied arithmetic or did not know the multiplication table. The system of reporting monthly to the parents of the pupils of the school has been very successful, a large number of parents taking a lively interest in such reports, and when delayed the superintendent is sure to receive letters inquiring the "reason for delay and whether the report is not up to required standard." It is found that the reports are compared with those obtained by the other children of the family who are in the public or other schools, and praise or blame, as the comparison may be favorable or unfavorable, is written to the pupil at the reform school. The boys of the institution are let out on contract and are engaged in making women's shoes. As the contract would expire in September, 1887, the board of trustees urged the desirability of providing employment for the inmates, as otherwise they would have no employment after the 4 hours of school work. The board does not believe that the contract is the best system, but it will be satisfied with its continuance, inasmuch as it is the only chance that the pupils have had to learn a trade during a period of life beyond which it is very difficult to learn.

Illinois Industrial School for Girls, South Evanston, Ill.—Of the 145 girls received during the year, 122 had been committed, the rest being charity scholars or boarders; about half of them were 12 or under. The common school branches and sewing are taught.

INDIANA.

Indiana Reformatory Institution for Women and Girls, Indianapolis, Ind.—This institution has 2 departments, a penal and a reformatory section. In the reformatory department each girl is required to attend school for half of each school day, and pursues the common school studies. The manual work is domestic duties and cane-seating. Good homes are constantly being offered to the pupils, who are sent out on ticket of leave as soon as fitted for the duties they will be called upon to perform, each being furnished with an outfit on leaving. All money earned by her is placed to her credit. The pupils sent out on ticket of leave during the year, all of whom are under the supervision of the authorities of the school until majority, were 34, of whom 4 had been returned as incompetent. Of the 38 girls committed during the year, 26 per cent. were 12 years old or under.

Indiana Reform School for Boys, Plainfield, Ind.—This school is conducted on the cottage plan. The pupil spends half the day in working and the other half in school. The boys work on the farm, make bricks and lay them, but no regular industries have as yet been introduced. Corporal punishment can only be administered by a written order of the superintendent.

KENTUCKY.

Louisville Industrial School of Reform, Louisville, Ky.—Of the 90 male pupils admitted during the year, 42 per cent. were under 12, 74 per cent. had been committed as incorrigible, homeless, or vagrant, and 34 per cent. had lost both parents or their fathers. Of the 109 boys (white and colored departments) and girls received during the year 48 per cent. were unable to read or were just commencing the primer, and 44 per cent. had never studied arithmetic. The course of study consists of instruction in reading, writing, arithmetic, and geography. The industrial departments, though financially a success, have been "too limited and crude," a condition best remedied by the introduction "of a more perfect manual training system." The principal industries are cane-seating, followed by 107 persons; shoemaking, followed by 12 white boys; and farming and gardening, followed by 15 colored boys.

MAINE.

State Reform School, Cape Elizabeth, Me.—Of the 1,821 boys committed to this institution from its establishment to November 30, 1886, 30 per cent. had been committed as truants, runaways, idlers, etc., 40 per cent. were 12 years of age or under, and 32 per cent. had lost their fathers. The school instruction consists of the common school studies, followed by 137 inmates during the year covered by the report, under 4 instructors, who in their report to the trustees observe: "We regard school work and instruction as among the most important agencies that can be used for the reformation of boys." The feeling in favor of the family and cottage system at this school is very pronounced; "The need of a better classification of the boys, and of the introduction of the 'family principle,' was felt in the early days of the institution." A well-equipped shop, enabling systematic instruction to be given to boys, is under the charge of an able instructor, the repairing and improvements at the school furnishing an excellent opportunity of applying the principles taught.

MARYLAND.

Saint Mary's Industrial School for Boys of the City of Baltimore, Baltimore, Md.—The total number of inmates in the institution, November 30, 1886, was 459, of whom 5 per cent. had not been committed. The institution is not only for youthful offenders against the law, street beggars, etc., but also for destitute and orphan boys. In the school-room the common school studies are pursued; in the shops, printing, tailoring, shoemaking, and cigar-making.

MASSACHUSETTS.

Boston, Mass., Reformatory Institution, Deer Island, Boston Harbor.—Of the several public institutions for the reception of the criminal, indigent, and vagabond classes on Deer Island, two, the House of Reformation and the Truant School, are for the class under consideration. Of the 71 persons (68 boys and 3 girls) committed during 1886 to the House of Reformation, 32 per cent. were committed for non-criminal offences, mostly stubbornness, and 30 per cent. were under 12. Of the 103 boys committed to the Truant School all were committed for truancy, and 86 per cent. were 10 to 14 years of age. "It is doubtful," says the chaplain and superintendent of schools of the Deer Island institutions, "whether there is another penal institution in the land where the temporal and spiritual wants of the inmates are more liberally provided for than in the city institutions located on this island. If the inmates could be classified so that the more vicious could be kept by themselves, it would greatly help reform." There are 5 schools—4 for boys and 1 for girls—under 1 female and 4 male instructors, and while the majority of the pupils do not love study, there are many who are really bright and proficient. The number in school was 189 boys and 8 girls, of whom 165 could "read books generally."

State Primary School at Monson, Mass.—Of the 111 children received at the school during the year, 36 per cent. had been committed as juvenile offenders, the rest being dependent or neglected children. There has been a constant decline in the number of inmates for the last 8 years, which is mainly ascribed to the operation of the changes made in the "settlement laws," causing a decrease in the number of children received from the State alms-house. The full effect of this diminution in the installment from the alms-house in reducing the attendance, however, has been modified by the enforcement of the acts of 1882, relating to the care and custody of "neglected and dependent children." For the period 1879-82, the average received from the alms-house annually was 113, while for the next following quarterly period the annual average was 70.5; during the latter period the annual average of neglected children received was 25.8, and of dependent children 21, in all an annual addition

on the average of 46.8 to the number received from the alms-house. More than 40 boys were employed on the farm. All the members of the five highest schools are compelled to work one half of the day and attend school the other half; those in the lowest schools receive instruction during the whole day. The school has 8 grades or "schools," and a kindergarten.

Lyman School for Boys, Westborough, Mass.—Of the fifty-nine commitments during the year, all but three were made by various courts of law, and to these fifty-nine must be added two cases of recommitment. Of the commitments 23 per cent. were orphans or had lost their fathers, 88 per cent. had been inmates of other institutions or arrested before, and 25 per cent. were 12 years of age or under; 28 boys had been returned and 14 had come back to the institution of their own accord; 8 escaped. The system followed is the "open" or cottage plan, which the buildings lately added now permit. Twenty-one boys on an average were employed in caning chairs, the other work done being for the most part about the house or in the field.

The State Industrial School for Girls, Lancaster, Mass.—The commitments to this institution during the year ending September 30, 1886, were 51, and the number of those for whom places were obtained or who were returned to friends or discharged was 64, of whom 48 per cent. were returned, mostly for bad or unsatisfactory conduct, and 1 escaped; 18 per cent. of the commitments were for offences against public morals, and 12 per cent. against public justice, the others being merely wayward or vagrant girls; 76 per cent. of the new pupils were between the ages of 14 and 16, none were under 13; 9 per cent. were illiterate. The school is conducted on the open system, and is divided into families of 25, the influence being, as far as possible, such as it would be in a good home. The pupils are employed in house-work, and on the farm and in the garden.

Massachusetts Reformatory, Concord, Mass.—Seven per cent. of the persons sent by the courts to this institution (561) during the year ending September 30, 1886, ranging in age from 14 to 65, were committed for crimes against the person, 45 per cent. for crimes against property, and 47 per cent. for drunkenness, licentiousness, vagabondism, etc. Of the 615 received during the year 19 per cent. were to serve an "indeterminate sentence." Of the number in the institution at the close of September, 1886 (660 prisoners), 54 per cent. had served a term in other institutions, and of these 47 per cent. had been committed more than once. Thirty-two per cent. of those received during the year were between the ages of 15 and 20, and 38 per cent. between 20 and 30. Four hundred and thirty-five prisoners were released on permit and 30 permits were revoked. The schools are of three grades—primary, intermediate, and advanced, in which are enrolled 315 inmates under 10 teachers. The work of the primary and intermediate grades is that of the public primary and grammar schools; in the advanced grade algebra, arithmetic, history, book-keeping, and French are taught; drawing is taught to a class of 25. The industries taught principally are shoemaking, tailoring, and harness-making.

MICHIGAN.

State Industrial Home for Girls, Adrian, Mich.—Nineteen per cent. of the girls received during the year were 12 or under. The pupils are located in 5 cottages, each containing about 30 or 35. The course of instruction is graded from the primary to the full grammar; in addition to this instruction the pupils are taught sewing and house-work.

Detroit House of Correction School, Detroit, Mich.—The number enrolled in the school is 140, of whom 29 per cent. were illiterate on entering. The instruction given is elementary, and is under a teacher assisted by several of the more advanced prisoners.

Reform School, Lansing, Mich.—During the 2 years covered by the report, 381 persons were committed to the school, 45 per cent. of whom had been convicted of slight offences, principally truancy and disorderly conduct. In addition to those received on commitments, 48 former inmates were returned, making 429 in all, of whom 34 per cent. were 12 or under. The school day of 9 hours is equally divided between study and work. In the school nothing is attempted beyond thorough instruction in the common school branches. Over 200 boys were employed in the cane shop, about 50 in the tailoring department, and 70 on the farm.

NEBRASKA.

State Reform School, Kearney, Nebr.—The following statistics are given for the number of persons committed to the institution since its opening in 1881. The number received has been 208, of whom 45 per cent. were committed on slight offences, 30 per cent. were orphans or had lost their fathers, and the same percentage were 12 or under. The school is divided into families, of which there are 4. Each inmate is

instructed in the common school branches 4 hours daily, the other part of the day being given to manual labor. Military drill was introduced during 1886, and has been found a valuable aid in promoting order.

NEW HAMPSHIRE.

State Industrial School, Manchester, N. H.—The number committed to the institution during the year was 154, 24 per cent. of whom were convicted of slight offences,—disobedience, idleness, and the like,—34 per cent. were 12 years old or under, and 40 per cent. were committed during minority. The building erected by the principal and accumulated interest of the appropriation of 1879 has enabled the school to embark upon the manufacture of hosiery, at which industry half of the boys and girls are daily employed. The school has several funds, the interest of which is used in adding to the library. The common school studies are taught.

NEW JERSEY.

New Jersey State Reform School, Jamesburg, N. J.—The commitments during the year were 120, of whom 29 per cent. were committed for incorrigibility, etc., and 32 per cent. were 12 or under. Thirty-one per cent. had previously been arrested, and 23 per cent. were orphans or had no fathers; 39 former inmates were returned to the school during the year and 8 pupils escaped. Forty-three per cent. of the new pupils could not read, or read only in the first reader, and only 1 could read in the fifth. The daily instruction in the school has been lengthened from 3 to 4 hours, with a corresponding reduction in the hours of labor. The boys are engaged in cultivating the farm and are instructed in carpentry, shoe-making, blacksmithing, etc.

Newark City Home, Newark, N. J.—The large number of illiterates received during the last two years has almost reduced the school-room work of this institution to primary teaching; the advanced classes pursue arithmetic, geography, and history. The sessions of the school last for 6 hours daily. The inmates work on the farm and in the brush shop connected with the institution.

NEW YORK.

The Burnham Industrial Farm, Canaan, Four Corners, N. Y.—The property of this recently established institution consists of a farm of 580 acres formerly occupied by a Shaker community. It has on it several dwelling-houses, shops, and extensive barns, etc., one of the buildings containing a steam-engine and boilers. The religious influence is Protestant, but not denominational. Besides the agricultural pursuits which the great extent and splendid condition of the farm invite, the trades of carpentry, blacksmithing, etc., will be introduced at the earliest practical moment. The inmates are given the rudiments of a common school education; the daily session is of 2 hours.

New York State Reformatory, Elmira, N. Y.—Education is compulsory here. Of 2,378 inmates received during the last ten years, 20 per cent. were unable to read or write, and though 53 per cent. could do both they practised those arts with difficulty. Of the 711 inmates on September 30, 1886, 90 per cent. could read and write fluently, the others being in the rudiments of language. At the close of each of the three terms into which the school year has been divided, those having passed the last monthly examination are promoted, the proportion of men advanced ranging from 50 to 80 per cent., the percentage being smallest in the primary division. To endeavor to invigorate the understanding of 12 incorrigible dullards, not one of whom knows the name of the country in which we live, they were subjected to a 5-months' course of daily vapor baths, massage, and calisthenics. As the course progressed "their minds brightened," and "from being fairly contented to remain in the lowest grade an ambition to earn perfect records guided the conduct and work of all." The average marking according to the school register was 45.25 before the experiment began, and 74.16 at its close.

New York House of Refuge, Randall's Island, N. Y.—Four hundred and forty-six commitments were made during the year to this institution, of which 54 per cent. were for the slight offences of vagrancy, etc.; the percentage that were 12 or less than 12 years of age was 24, and of those who had been previously arrested, 40. The common school studies are taught very thoroughly and with excellent results. It is contemplated to replace contract labor by a system of agricultural and horticultural training upon ground to be reclaimed, giving the institution about 20 acres of arable land; to carry out the project in part the Legislature is asked to appropriate \$25,000. At this school the younger and less hardened boys are carefully separated from the hardened inmates, each class having its own eating and sleeping apartments, and play-grounds.

OHIO.

Boys' Industrial School, Lancaster, Ohio.—Two hundred and sixty-one boys were committed to this school during the year covered by the report, of whom 29 per cent. were 12 or under, and 30 per cent. were orphans or had lost their fathers. Eighteen inmates that had been released were recommitted, and 12 of those detained escaped. Half the day is spent in school, the other portion being devoted to farming, gardening, blacksmithing, shoemaking, etc. The school is conducted on the family system, being located in 11 buildings.

Cincinnati House of Refuge, Cincinnati, Ohio.—Seventy per cent. of the 367 committed to this institution during the year were detained for slight offences, and 46 per cent. were 12 or under. Fifty-three per cent. were orphans or had lost their fathers, 28 per cent. had been arrested before, and 39 per cent. could not read, or read only in the first reader. The pupils are divided into families, of which there are 4 for the boys and 2 for the girls, each family having its own school, play-ground, workshop, etc.

PENNSYLVANIA.

Pennsylvania Reform School, Morganza, Pa.—Of the 412 persons committed to this school during the two years covered by the report, 83 per cent. were sent on charges of incorrigibility or vicious conduct, 33 per cent. were under 13 years of age, 43 per cent. could not read, or read with difficulty, 29 per cent. were orphans or had lost their fathers, and 3 per cent. were recommitments. The school is conducted on the family system, and the inmates, divided into six families, are required to attend school 6½ hours daily. The pupils are taught shoemaking, tailoring, and brush-making.

House of Refuge, Philadelphia, Pa.—The crowded condition of this institution has induced the board of managers to ask that the buildings of the school be purchased by the State, in order that an agricultural reform school on the family plan may be established with the proceeds. The schools, 17 in all, giving a good elementary education, are under a superintendent and 19 teachers, including a teacher of music. In the industrial department shoemaking, cane-seating, and tailoring, are taught.

WISCONSIN.

Wisconsin Industrial School for Girls and Young Boys, Milwaukee, Wis.—This institution is for girls under 16 and boys under 10, and receives in addition to those committed to its care by legal process a number of charity pupils, who are supported by a fund made up by the citizens of Milwaukee. A kindergarten has been established in connection with the schools.

* From the Report of the Commissioner of Education for 1885-86.

Examination shows that 19 schools on the list of the Report for 1882-83 have not reported for the year under review, and 8 on the list of the present Report were not on the Report of 1882-83, although only 3 have been established since it was issued. Comparisons instituted between two bodies of statistics made up from returns from so many institutions that are not common to both would be misleading, and the Office has refrained from giving the increase or decrease, as the case may be.

V.—EDUCATION OF THE INDIAN.¹

EDUCATION OF THE UNCIVILIZED TRIBES.

As to their source of support, Indian schools may be divided into three kinds: those supported by the National Government (in New York by the State) directly or indirectly (contract); those supported by religious societies; and the public school systems of the Five Nations of the Indian Territory. Viewed as educational institutions, they may be separated into boarding schools and schools for day scholars, and this is the classification that has been adopted as best suited to the purposes of this Report; the systems of the Five Nations, however, will be considered apart.

ACCOMMODATIONS, ATTENDANCE, AND COST.

"It is a noteworthy fact," says Superintendent Riley, "that where schools have been established for several years, with accommodations for a considerable proportion of the children of school age, the prejudice [of the Indians] against education has largely disappeared;" and again, "If the Government would be rid of the Indian question educational facilities must be provided for the present generation of Indian children." By the treaties of 1867 and 1868, made with a number of tribes, the Government agreed to furnish school supplies, including building, and a teacher for every 30 children. To meet the obligations thus incurred, but not yet fulfilled, the Secretary of the Treasury submitted estimates in 1885 for an appropriation of \$4,033,700.

Accommodations.—From the insufficiency of the appropriations the Indian Bureau has been able to provide for only a small proportion of the children of the larger tribes; the treaty stipulations with the Navajoes, for instance, calls for 200 schools; one has been provided. The following table shows the school population and the provision made for educating it:

TABLE 88.—*School population and accommodations for uncivilized Indians for 1886-87.*

Total	170,025	41,876	5,810	3,400	2,020	540	28,395

¹ The matter contained in this section is taken from or based upon the comprehensive report of Hon. John B. Riley, superintendent of Indian Schools.

a "There are probably upwards of 7,000 children of school age in Alaska," says Superintendent Riley, "more than nine-tenths of whom are children of the native [non-Indian] population." Contracts were made for the education of 100 pupils at two boarding schools.

b 5-21, for 1885-86.

Excluding the Indians of school age on reservations in New York (1,711 in 1885-86), where the accommodations appear to keep pace with the demand for admittance, the table shows that twenty-nine per cent. (11,770) of the children are provided for. How far this provision is utilized is shown by the following table.

Enrolment and average daily attendance at Indian schools.

Schools.	Enrolment.	Average daily attendance.
Boarding:		
Bonded superintendent class.....	2, 150	1, 753
Indian agent class.....	4, 731	3, 487
Contracting with United States Government.....	3, 283	2, 513
Day:		
In charge of Indian agents.....	3, 123	1, 894
Contracting with United States Government.....	1, 161	598
Missionary.....	484	215
New York.....	1, 061	493
	15, 993

Excluding the New York statistics, it appears that the accommodations are 79 per cent. of the enrolment and, if it be assumed that the total of the average attendances more or less closely represents the true average attendance, the ratio of such an average attendance to the accommodations would be 89 per cent. The language of the treaties above referred to, substantially the same in all, is as follows: "and they [the Navajoes] therefore pledge themselves to compel their children, male and female, between the ages of six and sixteen years, to attend school, and it is hereby made the duty of the agent for said Indians to see that this stipulation is strictly complied with." The statistics would appear to indicate that the Indians are availing themselves of the educational facilities provided for them to the full extent of such provision.

English language in Indian schools.—"The advantage to the Indians of a knowledge of our language can not be overestimated. * * * Understanding English, they can deal directly with their white neighbors and the representative of the Government. * * * They will no longer be the prey of unprincipled white men. In fact, the Indian who speaks the English language is a savage no longer." Continuing, Superintendent Riley quotes from the report of the Indian peace commission, appointed in 1867 for the purpose, among others, of suggesting some plan for the civilization of the Indians: "In the difference of language to-day lies two-thirds of our trouble. * * * Schools should be established, which children should be required to attend; their barbarous dialects should be blotted out and the English language substituted." The superintendent found that in some schools, though he was understood by the pupils when he spoke, they could not express themselves in English, although they had been in school several years.

Course of study.—The efforts of the Indian Bureau to control the work in the school-room has so far been rendered futile by the total lack of system as to text-books and course of study. Each agent or superintendent selects the books and methods that appear best to him, and "the results attained vary as widely as do the methods pursued." To rectify this evil the superintendent recommends the adoption of a series of text-books and a course of study. "Indian education," he observes, "is yet in its infancy. An elaborate system is in process of formation. The enactment of laws enlarging the responsibilities of the Indians and looking to their citizenship makes it important that a well-considered and thoroughly organized system be devised for carrying on a work that will necessarily involve the employment of a large number of persons and the expenditure of many millions of dollars, and will in its operation determine in a large measure the future of the Indian race."

Finances.—The sources from which the money for Indian education is obtained are three: Congressional appropriation; treaty, interest, and other funds; and the treasuries of missionary bodies. The following table exhibits the proportion in which the sum total is contributed to and disbursed:

TABLE 89.—*Receipts and expenditures of schools for the uncivilized Indians, for 1886-87.*

BOARDING SCHOOLS.

As before remarked, the schools for educating the Indian are here classified as boarding and day schools; the first of these classes admits of subdivision into schools under bonded superintendents, under Indian agents, and under societies or individuals either as contractors with the United States Government or as independent missionary enterprises. The specific difference between schools controlled by employés of the Government under the name of superintendent and those under the authority of United States Indian agents is more than one of name. "Experience has shown," says Superintendent Riley, "that the schools so conducted [under the direction of bonded superintendents] have shown much better results than have been attained at the schools supervised by Indian agents;" and further, "in the selection of Indian agents men of good business qualifications are sought. Even if they could devote the time required for the proper supervision of the schools to that work, but few of them would be found to have had the experience or to possess the special qualifications requisite to the successful performance of such duty."

Schools in civilized communities.—To obtain information as to the most desirable location for Indian schools, the Commissioner of Indian Affairs sent a circular letter to the Indian agents asking for information as to the number of children returned from the Eastern schools; the pursuits in which they were engaged; the number who continue to wear civilized dress; and the agents' opinion as to the value of the work done in these schools in comparison with that done on the reservation.

The incompleteness of the record as to the departure and return of children prevented full returns; but the life of 388 pupils who had returned were given by 11 agents. Of these 89 died, 74 were engaged in civilized pursuits, 31 were employed at the agencies, 17 attended school, 12 were not engaged in any occupation, 74 had apparently retrograded and had adopted Indian costume, and 43 had been lost sight of. The large percentage of those who died after their return to reservation life, the radical dissociation of parent and child, and the great difference between life in a civilized community and on the frontier, induces the superintendent to recommend that none but graduates of the reservation schools be sent to Eastern boarding schools, and to suggest that the course of instruction at those schools be adapted to training teachers, professional men, or artisans.

New schools.—Four new schools have been established during the year, situated respectively at Albuquerque, N. M., San Carlos and Keam's Cañon, Ariz., and Grand Junction, Colo. At three of these schools ample facilities are present to enable instruction to be given in irrigation, an essential element of farming in these regions. All the schools appear to belong to the bonded superintendent class.

¹ For 1885-86.

Contract schools.—Many of the buildings erected by the various organizations with which the United States contracts surpass in size and beauty those built by the Government. Nor are their efforts confined to providing suitable accommodations, for the teachers and employes they have secured are as a rule enthusiastic in their efforts to civilize the Indians, frequently giving instruction to grown persons as well as children. In many instances the number of children instructed is much greater than the number contracted for, the additional expense being met by religious denominations, principally the Presbyterian, Catholic, Protestant Episcopal, and Congregational churches.

Number, capacity, and attendance at boarding schools for uncivilized Indians, for 1886-87.

Bonded superintendents.....	204	195	\$27, 063
Indian agents.....	74	83	7, 406
Private management (contracting).....	63	5, 929

Teachers.—The small salary of the teachers and the hardships and inconveniences of the service have caused many changes in the teaching force during the year. To retain the service of teachers "whose language, habits, and character are worthy of imitation" the superintendent thinks it better policy to pay higher salaries, and, if absolutely necessary to the accomplishment of this end, have fewer schools.

Teachers in boarding schools for uncivilized Indians, and their salaries, for 1886-87.

Schools under—	Teachers. ^a		Whole number of employes.	Ratio of school teachers to whole number employes.	Average annual salary.	
	School.	Industrial.			Superintendent.	Teachers.
Bonded superintendents.....	44	6	229	19.21	\$1,373	\$613
Indian agents.....	100	46	472	21.19	822	578
	144	52	701	589

^a Not including superintendent, unless that officer is also designated as a teacher, or, if not so designated, has in his institution an "assistant teacher."

Two columns of the above table (the second and the last) call for remark by reason of certain limitations which must be considered with them.

In his remarks on teachers' salaries Superintendent Riley uses the following language: "To insure success every employé must be a person of character and intelligence. The cook, the laundress, and the seamstress are all teachers in their different spheres." In view of this statement, six would very inadequately represent the number of teachers giving industrial instruction, however accurately representing the number of persons on the pay-roll as such; on the other hand, it is impossible to distinguish how far the various farmers and assistant farmers and the seamstresses and assistant seamstresses, are farmers or seamstresses and how far teachers. Confined to the examination of the pay-rolls of the various schools (Exhibit No. 4 of the superintendent's report) in collecting information for the table, the Office has used, not the amount actually paid to teachers for service rendered, as a basis, but the amount that would have been paid had every teacher held his position from the beginning until the close of the year. To have done otherwise would have demanded many computations and, though giving the amount actually expended on the teaching force, would not so well have answered the purpose of the column as showing the average annual salary as provided for. Of the bonded superintendent class of boarding-schools 66 per cent. of the salaries were of the \$600 grade, 16 per cent. were below that grade, and 18 per cent. above; of the Indian agent class, 35 per cent. of the salaries were of the \$600 grade 22 per cent. above it, and 31 per cent. were of the \$480 and \$500 grades.

^a Including salaries of superintendent and industrial teachers as teachers' salaries.

DAY SCHOOLS.

The utility of day schools for the Indians naturally depends on the extent to which the tribes have discarded nomadic habits or their teachers become nomads. It is evident from the wording of the treaties of 1867 and 1868 that day schools were contemplated, but it will be seen by referring to Table p. 869 that the enrolment at boarding schools is double that of the day schools, omitting the enrolment in New York day schools, although the number of schools are about equal. An interesting feature of the work of the American Missionary Association is the establishment of "out stations" with native teachers graduates of the Santee and Oahe boarding-schools maintained by this society.

SCHOOL SYSTEMS OF THE FIVE NATIONS.

The citizen population of the Indian Territory, including mixed bloods, freedmen, and adopted citizens, is about 64,000, to whom are to be added about 34,000 other persons—farmers, traders, claimants to citizenship, etc.

Cherokees.—This nation, the largest, having a citizen population of 23,000, maintains 2 boarding-schools and an orphan asylum capable of accommodating 550 pupils, and 100 day schools with a capacity of 5,000. In addition to the public schools there are at least 10 other schools, mostly if not all denominational, 7 of which have, together, accommodations for 549. The Nation gives the negroes 12 common schools and the question of providing a high school for them is agitated. The aggregate attendance was 4,200, the average attendance 2,600, and the cost of the national schools \$80,000.

Choctaws.—With a population of 18,000 this Nation maintains 4 boarding-schools with a capacity of 300 fully utilized, at an expense of \$31,000; sends 13 boys and as many girls to schools in the States at a cost of \$7,025; and supports 83 "neighborhood schools," having an aggregate attendance of 3,512, at an expense of \$44,154. The annual appropriation was \$82,269. The school year begins in September and closes with February, for the "neighborhood schools." School property is valued at \$200,000. Of the private and church schools no data can be obtained.

Creeks (population 14,000).—Besides the 5 schools having a capacity of 410, maintained by the Nation at a cost of \$25,200, numerous other boarding-schools, principally denominational, afford opportunities of education. Of the 28 public schools, having a capacity of 700, 7 are for negroes; the cost of these public schools was \$11,600. Twenty-one pupils are supported at schools in the States at a cost of \$6,500.

Chickasaws (population 6,000).—The 4 boarding-schools of this Nation have a capacity of 310, and the 14 common schools of 230; beyond these no statistics are furnished.

Seminoles (population 3,000).—The Nation supports two high schools (boarding), with accommodations for 98 pupils, at an expense of \$6,300, supplemented by grants from the Presbyterian and Methodist churches, amounting in all to \$2,300. Of the 4 district schools and the schools supported and controlled by religious denominations no statistics have been furnished.

VI.—EDUCATION OF THE COLORED RACE.

The scope of this section being to collect under one head the statistics relating to the education of the colored race dispersed through the Report, the following matter is presented in a summarized form, individual mention of an institution coming properly in the particular chapter in which it has been deemed proper to place it.

PUBLIC SCHOOLS.

h For 1885-86.

Of the 18 systems represented in Table 90 only 9 have recently taken a census, 4 are still using the census of 1880, and 4 have not been able to furnish the Office at this date with statistics for 1886-87, while in Kentucky and Alabama the city schools are excluded, and in Delaware the 4 colored schools of Wilmington. Under such conditions, and excluding the statistics of Florida and Indiana, the comparison of the statistics of 1886-87 with those of the preceding year shows a gain of 28,413 in colored enrolment, a gain of 2.7 per cent., and of 124,128, a gain of 4.5 per cent., in white enrolment. Excluding 5 States and the District of Columbia, all using a census taken previous to 1835, the ratio of the colored enrolment of the other States given in the table to their colored population is 51.6 per cent.; of the white enrolment to white population, 64.06 per cent. The ratio of the colored school population of the 17 States and the District of Columbia to the total school population, white and colored, is 28.96, or, excluding Missouri, West Virginia, and Indiana, in which the colored school population is not 10 per cent. of the total school population, 36.85 per cent. The enrolment in colored schools is 24.25 per cent. of the total enrolment, or 32.55 excluding Missouri, West Virginia, and Indiana as before. It is thought that the analytical character of Tables 91 and 92 renders further remarks unnecessary.

In Table 91 the variation among the several States of the ratio which the colored school population bears to the white can not fail to be noted. In North Carolina the colored-school population is 38 per cent. of the total school population, in South Carolina it is 64 per cent., in Georgia it is 48 per cent., in Arkansas it is 26 per cent., in Louisiana 52, in Missouri and West Virginia it is below 6 per cent. Considering the strict separation of schools for educating colored children, and that the life of the colored man is agricultural, it would seem that the colored schools of States with a comparatively small percentage of colored youth would be nearly under the same disadvantages that attend the first educational efforts of a sparsely settled State or Territory.

Although fostering the industrial education of the colored population as the trustees of the Peabody fund have fostered normal instruction "among the entire population" of the South, the trustees of the John F. Slater fund, through their agent, Dr. Haygood, of Georgia, are indefatigable in collecting information as to the condition and progress of the people whose elevation is the purpose of their trust. In February, 1887, Dr. Haygood sent out 300 circular letters "asking the best judgment of those to whom they were sent, on the matters inquired about." Two of the inquiries made are connected with the subject of education: Do colored parents manifest interest in the education of their children? Are the common schools attended by colored children improving in their character? From the 300 letters of inquiry thus sent to officials, educators, and professional and business men, white and colored, 236 replies had been received by May, 1887. To the inquiry as to the interest of colored people in the education of their children 230 answered "yes," to which should be added the response, "There were only two colored families in my neighborhood, and one moved away to get near a school"; no correspondent denied that an interest was manifested, the 5 not answering in the affirmative speaking of it as spasmodic or limited. To the second query, a very material one, as to the improvement in the character of the common schools as educational institutions, 199 respond affirmatively, 6 of whom deny like improvement in the private schools, 20 do not know or do not answer, 4 think not. Personal and diligent inquiry throughout the South causes Dr. Haygood to believe "that the answers given by the majority of those who replied to his circular letter give the true view on the questions asked."

NOTES FROM THE REPORTS OF STATE SUPERINTENDENTS.

Alabama.—The census of 1887 shows that during the biennial period then closed the white school population had increased 8.4 per cent., and the colored 5.7, an increase in all of 7.2. "This large increase in the number of children," says Superintendent Palmer, "reduces the per capita from 73 cents for both white and colored to 72 for white and 66 for colored" for the year 1887-88 notwithstanding the increase of \$20,000 made to the school fund. The greater reduction in the per capita for colored children is due to the liberal appropriations made by the last Legislature out of the fund for whites for the university for the colored people, and for normal schools.

Delaware.—In 1876 the present incumbent, H. C. Conrad, Esq., was appointed Actuary for the Delaware Association for the Education of the Colored People, in whose hands the education of the colored people was placed in 1875. On his advent to office he found 29 schools in existence, having an enrolment of 1,197, "supported by donations from this association and contributions made directly by the colored people." In 1881 the State made the first direct appropriation, which was materially increased in 1883, and still further augmented at the last session of the General Assembly, when the amount was raised from \$5,000 to \$6,000 annually, the law touching

schools for this race simplified, and permission granted to the colored people of Dover and of Cedar Creek Hundred to elect their own trustees, who should levy and collect a school tax and provide for the maintenance of colored schools in the districts at the same time created. The total amount distributed to the schools was \$7,057.56, of which \$4,713.23 came from the State and \$2,344.33 from the school-tax fund. "Each year," says the actuary, "shows an improvement in the corps of teachers, those of the past year being, I think, better equipped in point of education and experience than those of any preceding year." During the year the Delaware Association for the Education of Colored People, which had been engaged for the last 20 years in the education of colored youth, was disbanded, and the African School Society, incorporated in 1824, assumed the work. The two organizations were practically identical.

Kentucky.—In 1882, the annual capitation tax of \$1 on each male colored person above the age of 21, reserved exclusively for and the principal source of support of colored public schools, was repealed as unconstitutional by the General Assembly, reducing the per capita amount available for colored children from 43, for 1880, to 13 cents, for 1883. To obviate the ill effects of this the people voted "an additional 'tax of 2 cents on each \$100 of property in this Commonwealth, subject to taxation for State revenue purposes,' for the benefit of the common school fund," and at the same time made the per capita and the school age the same for white and colored children. The result of this action is best shown by comparing the financial operations of 1880, in matters relating to education, with the operations of 1886. In 1880 \$598,193, or \$1.25 per capita, were appropriated for the white and \$31,951, or 48 cents per capita, for the colored. In 1886 the apportionment for the white schools was \$865,052, a per capita of \$1.65, and for the colored \$164,429, a per capita of \$1.65. In 1882-83, the first year of the new order of things, \$106,117 were disbursed for colored public schools, of which 16 per cent. were received from colored tax-payers; in 1885-86 \$167,666 were disbursed for colored schools, of which 8.6 per cent. were from colored tax-payers. "That the people," says Superintendent Pickett, in his report for 1886, which should be considered rather as a retrospect of an important educational period, "should, by their own act, draw the revenue from the white schools at so large a rate each successive year, to supplement the meager sum contributed by the colored people, is the most remarkable fact in the school history of Kentucky. That it should all be accomplished quietly and successfully without interruption of the schools, leading, at the same time, to a higher qualification of teachers, because required, and, consequently, to a higher standard in the schools * * * makes this an era in her history."

SCHOOLS FOR NORMAL, SECONDARY, AND COLLEGIATE EDUCATION.

In considering the institutions for the education of the colored race, it is noticeable how constantly present are the characteristics of a public elementary school, an academy, a normal school, and in some instances of a theological seminary, all in the same institution. These schools have been placed in the various chapters according as one or another feature predominated, and are there mentioned, if at all.

The usual charge for tuition in these institutions is \$1 a month; occasionally the fee falls below this figure, and not unfrequently rises above it, though rarely exceeding \$2. Many of the institutions give instruction free.

Board averages \$6 to \$8 a month. The lowest limit is \$5, while \$10 seems to mark the other extreme. In some instances the student can reduce his expenses or defray them by manual labor at the institution or in the vicinity.

Normal and secondary instruction.—The object of the normal and secondary instruction of the colored students seems to be the thorough grounding of the pupil in the principles of a common school education, with the additional purpose in the normal department of exercising the pupils in imparting the rudiments of the course they are completing. The course of the normal department or school is mostly of 4 years' duration, occasionally divided into a higher and a lower course; frequently the course is of 3 years, sometimes of 2. The secondary school, under its various names of high school, higher English preparatory, or academic course, runs from 2 to 4 years. The requirements for admission are ability to read and write and work examples in the fundamental rules of arithmetic. Some schools refuse to receive applicants under 14 or 15 years of age, as the case may be. In replying to the second query of Dr. Haygood's circular of inquiry referred to, p. 876, in every case where a comment was added to the affirmation of improvement in the colored public schools the cause was attributed to the better teachers furnished by the colleges and other training schools for colored people.

Summary of the statistics of Table 93, showing number of colored students receiving normal, secondary, or collegiate instruction.

Normal	3,924
Secondary	5,263
Collegiate	637
Total	9,824

These 9,824 pupils were taught by 445 teachers, an average of 22.1 pupils to each instructor. The value of the property used in connection with the instruction of these pupils was \$2,978,450, a per capita of \$303.

PROFESSIONAL SCHOOLS.

Of the several classes of institutions for the education of the colored race, only the schools for theological instruction are present in sufficient number to warrant comment. The amount of work done by schools of law and medicine falls far short of that of normal and theological schools. The course in a majority of the theological institutions may be described as simple, being confined to the study of the Bible and church history, while in the case of the recently reorganized Richmond Theological Seminary of the American Baptist Home Mission Society, a systematic and thorough study of theology, including instruction in Greek and Hebrew, obtains, and the same remark holds good of the Gammon School of Theology, controlled by the Freedmen's Aid Society of the M. E. Church, and formerly of Clark University. As remarked above, many of these schools are only departments of institutions that offer in addition, normal, secondary, or collegiate instruction, sometimes all three, thus affording to theological students an opportunity of removing the impediments to their studies, following from inadequate knowledge of the elements of learning. For ministers already in the pulpit one year courses are in some instances provided.

PROVISION FOR THE DEFECTIVE AND DEPENDENT CLASSES.

The colored pupils of the schools for these classes, being either taught with the white pupils or forming a department of a white school, it is impossible to distinguish with precision the number of teachers employed in instructing colored children. Two of the deaf graduates of the North Carolina Institution are teaching in schools in other States and three blind graduates are ministers of the gospel and one is a music teacher.

CHAPTER XV.

NOTEWORTHY GIFTS AND BEQUESTS TO EDUCATION.

The entire amount received by each school, college, or other institution of learning, as reported to this Bureau, will be found, with the other particulars relating thereto, elsewhere in this Report.

The table here presented contains only those gifts and bequests that amounted to \$500 or more. It does not include anonymous benefactions; nor those made by or to church societies or by aid organizations of any kind.

The purposes of the table are, briefly, to place on record the names of the chief benefactors to schools and colleges, and to show the several objects for which their generosity has been excited.

Of the 209 gifts and bequests here tabulated, 25 represented \$50,000 or more; 72 were sums between \$5,000 and \$49,000; and 112 were sums less than \$5,000.

TABLE 96.—*Noteworthy gifts and bequests to schools, colleges, and other institutions of learning during the scholastic year 1886-87.*

Name of giver.	Post-office address.	Name of institution receiving.	Post-office address.	Amount of gift or bequest.	Purpose of gift or bequest.
C. F. Almsworth	Black River Falls, Wis.	St. Lawrence University	Canton, N. Y.	\$500	Endowment.
Henry Almsworth	Versailles, Ky.	Central College	Afron, Ohio	25,000	General uses.
A. J. Alexander	Philadelphia, Pa.	Dickinson College	Richmond, Ky.	10,000	Professorship of philosophy.
W. C. Allison	Late of Moline, Ill.	Pacific University	Carlisle, Pa.	1,500	Scholarship fund.
Charles Atkinson, deceased	Canton, N. Y.	St. Lawrence University	Forest Grove, Oregon	11,000	Endowment.
I. M. Atwood	Lewisburg, Pa.	Bucknell University	Canton, N. Y.	100,000	Library fund.
Dr. W. H. Backus, deceased	Cleveland, Ohio	Oberlin College	Lewistown, Pa.	20,000	Building.
E. J. Baldwin	Newark, N. J.	Rutgers College	Oberlin, Ohio	500	Library.
Robert F. Ballantyne	New York, N. Y.	Howard Seminary	New Brunswick, N. J.	300	Various uses.
Stephen Ballard		Goddard Seminary	Washington, D. C.	7,000	Endowment.
Jonas Barber, deceased		German English College	Galena, Ill.	300	Endowment.
Gilbert Barois, deceased	Bridgeport, Conn.	St. Lawrence University	Canton, N. Y.	2,500	Endowment.
P. T. Barnum	New York, N. Y.	Central University	Brunswick, Me.	5,000	Scholarships.
Judge W. G. Barrows	Angusta County, Va.	Union Theological Seminary	Richmond, Ky.	1,000	Scholarships.
E. B. Bartlett	Massdon, N. Y.	Bates College	Lewiston, Me.	40,000	General uses.
David Baylor, deceased	Philadelphia, Pa.	St. Lawrence University	Canton, N. Y.	3,000	Endowment.
Mrs. Sarah C. Becher, deceased	Woodstock, Vt.	University of Pennsylvania	Philadelphia, Pa.	50,000	Biddle Memorial Law Library.
Lyman Bickford	Tolodo, Ohio	Oberlin College	Oberlin, Ohio	1,000	Scholarship.
George Biddle, family of	Branchport, N. Y.	University of Vermont	Burlington, Vt.	18,000	New wing of library building.
Miss L. Pierce, <i>et al</i>		Ohio Wesleyan University	Delaware, Ohio	21,000	Professorship.
Hon. Frederick Billings		St. Lawrence University	Canton, N. Y.	1,000	Endowment.
Anna Bishop		Richmond College	Richmond, Va.	20,000	Endowment.
P. H. Bidley		Southern Baptist Theological Seminary	Louisville, Ky.	25,000	Endowment.
John A. Bostwick		Wake Forest College	Wake Forest, N. C.	50,000	Endowment.
Mrs. Narcissa S. Bourne		Dowdell College	Brunswick, Me.	1,000	Scholarships.
J. I. Bowditch		Harvard University	Cambridge, Mass.	1,000	Observatory.
Uriah A. Boyden, deceased		Harvard University	Cambridge, Mass.	237,387	Astronomical stations.
Thomas Breslin		University of the South	Swansea, Tenn.	5,000	Buildings.

CHAPTER XVI.

OBITUARY LIST OF NOTABLE EDUCATORS AND BENEFACTORS TO EDUCATION.

The list here presented contains such names among the dead of the year 1886-87, as were notable either for their connection with some form of educational labor or for their gifts and bequests to educational purposes. Of course the list is incomplete, or may be so considered; some names are omitted because no trustworthy information of the kind here given could be procured respecting them; and other names might have been included by the partiality of friends.

No attempt has been made to include some men of eminence whose work as educationists was merely incidental; for example, the late Rev. Henry Ward Beecher was a lecturer for three years in the Yale Divinity School at New Haven; yet Mr. Beecher's name is not included.

These exclusions have been necessary in order to prevent the list from becoming too cumbersome for publication and too vague in design.

Usually facts respecting those included in the list, which relate to other interests or labors are passed over in silence.

A few names, omitted from the report for 1885-86, are included in this list.

AMERICAN.

- ADAMS, James O., in Boscawen, N. H., February 7, 1837, aged sixty-eight years; superintendent of public schools in Manchester, N. H., 1855-59 and 1861-67; secretary of the New Hampshire State Board of Agriculture and editor of its valuable reports, 1870-87.
- AIKEN, David Wyatt, in Cokesbury, S. C., April 6, 1887, aged fifty-nine years; professor of mathematics in South Carolina College, 1849-51; a prominent agriculturist; member of Congress, 1876-84, part of the time being chairman of the Committee on Education and Labor; an officer in the Confederate service during the civil war.
- ANDERSON, Luther W., in Quincy, Mass., June 13, 1887, aged sixty-six years; teacher and head master in the English High School in Boston, 1848-87.
- ASHBURNER, William, in San Francisco, Cal., April 20, 1887, aged fifty-six years; professor of mining, 1874, and regent, 1880, of the University of California, and trustee of the newly endowed Leland Stanford, Jr., University; a well-known geologist and mining engineer.
- AYRES, William O., A. M., M. D., in Brooklyn, April 30, 1887, aged sixty-nine years; a teacher, 1837-52; professor in Toland Medical College, San Francisco, and in the Yale Medical School.
- BARTLETT, John Russell, at Providence, R. I., May 28, 1886, aged eighty years; one of the founders of the Providence Athenæum, and of the American Ethnological Society; historian, archaeologist, and bibliographer; author of the well-known Dictionary of Americanisms.
- BOLLINGSOFF, Catherine, in religious vows, Mother Euphemia, in Emmitsburg, Md., March 13, 1887, aged about sixty-seven years; for many years teacher in St. Joseph's Academy, and superior of the Sisters of Charity in this country.
- BUCKHAM, the Rev. James, at Burlington, Vt., October 22, 1886, aged nearly ninety-two years; taught many years at Ellington, Conn., and elsewhere.
- CAMPBELL, John L., in Lexington, Va., February 2, 1886, aged sixty-six years; a notable chemist and geologist; professor of those branches in Washington and Lee University from 1851 till his death.
- CHAPIN, Mrs. Dorcas, at Springfield, Mass., November 14, 1886, aged eighty-five; a liberal giver in the cause of education, especially to the Springfield Public Library and to Amherst College.
- CHASE, Pliny Earle, at Haverford, Pa., December 17, 1886, aged sixty-six; professor in Haverford College, 1871-86; vice-president of the American Philosophical Society, etc.

- CLARK, William S., Ph. D., in Amherst, Mass., March 9, 1886, aged nearly sixty years; educated at Williston Seminary, Amherst College, and the University of Göttingen; professor of chemistry in Amherst College, 1852-67; president of the Massachusetts Agricultural College, 1867-79; in the service of the Japanese Government, organizing the Imperial College of Agriculture, 1876-77; member of the Massachusetts Board of Agriculture, 1859-61.
- CLEVELAND, the Rev. Edward, at Burlington, Kans., September 29, 1886, aged nearly eighty-two years; was a teacher and county superintendent of schools for eighteen years.
- CONWAY, Thomas W., in Brooklyn, April 6, 1887, aged forty-seven years; State superintendent of education in Louisiana, 1867-71.
- DALL, the Rev. Charles H. A., in Calcutta, India, July 18, 1886, aged seventy years; prominent in educational and missionary work for thirty years.
- DAVIS, Joseph A., M. D., in Bloomfield, N. J., August 4, 1886, aged seventy-three years; one of the early advocates and successful founders of public free schools in New Jersey.
- DE PAUW, Washington C., in Chicago, Ill., May 5, 1887, aged sixty-five years; the endower of De Pauw (formerly Indiana Asbury) University, at Greencastle, Ind., with more than \$2,000,000; of De Pauw College for young women, at New Albany; of a free industrial and charitable school and infirmary in the same town.
- DETWILLER, Henry, in Easton, Pa., April 21, 1887, aged ninety-one years; the father of American homeopathic medicine, and one of the founders of the American Institute of Homeopathy.
- DOTON, Hosea, in Woodstock, Vt., January 17, 1886, aged seventy-six years; for sixteen years a successful trainer of teachers, and a marked influence in the common schools of his State.
- DUDLEY, William H., M. D., in Brooklyn, N. Y., October 9, 1886, aged seventy-five years; one of the founders, and long a professor and president, of the Long Island Hospital and the medical college connected therewith.
- DULLES, the Rev. John W., in Philadelphia, April 13, 1887, aged sixty-three years; sometime secretary of the American Sunday School Union.
- ELIOT, William G., D. D., in Pass Christian, La., January 23, 1887, aged seventy-five years; president and chancellor of Washington University, St. Louis, Mo., from 1854 to 1886.
- FAIRBANKS, Thaddeus, in St. Johnsbury, Vt., April 12, 1886, aged ninety years; endower of St. Johnsbury Academy with \$200,000; famous as an inventor and manufacturer of lever-scales for weighing commodities, large and small.
- FEWSMITH, the Rev. Joseph, D. D., in Newark, N. J., June 22, 1887, aged seventy years; a director of the Union Theological Seminary in New York, and one of the founders of the German Theological School at Bloomfield.
- FORSYTH, the Rev. John, in Newburg, N. Y., October 17, 1886, aged seventy-six years; formerly professor in the theological seminary at New Brunswick, N. J., and chaplain and professor in the U. S. Military Academy at West Point, N. Y.
- GILLESPIE, Miss Elva ("Mother Angelica"), in South Bend, Ind., March 4, 1887; foundress of St. Mary's Academy in South Bend, and, as superior of the "Sisters of the Holy Cross" in this country, promoter and supervisor of many other female academies.
- GREEN, the Rt. Rev. William M., D. D., LL. D., bishop of Mississippi, in Sewanee, Tenn., February 13, 1887; professor of belles-lettres in the University of North Carolina, 1837-49; one of the founders and, since 1867, chancellor of the University of the South at Sewanee.
- GURNEX, Ephraim W., in Beverly, Mass., September 12, 1886, aged fifty-eight years; teacher in Boston, 1852-57; tutor and assistant professor in Harvard, 1857-61; professor of Latin, 1863; 1863-86 professor of history; dean of the college faculty, 1870-76; fellow of the Harvard corporation, 1884; sometime editor of the North American Review.
- HAMILTON, Frank H., M. D., LL. D., in New York City, August 11, 1886, aged seventy-three years; educated at Union College, the College of Physicians and Surgeons, Fairfield, N. Y., and the medical department of the University of Pennsylvania; professor of surgery at Fairfield, 1839, in Geneva Medical College, 1840, in Buffalo Medical College, 1846-58, and in Long Island College Hospital, 1858-61; professor of military surgery, fractures, dislocations, and chemical surgery in Bellevue Hospital Medical College, New York, 1861-68; and professor of general surgery in the same, 1868-75; author of a famous treatise on "Fractures and Dislocations," 1860, and several other surgical works; one of the consulting surgeons in the case of the late President Garfield.
- HARRINGTON, Calvin S., in Middletown, Conn., February 16, 1886, aged sixty years; for a quarter century professor of classic languages in Wesleyan University; editor of Plautus.

- HITCHCOCK**, the Rev. Roswell Dwight, D. D., LL. D., in Somerset, Mass., June 16, 1887; born in Maine August 15, 1817; educated at Amherst College, Andover Theological Seminary, and at Halle and Berlin Universities in Germany; professor in Bowdoin College, 1852-55; professor of church history, 1855, and president, 1880, of the Union Theological Seminary of the Presbyterian Church in New York; author of many works on theology, history, etc.
- HODGE**, the Rev. Archibald A., D. D., in Princeton, N. J., November 12, 1886, aged sixty-three years; professor of theology in the Western Theological Seminary of the Presbyterian Church in Allegheny, Pa., 1864-76, and at the Princeton Theological Seminary, 1876-86.
- HOOVER**, the Rev. Edward T., at West Salem, Wis., October 2, 1886, aged forty-nine years; for five years a teacher in Avery Institute, Charleston, S. C.
- HOPKINS**, Mark, M. D., D. D., LL. D., at Williamstown, Mass., June 17, 1887; born in Stockbridge, Mass., February 4, 1802; graduated at Williams College, 1824; professor of moral philosophy in that college, 1830-35; president, 1835-72; again professor, 1872 till his death; one of the ablest educators ever known; a profound metaphysician; author of many valuable treatises, and notably of "Moral Science," "The Law of Love and Love as a Law," and "Outline of the Study of Man." Of him it may be said with entire truth that he was, as a man, gentleman, and scholar, "totus, teres, atque rotundus."
- HUDSON**, E. D., M. D., in New York City, May 10, 1887, aged forty-four years; professor of medicine in the New York Polyclinic; author of a work on "Physical Diagnosis," etc.
- JEWELL**, James S., M. D., in Chicago, April 18, 1887, aged fifty years; professor of nervous and mental diseases in the Chicago Medical College, 1872-87; founder and editor of the "Journal of Nervous and Mental Diseases," etc.
- JEWITT**, the Rev. George B., D. D., at Salem, Mass., June 9, 1886, aged sixty-eight years; formerly tutor and professor in Amherst College; associated with Prof. J. H. Thayer in the preparation of the Lexicon of the Greek New Testament.
- KELOGG**, Albert, M. D., in Alameda, Cal., March 31, 1887, aged seventy-three years; famous as a botanist and botanical author; one of the founders of the California Academy of Sciences.
- LEA**, Isaac, in Philadelphia, Pa., December 9, 1886, aged ninety-four years; an eminent conchologist and mineralogist; president of the Philadelphia Academy of Natural Sciences, and vice-president of the American Philosophical Society.
- LEE**, the Rt. Rev. Alfred, D. D., LL. D., bishop of Delaware, in Wilmington, Del., April 12, 1887; an excellent classical scholar, and one of the American committee for the revision of the English version of the New Testament.
- LEWIS**, Dio, M. D., in Yonkers, N. Y., May 21, 1886, aged sixty-three years; inventor of the system of light gymnastics for schools, etc.
- LOTHROP**, the Rev. Samuel K., D. D., in Boston, Mass., June 12, 1886, aged eighty-two years, member of the Boston school committee for thirty years.
- MCLEAN**, the Rev. John, D. D., LL. D., in Princeton, N. J., August 10, 1886, aged eighty-six years; graduated from the College of New Jersey in 1816; tutor and professor in same 1816-54; president 1854-68; having served the corporation in various capacities with eminent ability for more than half a century.
- MAGOON**, the Rev. Elias L., D. D., in Philadelphia, November 25, 1886, aged seventy-six years; a generous benefactor of American colleges.
- MORRIS**, Charles D., LL. D., in Baltimore, February 7, 1886, aged fifty-six years; teacher and professor of classics in Peekskill, in New York City, and in Johns Hopkins University, Baltimore.
- MOULD**, Jacob W., in New York City, June 14, 1886, aged sixty-one years; landscape architect, employed in the Central Park, N. Y., 1857-74, to whom much of its charm is due.
- NEVIN**, the Rev. John W., D. D., in Lancaster, Pa., June 6, 1886, aged eighty-three years; president of Franklin and Marshall College, 1866-76; a theological controversialist of marked vigor and originality.
- NICHOLS**, Wm. R., in Hamburg, Germany, July 14, 1886, aged thirty-nine years; instructor and professor of chemistry in the Massachusetts Institute of Technology from 1869 till his death; author of several chemical text-books; well-known for his papers on water analysis, ventilation, etc.
- OLNEY**, Edward, LL. D., in Ann Arbor, Mich., January 16, 1887, aged nearly sixty years; a self-educated mathematician; teacher in public schools, 1846-53; professor of mathematics in Kalamazoo College, 1853-63, and in the University of Michigan till his death; author of an admirable series of school and college mathematical texts.
- PALMER**, the Rev. Ray, D. D., in Newark, N. J., March 29, 1887, aged seventy-eight years; one of the best of modern Protestant hymn writers; in early manhood a successful teacher.

- PERKINS, Charles C., in Windsor, Vt., August 25, 1886, aged sixty-three years; an eminent writer on art; one of the founders of the Massachusetts Normal Art School, etc.
- POTTER, the Rt. Rev. Horatio, D. D., LL. D., D. C. L., bishop of New York, January 2, 1887, aged nearly eighty-five years; professor in Trinity College, Connecticut, 1828-33; eminent in every good work during his long episcopate of more than thirty-four years.
- RICHARDSON, Edmund, in Jackson, Miss., January 11, 1886, aged sixty-seven years; promoter and liberal contributor to the success of the New Orleans Cotton Centennial Exhibition of 1883-84.
- RICHARDSON, Henry H., in Boston, Mass., April 27, 1886, aged forty-seven years; famous as the architect of Trinity P. E. Church in Boston; architect of Sever Hall and other buildings for Harvard University, the Crane Memorial Library, Quincy, Mass., etc.
- ROBERTSON, the Rt. Rev. Charles F., S. T. D., Bishop of Missouri, in St. Louis, May 1, 1886, aged fifty-one years; prominently identified with orphan and reformatory education.
- ROCHESTER, Thomas F., M. D., in Buffalo, N. Y., May 24, 1887, aged sixty-six years; professor of the practice of medicine in the medical department of the University of Buffalo, 1853-87.
- SEGHERS, the Most Rev. Charles J., archbishop of Oregon in 1880, and of Vancouver, 1884; born in Ghent, Belgium, 1839; murdered on the Yukon River, Alaska, November 28, 1886, while traveling to inspect Roman Catholic schools and missions in Alaska.
- SHANAHAN, the Rt. Rev. Jeremiah F., bishop of Harrisburg, September 24, 1886, aged fifty-two; organizer of many academies, parochial schools, and orphan asylums in his diocese.
- SHORT, Charles, LL. D., in New York City, December 24, 1886, aged sixty-five years; president of Kenyon College, Ohio, 1863-67; professor of Latin in Columbia College, N. Y., 1868-86; an admirable classical scholar; one of the authors of Harper's Latin Lexicon, etc.
- SILL, Edward R., A. M., in Cleveland, February 27, 1887, aged forty-six years; principal of the high school, Oakland, Cal., 1871-74; professor in the University of California, 1874-82; a poet and writer of rare quality and of great promise.
- SLOANE, the Rev. J. M. W., D. D., in Allegheny, Pa., March 5, 1886, aged sixty-three years; formerly president of Geneva College, N. Y., and more recently professor in the Theological Seminary of the Reformed Presbyterian Church in Allegheny.
- SMITH, Anson, D. D., in Cleveland, Ohio, May 2, 1887, aged seventy-five years; State commissioner of common schools in Ohio, 1856-62; city superintendent of public schools in Cleveland, 1862-66; for several years editor of the "Ohio Journal of Education."
- STEARNS, Eben S., in Nashville, Tenn., April 11, 1887, aged sixty-seven years; chancellor of the University of Nashville and president of its normal college, 1875-87.
- STEELE, J. Dorman, Ph. D., in Elmira, N. Y., May 25, 1886, aged fifty years; author of several text-books of great popularity on chemistry, geology, astronomy, etc.
- STOWE, the Rev. Calvin E., D. D., at Hartford, Conn., August 15, 1886, aged eighty-four. Born in South Natick, Mass., April 26, 1802; educated at Bowdoin College, 1824, and Andover Theological Seminary, 1828; instructor and professor in both, and in Dartmouth College and Lane Theological Seminary, 1828-64. Author of a famous report on elementary instruction in Prussia, published by the State of Ohio in 1833 and frequently reprinted. The really great abilities and solid labors of Dr. Stowe have been eclipsed by the genius of his more famous wife, Harriet Beecher Stowe.
- TAYLOR, William, in Middletown, N. Y., December 13, 1886, aged seventy-six years; for many years a school trustee in New York City; one of the founders of the New York Free Academy, now the College of the City of New York.
- TILDEN, Lucius L., at Nashua, N. H., November 4, 1886, aged eighty-four. Principal of a Ladies' Seminary at Middlebury, Vt., for many years.
- TILDEN, Samuel J., at Greystone-on-the-Hudson, N. Y., August 4, 1886, aged seventy-four years; eminent as a politician, lawyer, and statesman; overthrower of the "Tweed ring" in New York City, and of the "canal ring" in New York State; governor of New York, and the recipient of a popular majority of votes for the Presidency of the United States; his will left the bulk of his great fortune, estimated at \$5,000,000 to trustees, with a view to the establishment of a great free library in the city of New York.
- TUCKERMAN, Edward, LL. D., in New York City, March 15, 1886, aged sixty-nine years; from 1854 till his death an instructor and professor, first of history and afterwards of botany, in Amherst College; member of the American and National Academies of Science; author of several standard works on lichens, etc.

- TULANE**, Paul, in Princeton, N. J., March 27, 1887, aged eighty-six years; having accumulated a handsome fortune in his business in New Orleans, he munificently endowed Tulane University with more than \$2,000,000 during his life.
- VODGES**, William, in Philadelphia, January 29, 1886, aged eighty-four years; for twenty-four years professor of mathematics in the Philadelphia High School; author of excellent arithmetics, etc.
- WALTHER**, Carl F. W., D. D., in St. Louis, Mo., May 7, 1887, aged seventy-five years; professor in the Concordia Evangelical Lutheran College in St. Louis from 1849 till his death.
- WELSH**, John, LL. D., in Philadelphia, April 10, 1886, aged eighty years; trustee of the University of Pennsylvania for twenty years, and chairman of the finance committee of the Centennial Exhibition of 1876.
- WHITTLESEY**, Charles, in Cleveland, Ohio, October 18, 1886, aged seventy-eight years; widely known as a geologist and archaeologist; author of many valuable geological works, etc.; founder of the Western Reserve Historical Society; a colonel and military engineer in the Federal service during the civil war.
- WILDER**, Marshall P., in Boston, December 16, 1886, aged eighty-eight years; founder of the Massachusetts Agricultural College and the Massachusetts Board of Agriculture; an influential promoter of the Massachusetts Institute of Technology; widely known for his agricultural and horticultural labors and writings.
- WOLFE**, Miss Catharine L., in New York City, April 4, 1887, aged fifty-nine years; a munificent giver to educational, charitable, and religious objects; her gifts and bequests since 1872 amount to more than \$2,000,000.
- YOUMANS**, Edward L., M. D., in New York, January 18, 1887, aged sixty-five years; a self-educated scientist; author of a "Chemical Chart" and a "Class-Book of Chemistry" which have been widely used in schools; editor of the "Popular Science Monthly."

FOREIGN.

- AMOS**, Sheldon, at Alexandria, Egypt, January 2, 1886, aged forty-nine years; formerly professor of jurisprudence in University College, London; legal author of acknowledged soundness.
- BAYNE**, Herbert Andrew, in Picton, Canada, September 16, 1886, aged forty years; for more than twenty years prominent in secondary and higher science teaching in the Dominion.
- BAYNES**, Thomas S., in London, May 31, 1887, aged sixty-five years; formerly professor in the University of St. Andrews; editor of the ninth and latest edition of the *Encyclopedia Britannica*.
- BECKX**, Pierre Jean, in Rome, Italy, March 3, 1887, aged ninety-two years, general of the "Society of Jesus" from 1853 till his death.
- BÉCLARD**, Dr. Jules, in Paris, France, February 16, 1887, aged sixty-nine years; assistant professor, 1844, and professor, 1871, of physiology in the Paris Faculty of Medicine; author of a standard "Treatise on Human Physiology," etc.
- BERT**, Paul, in Tonquin, French Anam, November 11, 1886. Born in Auxerre, October 19, 1838; graduated in medicine at Paris in 1863; in 1866 became an assistant of Claude Bernard in the College de France; in 1867 professor of science at Bordeaux, and in 1869 at Paris in succession to his famous instructor; he made many important physiological researches for which he was rewarded by the prize of the Academy of Sciences. After the Franco-German war Professor Bert took an active part in the administration and legislation of the French Republic, becoming in 1874 an active advocate of the laws by which public primary instruction was made compulsory and entirely removed from the control of religious orders; in 1881 he was made minister of public instruction in the cabinet formed by M. Leon Gambetta. He was a voluminous writer on scientific subjects, especially on physiology.
- BORODIN**, Dr. Alexander P., in St. Petersburg, Russia, February 23, 1887, aged fifty-three years; professor of organic chemistry in the Military Medical College of St. Petersburg.
- BOUSSINGAULT**, Jean Baptiste, in Paris, France, May 12, 1837, aged eighty-five years; professor of chemistry at Lyons; of agriculture in Paris; author of many important works on those subjects.
- DUNCKER**, Maximilian Wolfgang, in Anspach, Germany, July 5, 1886, aged seventy-four years; a noted German writer on history, and professor of history in the university at Tübingen.
- FORSTER**, William E., in London, April 5, 1886, aged sixty-eight years; author of the English Education Act of 1870, and of other measures of educational reform.
- FOX**, Wilson, M. D., F. R. S., in London, England, May 3, 1887, aged fifty-six years; professor of pathological anatomy in University College, 1861, and of clinical medicine in the same, 1867.

- GOSSELIN, Dr. Leon, in Paris, France, April 29, 1887, aged seventy-one years; professor of surgical pathology, 1858, and of clinical surgery, 1867, in the Paris Faculty of Medicine; member of the French Academy of Sciences, etc.
- JACKSON, Thomas, in Sloke Newington, England, March 13, 1886; sometime editor of the London Journal of Education.
- JAMIN, Jules C., in Paris, February 12, 1886, aged sixty-six years; eminent as an investigator and professor of physics; member, 1863, and secretary, 1884, of the Academie des Sciences; a voluminous author in his specialties.
- MADVIG, Johann Nicolai, in Copenhagen, Denmark, December 12, 1886, aged eighty-two years; professor of Latin in the University, 1829; minister of worship, 1848, and director-general of public instruction, 1852; eminent as a philologist; author of a famous Latin grammar, etc.
- MORELEY, Samuel, in London, September 5, 1886, aged seventy-seven years; widely known as a liberal giver to public and private charities, and for his advocacy of measures for the improvement of the working people.
- NORTHCOTE, Sir Stafford, Earl of Iddesleigh, in London, January 12, 1887, aged seventy-eight years; honorably associated with the reform of the British civil service, with the joint high commission which made the treaty of Washington, etc.
- POTT, Friedrich August, in Halle, Germany, May 5, 1887, aged eighty-four years; for fifty-four years professor of comparative philology in the University of Halle, and author of many standard treatises on comparative etymology and phonology.
- SCHERER, Wilhelm, in Berlin, August 6, 1886, aged forty-five years; professor of philology in Vienna, Strasburg, and Berlin universities; a voluminous writer on German literature, etc.
- SCHMIDT, Wilhelm Adolph, in Jena, Germany, April 10, 1887, aged seventy-four years; professor of history at Berlin and at Jena; author of many important historical works.
- SCHRÖDER, Karl, in Berlin, February 7, 1887, aged forty-nine years; professor of surgery in the University of Berlin, and an eminent gynecologist.
- SMALL, John, LL. D., in Edinburgh, Scotland, August 20, 1886, aged sixty-four years; librarian of the university in that city from 1854; editor of ancient Scotch poetry, etc.
- STOCKHARDT, Julius, in Tharaud, Germany, June 1, 1886, aged seventy-seven years; professor of chemistry in the technical schools of Dresden and Tharaud since 1839; a voluminous writer on chemical and technical subjects.
- TREVELYAN, Sir Charles, Bart., in London, June 20, 1886, aged seventy-nine years; honorably associated with the establishment of superior schools in British India, competitive admission to the British civil service, etc.
- VON RANKE, Leopold, in Berlin, May 23, 1886, aged ninety-one years; eminent as a historian, and professor of history in Berlin University for nearly half a century.
- VULPIAN, Dr. Edouard, in Paris, France, May 18, 1887, aged sixty years; professor of physiology and dean of the Paris Faculty of Medicine, 1881; author of a classical work on "Diseases of the Nervous System," etc.
- ZUNZ, Leopold, in Berlin, March 19, 1886, aged ninety-two years; widely known as a Hebrew educator and author.

CHAPTER XVII.

EDUCATIONAL ASSOCIATIONS AND CONVENTIONS.

National Educational Association—Department of Superintendence of the National Educational Association—American Institute of Instruction—American Philological Association—American Association for the Advancement of Science—Modern Language Convention—Chautauqua Assemblies for 1887.

NATIONAL EDUCATIONAL ASSOCIATION.

The twenty-sixth annual meeting of the National Educational Association was held at Chicago, Ill., July 12-15, 1887. Speeches of welcome were made by Mayor Roche, of Chicago, George Howland, superintendent of schools in Chicago, and A. G. Lane, superintendent of schools in Cook County, to which President William E. Sheldon responded.

The introductory address was delivered by Richard Edwards, LL. D., superintendent of public instruction of Illinois. In discussing "The Problem of To-day" he stated that history shows that to every race and generation belongs some special work. The great problem of the latter decades of this century pertains to education, and upon the fraternity of teachers rests the responsibility of so moulding and strengthening the character of the men and women of this and coming generations that they shall not succumb to the unwonted strain of prosperity or be enfeebled by luxury and indulgence. The second session was devoted to the discussion of the "Psychological and Pedagogical Value of the Modern Methods of Elementary Culture." The following papers were presented: "The Socratic Method in Education," by Thomas Davidson, LL. D., of New Jersey; "The Objective Element," by Hon. J. W. Dickinson, of the board of education, Massachusetts; "The Philosophic and Scientific Element," by F. L. Soldan, St. Louis, Mo.; "The Natural and Developing Element," by W. N. Hailmann, La Porte, Ind., and by A. E. Winship, Boston, Mass. A treatise by Dr. James H. Hoose touched all the elements of the subject, and a paper prepared by Dr. W. T. Harris discussed the "Prescriptive and Assimilative Methods of Education." The examination question was treated by H. S. Tarbell, of Providence, R. I., John J. Tigert, Vanderbilt University, Nashville, Tenn., and George A. Littlefield, Newport, R. I. C. C. Rounds, principal of the State Normal School, Plymouth, N. H., presented a general discourse upon the topic of the session.

"The Ordinance of 1787" was the theme for consideration of the third session. The president made an introductory speech which he devoted principally to "The Educational Influence and Results of the Ordinance." "The Historical Bearings upon the Problems of Social and Political Life in the United States" were shown by I. W. Andrews, LL. D., of Marietta, Ohio; and J. L. Pickard, president of the State University, Iowa, analyzed "The Lessons Taught in Regard to the Future Educational Policy of our Government." B. A. Hinsdale, Cleveland, Ohio, mentioned "Some of the Indirect Educational Results of Opening the North-west Territory to Civilization."

"The Relation of the University, College, and Higher Technical Schools to the Public School System of Instruction," was the topic of the fourth session, and formed the subject of papers presented by J. B. Angell, president of Michigan University; Rev. J. W. Strong, president of Carleton College, Minn.; Rev. I. S. Hopkins, president of Emory College, Ga., and Prof. T. H. McBride, State University, Iowa. In the general discussion, remarks were made by a number of those present, and, in closing, Dr. J. B. Angell expressed his belief that both State and denominational universities should be maintained, and that all possible good must be extracted from both classes of institutions.

The dissertations presented at the fifth session had for their subject, "The Means and Ends of Culture to be Provided for the American People Beyond the Ordinary School Period." A. P. Marble, Worcester, Mass., described the value and sphere of evening schools; Dr. J. H. Vincent, Chautauqua, N. Y., spoke of the opportunities offered by reading circles; and General T. J. Morgan, principal of the State Normal

School, Rhode Island, showed the relations that should exist between the public school and the public library.

The sixth session was occupied in the discussion of "The Place Manual Training Should Occupy in a System of Public Schools," by General Francis A. Walker, president of Massachusetts Institute of Technology; M. A. Newell, State superintendent of schools, Maryland; and Miss L. A. Fay, superintendent of drawing, Springfield, Mass. The general debate was of more than usual interest.

The seventh and last session had for its topic, "What can be Done by Educators to Enlighten and Arouse the People, and Excite Public Sentiment in Favor of Education?" Mrs. Ella F. Young, Chicago, Ill., Prof. W. W. Parsons, principal of Normal College, Terre Haute, Ind., and Henry Sabin, Clinton, Iowa, presented papers.

During the meeting, resolutions were adopted recommending the more general study of physics, pointing out lines along which our school system should be developed, commending the National Bureau of Education, reaffirming the conviction of the necessity of temporary Federal aid in the education of the illiterate masses of the South, expressing interest in the education of the Indians, etc.

The *National Council of Education* was called to order at Chicago, Ill., July 7, 1887, by the president, Daniel B. Hagar. After the reading of a communication from Dr. W. T. Harris on the "Function of the Public School," and the report of the committee on pedagogics on the same subject, several members participated in the discussion of the question under consideration.

The report of the committee on secondary education on the "Relation of High Schools to Colleges," was received and discussed at the second session. Other reports were rendered as follows: by the committee on normal education, subject, "Teachers' Institutes;" by the committee on hygiene in education, subject, "Relation of Mental Labor to Physical Health;" by the committee on State school systems, subject, "Teachers' Tenure of Office;" by the committee on educational statistics, subject, "Points for Consideration in the Statistics of Education." All these reports were fully discussed by the members present. A paper was presented by J. M. Greenwood on "What Teachers Read," in lieu of a report by the committee on educational literature. Upon the invitation of the council, Mr. Poole, librarian of the public library of Chicago, delivered an address on the use of the public library by the teachers and pupils in the public schools.

The *Kindergarten Department* was opened by President W. N. Hailmann with an address upon the application of the kindergarten idea, its objections and merits. Miss Kate L. Brown, of Massachusetts, described the steps necessary for the "Application of Froebel's Principles in the Primary Schools;" Mrs. Clara A. Barr, of New York, read a paper upon the "Value of Kindergarten Training in Normal Schools;" and Miss Eleanor Beebe, of Kentucky, showed the "Value of the Kindergarten in the Education of the Blind."

The *Department of Elementary Schools*, over which W. H. Bartholomew presided, considered at its first session a paper by Mrs. N. S. Williams, of Kentucky, on the "Union of Oral and Book Teaching in the Several Grades." "The Meaning and Limitation of the Maxim, 'We Learn to Do by Doing,' in Elementary Schools," was treated by Dr. N. C. Shaeffer, of Pennsylvania. F. W. Parker, of Illinois, discussed the paper in a general way, and was followed by Prof. George E. Little, of Washington, D. C., who spoke on the "Value of Illustrative Teaching." "The Importance of Religious Motives and Sanctions in Moral Training" was the subject of a paper read by Dr. Robert Allyn, of Illinois.

The *Department of Secondary Education* was called to order by Vice-President H. L. Boltwood. Papers were read by A. F. Nightingale on "A Plea for the Classics;" by Miss G. Clark on "Some Thoughts on English." These papers provoked an animated discussion resulting in the adoption of a resolution, "That in the opinion of this department, the English language should be given at least an equal place with that of the classics and science in high school courses of study." The paper read by Samuel Thurber, of Massachusetts, on the "Order and Relation of Studies in the High School Course," also gave rise to a long and interesting discussion, at the close of which a resolution was adopted requesting a committee to report at the next annual meeting of the department a general course of study, calculated to express the complete function of the high school.

The *Department of Higher Education* was under the presidency of Dr. W. A. Mowry, of Massachusetts. The paper read by H. B. Sprague, of California, on the "Place of Literature in the College Course," gave rise to considerable discussion, in which President Andrews, of Marietta College, Ohio, Prof. C. H. Ford, Dr. H. A. Thompson, and Dr. Jerome Allen participated.

The *Normal Department* was called to order by President A. R. Taylor. Papers were read as follows: by T. J. Gray, of Minnesota, on "Methods of Instruction in Use in the Normal Schools of the United States;" by Charles De Garmo, of Illinois, on the "Normal School System of Germany;" by G. S. Albee, of Wisconsin, on "Psychology in

Normal Schools." J. A. Barnard, Dr. J. H. Hoose, George P. Brown, S. S. Parr, and others took part in the discussion of the first-named paper.

The *Department of Superintendence* was presided over by Charles S. Young. The theme of the first paper, that read by John Hancock, of Ohio, was "School Supervision in the United States and Other States Compared." J. W. Akers, of Iowa, and Solomon Palmer, of Alabama, took part in the discussion. The paper by N. C. Dougherty on "The Superintendent and Good Literature in the Schools" was discussed by Messrs. Richardson, Strauss, Hoitt, Colston, Wolf, and Mrs. Rickoff.

The *Department of Industrial Education* was opened by a speech from the president, Prof. J. M. Ordway, of Louisiana, in which he reviewed the progress of manual training, and expressed his hopes of its future as an educational force. The subject, "In Schools of What Grade may Manual Training be most Properly Introduced?" was discussed by Prof. Z. Richards, Professor Woodward, H. M. Leipziger, and Professor Miller. "Can the Teaching of Needlework in Girls' Schools be Advocated on Pedagogic and Sanitary Grounds?" was answered in the affirmative by the president of the department, Mrs. Nellie S. Kedzie, Professor Potts, Professor Hatch, Prof. J. D. Walters, and Professor Rickoff, each of whom made a few practical remarks that were listened to with interest. Professor Murch opposed the introduction of manual work in the public schools, and Professor Brown spoke of the danger attending a sudden and radical change from the purely intellectual to the extremely practical in instruction.

The *Department of Art Education* was called to order by the president, W. S. Perry, who made a short talk, confining his remarks principally to the importance of drawing. A paper prepared by Mrs. E. F. Dimock on "Drawing in Primary and Grammar Schools" was read by Mrs. Ella F. Young. An exercise in clay modelling was given by a class of young children under the direction of Miss Jennie McWhorter. "Drawing in Ungraded or Village Schools" was treated by W. S. Goodnough and Miss E. A. Hills. Papers were also read on "Drawing in the High Schools," by C. N. Harrison and W. S. Perry; "Drawing in Normal Schools," by Miss M. L. Field and Miss Harriet C. Magee.

In the *Department of Music* the president, Oliver S. Westcott, delivered the opening address, taking as his theme, "What Has Been Done in the Public Schools for and with Vocal Music?" The following subjects were also treated: "Shall the State Teach Music?" by T. J. Morgan; "Vocal Training and Singing," by Frederick W. Root; "The Educational Value of the Tonic Sol-Fa System," by Daniel Batchellor; "Fervent Voice—its Nature and Reflex Influence," by William L. Tomlins.

THE DEPARTMENT OF SUPERINTENDENCE OF THE NATIONAL EDUCATIONAL ASSOCIATION.

The winter session of this department was held in Washington, D. C., March 15-17, 1887, Charles S. Young, of Nevada, presiding. The first address made was that of Hon. N. H. R. Dawson, United States Commissioner of Education, who described the objects and methods of the Bureau under his charge. F. M. Campbell then described at length "Public Education on the Pacific Coast." Dr. A. J. Rickoff discoursed upon "A Teacher's Certificate—County, City, State, and National;" and Hon. L. D. Brown spoke on "Civil Service and Public Schools," which subject was also discussed by B. S. Morgan, W. N. Barringer, T. P. Ballard, G. J. Luckey, and H. R. Waite. A. P. Marble read a paper entitled "Powers and Duties of School Officers and Teachers, Absolute and Relative." E. E. Higbee treated "City and County Supervision," and was followed by W. E. Comings, H. S. Jones, W. H. Bartholomew, F. W. Parker, A. G. Lane and others, who discussed the same subject. F. W. Parker, in the absence of James MacAlister, made an impromptu address on "Industrial Education in the Public Schools." J. W. Dickinson and W. B. Powell spoke upon the same theme. H. W. Compton told "What a Small City (Toledo, Ohio) is Doing in Industrial Training," and Maj. R. Bingham spoke of the need of such training in the South. J. W. Holcombe, of Indiana, presented a paper suggesting a "System of Grading for Country Schools," which was discussed by D. B. Johnson, H. C. Speer, John MacDonald, and others. Warren Easton's paper, "The Best System of State School Supervision," was then read, and discussed by Richard Edwards, Solomon Palmer, John L. Buchanan, J. W. Holcombe, and others. Fred. M. Campbell resumed his description of the status of educational matters in California, referring particularly to the recent amendment of the State's constitution in regard to textbooks. "The Relation of our Public Schools to the General Government" was analyzed by United States Senators Blair and Stewart, and Dr. M. A. Newell. Sheldon Jackson spoke of "Education in Alaska."

AMERICAN INSTITUTE OF INSTRUCTION.

This association held its fiftieth-eighth annual meeting at Burlington, Vt., July 5-8, 1887; J. Milton Hall, of Rhode Island, in the chair. The first topic discussed was

"The Township *versus* the District System of Schools," the principal paper being read by W. E. Howard. The president delivered an address presenting a general view of the state of education. He advocated compulsory education, opposed industrial training as a part of public school instruction, commented upon the improved methods of teaching English, and recommended the publication by a national commission of an authoritative, standard dictionary. Following this address came a paper on the "Professional Training of Teachers," by A. W. Edson, of Jersey City, N. J. "Ungraded Schools" were described by G. S. Aldrich, of Massachusetts; and the "Feelings and their Culture" were effectively presented by T. M. Balliet, of Pennsylvania. "The Extra-Professional Duties and Privileges of the Teacher," was the subject of an essay presented by John O. Norris, of Massachusetts. "Individualism in Teaching," was treated by J. C. Greenough; "The Literature of our Boys and Girls," by J. M. Sawin, of Providence; "Free Text-books," by Thomas Emerson; "Elements of a Liberal Education," by W. I. Scott; the "School and the Citizen," by A. M. Edwards.

Resolutions were passed urging the substitution of the township system for the district system, recommending the adoption of the free text-book system, and favoring national aid to education.

THE AMERICAN PHILOLOGICAL ASSOCIATION.

The eighteenth annual session was called to order at Ithaca, N. Y., July 13, 1886, by the president, Prof. Tracy Peck, of Yale College. The following were the titles of the communications read, with the names of their authors:

- (1) "Hebrew Words in the Latin Glossary, Codex Sangallensis, 912," by Cyrus Adler, of Johns Hopkins University, Baltimore, Md.
- (2) "The Birds of Aristophanes: a Theory of Interpretation," by Prof. W. S. Scarborough, of Wilberforce University, Wilberforce, Ohio.
- (3) "The Word *Election* in American Politics," by Prof. Fisk P. Brewer, of Grinnell, Iowa.
- (4) "Contributions to the Grammar of the Cypriote Inscriptions," by Prof. Isaac H. Hall, of the Metropolitan Museum, New York, N. Y.
- (5) "Ashtôreth, the Canaanitish Goddess; a New Etymology Proposed," by Prof. James S. Blackwell, of the University of Missouri, Columbia, Mo.
- (6) "The Sources of Seneca's *De Beneficiis*," by Harold N. Fowler, Ph. D., of Harvard University, Cambridge, Mass.
- (7) "The Vowels *o* and *u* in English," by Benjamin W. Wells, Ph. D., of the Friends' School, Providence, R. I.
- (8) "A Translation of the Katha Upanishad," by Prof. William D. Whitney, of Yale College, New Haven, Conn.
- (9) "Provincialisms of the 'Dutch' Districts of Pennsylvania," by Lee L. Grumbine, Esq., of Lebanon, Pa.
- (10) "Notes on Homeric Zoölogy," by Julius Sachs, Ph. D., of New York, N. Y.
- (11) "The Inter-relations of the Dialects of Northern Greece," by Herbert Weir Smyth, Ph. D., of Johns Hopkins University, Baltimore, Md.
- (12) "Assyrian, in its Relation to Hebrew and Arabic," by Prof. Morris Jastrow, Jr., of the University of Pennsylvania, Philadelphia.
- (13) "Roots," by Prof. William D. Whitney, of Yale College.
- (14) "Analogy, and the Scope of its Application in Language," by Prof. B. I. Wheeler, of Cornell University.
- (15) "Southernisms," by Prof. Charles Forster Smith, Vanderbilt University, Nashville, Tenn.
- (16) "The Dative Case in Sophokles," by Arthur Fairbanks, of Dartmouth College, Hanover, N. H.
- (17) "The Sequences of Tenses in Latin," by Prof. William Gardner Hale, of Cornell University, Ithaca, N. Y.
- (18) "The Survival of Gender in *this* and *that*," by Prof. Lemuel S. Potwin, of Adelbert College, Cleveland, Ohio.
- (19) "Once-used Words in Shakespeare," by Prof. F. A. March, of Lafayette College, Easton, Pa.
- (20) "Consonant Notation and Vowel Definition," by Prof. Francis A. March, of Lafayette College, Easton, Pa.
- (21) "The Authorship of the Epistle to the Hebrews," by Rev. Dr. C. K. Nelson, of Brookeville Academy, Brookeville, Md.
- (22) "The Derivation of 'Meridie,'" by Prof. Minton Warren, of Johns Hopkins University, Baltimore, Md.
- (23) "Phonetic Law," by Prof. F. B. Tarbell, of Yale College, New Haven, Conn.
- (24) "The Method of Phonetic Change in Language," by Prof. William D. Whitney, Yale College, New Haven, Conn.
- (25) "Horace *vs.* his Scholiast (*De Arte Poet.*, 175, 176)," by Prof. Lemuel S. Potwin, Adelbert College, Cleveland, Ohio.
- (26) "Munda," by Prof. William I. Knapp, of Yale College, New Haven, Conn.
- (27) "Aristophanes and Low Comedy," by Alfred Emerson, Ph. D., of Milford, Nebr.

THE AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

The thirty-sixth annual meeting was held at New York City, August 10-13, 1887, Prof. S. P. Langley, presiding. The association is divided into eight sections, and before each of these there were read a number of papers upon various topics relating to that particular branch of science to whose investigation the section is devoted. The following were among the subjects treated:

In Section A (mathematics and astronomy), "A Method of Computing the Secular Contraction of the Earth," by R. S. Woodward; "A Completed Nomenclature for the

Principal Roulettes," by F. N. Willson; "The Phenomena of Solar Vortices," by Frank H. Bigelow.

In Section B (physics), "Measurement of Surface Tension of Liquids," by W. F. Magie; "A Method of Telephonic Communication between Ships at Sea," by L. I. Blake; "On the Pyromagnetic Dynamo—a Machine for Producing Electricity Directly from Fuel," by Thomas A. Edison.

In Section C (chemistry), "Percentage of Ash in Human Bones of Different Ages," by W. P. Mason; "Amount of Moisture Left in a Gas after Drying by Phosphorus Pentoxide," by E. W. Morley; "Some Higher Homologues of Cocaine," by F. G. Novy; "On the Occurrence in Nature of a Copper Antimonide," by T. H. Norton.

In Section D (mechanical science and engineering), "The American System of Water Purification," by A. R. Leeds; "On the Deflection of Girders and Trusses," by H. T. Eddy; "On the Uniformity of Planimeter Measurements," by T. C. Mendenhall and John Mack.

In Section E (geology and geography), "On the Different Types of the Devonian in North America," by H. S. Williams; "The Upper Hamilton of Chenango and Otsego Counties, New York," by Charles S. Prosser; "Discovery of Fossils in the Lower Taconic of Emmons," by C. D. Walcott.

In Section F (biology), "Evidence Confirmatory of *Mastodon Obscurus* Leidy, as an American Species," by R. P. Whitfield; "The Pineal Eye in Extinct Vertebrata," by E. D. Cope; "Origin of American Carnivora," by W. B. Scott; "On the Phengodini and their Luminous Larviform Females," by C. V. Riley.

In Section H (anthropology), "Illustrative Notes Concerning the Minnesota Odjibwas," by F. E. Babbitt; "Aboriginal Dwelling-Sites in the Champlain Valley," by D. S. Kellogg; "Sensory Types of Memory and Apperception," by Joseph Jastrow; "The True Basis of Ethnology," by Horatio Hale.

In Section I (economic science and statistics), "Physiological and Pecuniary Economy of Food," by W. O. Atwater; "Food of Working Men and its Relation to the Work Done," by W. O. Atwater; "The Science of Civics," by H. R. Waite; "On the Rates of Interest Realized to Investors in the Bonded Securities of the United States Government," by E. B. Elliott.

MODERN LANGUAGE CONVENTION.

This convention was held in Baltimore, Md., during the latter part of December, 1886. Among the papers read were the following: "Recent Educational Movements in their Relation to Language," by Professor Painter, of Roanoke College, Va.; "The Courses in English and its Value as a Discipline," by Professor Garnett, of the University of Virginia; and "Poetry in the Chronicle of Limburg," by Dr. Goebel, of Johns Hopkins University. Philadelphia was selected as the next place of meeting, and James Russell Lowell, of Harvard, was elected president.

THE CHAUTAUQUA ASSEMBLIES FOR 1887.

Chautauqua, N. Y.—July 2–August 23.—In the summer assemblies, Chautauqua, "Mother of Assemblies," is placed first, as the model upon which the long train of followers have been formed. The plan for the summer session was full of life and vigor, as well as novelty and popularity, and these qualities were expressed by new features and by a refining and crystallization of those already introduced. The programme was skilfully and wisely arranged with regard to the taste of the constituency upon which it must depend for support. The speakers were carefully selected out of the multitude, the timeliness of every subject weighed, popular and technical lectures were grouped with due consideration for the needs of students and people, and the platform exercises were invariably made to harmonize with the current specialty.

The meetings of the fourteenth Chautauqua Assembly may be divided into the Popular Programme, the work of the Chautauqua Literary and Scientific Circle ("C. L. S. C."), Church Congress, Summer Session of the College of Liberal Arts, Summer Classes, Teachers' Retreat, Institute of Music, Missionary Institute, Assembly, and After-week. The special departments have crystallized into more refined, clear, and permanent shapes than ever before. A classification of the subjects discussed by the various speakers includes literature, language, science, theology, history, religion, political economy, social science, law, and travel, with the addition of a large amount of miscellaneous matter, such as concerts, classic organ recitals, and entertainments.

The sessions of the schools and summer classes were largely attended. Some 60 teachers were present at the three weeks' session of the Retreat, and 800 students were enrolled in all the various departments of the Chautauqua College of Liberal Arts. The launching of the college was an event of more than usual importance in

the history of Chautauqua. Dr. W. R. Harper, of Yale University, supported by some 35 instructors representing at least 20 different universities and colleges, conducted the six weeks' session. Personal instruction was given in modern, classical, and oriental languages, mathematics, science, history, and philosophy, and all studies common to a university curriculum. Certain series of the lectures were of great practical benefit, such as Professor Ely's series on social science, the law lectures of Judge Tourgée, the memory lessons of Professor Loissette, and the psychological studies under Professor Davis. The number of students present was about double that of any session of the schools of language. Representatives came from almost every State and Territory in the Union, as well as from Canada, Germany, Japan, and Syria. Examinations were given all who desired them, and certificates were awarded for the work done. These certificates will have the same value as those covering the same amount of work in any college of the country. So satisfactory did the experiment prove, that Professor Harper announces that the same policy is to be pursued another year, and the same faculty engaged, the only change being additions to certain departments.

The Institute of Music made the most ambitious and thoroughly systematized effort to teach instrumental and vocal music yet attempted at Chautauqua. The specially new feature of the season was the department of public school music, in which the methods of the National Normal Music School of Boston were taught by a faculty, including the president and secretary of this school, and the supervisor of music in the public schools of Washington.

The Normal Union, inaugurated last year for the purpose of systematizing and strengthening the normal work of the assembly, has met with hearty favor, and more than twenty assemblies are reported to have adopted the scheme. During the past winter many large classes were formed in various places, about 450 persons taking the course at Chautauqua in August.

The Chautauqua Literary and Scientific Circle did persistent and valuable work throughout the entire session. The Round Tables attained an unusual degree of popularity even among many who were not members of the Circle, which was due to no special elocution or learning displayed in the gatherings, but rather to the spirit and aim which characterized them. On Recognition Day, 687 members of the "C. L. S. C." Class of 1887 received their diplomas. This class will graduate 5,000 members, a larger proportion of its first enrolment than that of 1886, which was fully one-fourth.

The lecturers and instructors at the assembly included some of the foremost educators and men of the day. Among the new speakers were Rev. Mark Guy Pearse, of England; Prof. Henry Drummond, of Glasgow; Dr. and Mrs. S. L. Baldwin; Dr. J. A. Broadus; the Rev. Emory J. Haynes; Dr. C. R. Henderson; the Rev. W. H. Ingersoll; the Rev. G. W. Miller; Prof. R. E. Thompson; Dr. O. W. Warren; Dr. N. West; Prof. W. C. Richards, and Mrs. Mary T. Lathrop, besides the large number of superior lecturers drawn from the faculty of the College of Liberal Arts.

Many improvements in the grounds and buildings are reported, among which may be mentioned a large and handsome Union Class building, and a magnificent new building for the College of Liberal Arts. These signs indicate the permanency of the Chautauqua growth, and the value and appreciation of the Chautauqua idea. An institution which can continue to increase for fourteen years in ambitions, breadth, scholarship, and appliances, has the very best elements of endurance.

Following the general model of the Chautauqua Assembly, similar ones were held throughout the country, the places and dates of which are herewith given:

Canada. Niagara-on-the-Lake, Ontario, July 23 to August 1.

California. Long Beach, Southern California, July 20 to August 7. Monterey, July 5 to 15.

Colorado. Glen Park, July 4 to 14.

Connecticut. Northampton, July 26 to 29.

Illinois. Lake Bluff, July 23 to August 9.

Indiana. Acton Park, July 27 to August 17. Island Park, July 26 to August 8.

Iowa. Bluff Park, July 19 to 29.

Kansas. Ottawa, June 15 to 29. Topeka, July 19 to 23. Winfield, June 7 to 18.

Kentucky. Lexington, June 23 to July 8.

Maine. Fryeburg, July 21 to August 3. Lake Grove, July 1 to —. Old Orchard, —.

Maryland. Mountain Lake Park, August 2 to 12.

Massachusetts. South Framingham, July 12 to August 23.

Michigan. Bay View, July 27 to August 11.

Minnesota. Mahtomedi, July 21 to 30. Waseca, July 5 to 22.

Missouri. Warrensburg, July 27 to August 5.

Nebraska. Crete, June 29 to July 9.

New Hampshire. East Epping, August 15 to 20. Weirs, July 12 to 22.

New Jersey. Island Heights, July 23 to August 1. Seaside, Key East, August 1 to 14. Ocean Grove, July 9 to 20.

New York. Round Lake, July 20 to August 5. Silver Lake, —.

Ohio. Concord, August 29 to September 3. Lake Side, July 19 to August 1.

Oregon. Canby, July 12 to 20.

Pennsylvania. Mountain Grove, —. Williams Grove, —.

Tennessee. Monteagle, July 6 to September 7.

Texas. San Marcos, August —.

Wisconsin. Monona Lake, July 26 to August 5.

Washington Territory. Puget Sound, July 18 to 29.

The third annual assembly of the Florida Chautauqua, at De Funiak Springs, was held February 17 to March 31, 1887.

CHAPTER XVIII.

LIBRARIES IN THE UNITED STATES.

Former library tables—Classification adopted in the present Report—Free lending libraries, supported wholly or partly by public moneys (Table 96)—Free reference libraries, supported wholly or partly by public moneys (Table 97)—Libraries attached to public school systems (Table 98)—Free lending libraries, owned and supported by corporations (Table 99)—Libraries belonging to societies, associations, lodges, clubs, etc. (Table 100)—Lending libraries owned by corporations (Table 101)—Circulating libraries which are business investments and are conducted for profit (Table 102).

This Bureau has steadfastly emphasized the importance of libraries as instrumentalities of culture and instruction. The first Annual Report of Mr. Commissioner Eaton (for 1870) contained a list of 161 "principal libraries" in this country. These did not include libraries attached to or forming part of schools and colleges. The Report for 1872 contained a list of 1,050 libraries containing 1,000 or more volumes, in which all libraries, not private, then known to the Office were included. In 1875 and 1876 the massive Special Report on Public Libraries, in two parts, appeared. This document contained a table of 3,647 libraries of 300 or more volumes. This table was also published in the Annual Report for 1875. A similar table, containing 5,338 such libraries, appeared in the Annual Report for 1884-85.

The other Annual Reports contained additional information as yearly gathered, but not to an extent making special description desirable.

The systematic attempt made in every part of the present document to classify and simplify the statistics of education to be reported, has been extended to those relating to libraries. After consultation with several librarians of exceptional experience and undoubted judgment, the following basic conclusions were formed:

(1) That all libraries connected with colleges, schools, or school systems, mentioned in other parts of the Report, be omitted.

(2) That only such other public libraries as contained one thousand or more volumes be retained as material for this document.

(3) That these be classified in accordance with their ownership, the conditions imposed for their use, and like simple standards of discrimination.

It is obvious, therefore, that the lists presented in this chapter can not be compared with those published heretofore by this Bureau. The seven tables of detailed statistics presented in this chapter give information respecting 1,779 libraries, which contained 14,012,370 volumes.

These are properly libraries, or such an integral part of the corporations with which they are associated as to justify their presence in these tables.

The first factor used in classifying these libraries was their financial relation to the public. The question—Is the library supported wholly or partly by public moneys?—divided all into two general classes, those so supported and those otherwise maintained.

The libraries here reported which were wholly or partly supported by public moneys numbered 670, and contained 6,963,850 volumes. The libraries otherwise maintained numbered 1,109, and contained 7,048,520 volumes.

Almost without exception, libraries maintained wholly or partly by public moneys are free for public use. Libraries otherwise maintained are divisible on this point, 863 of them requiring membership fees, annual subscriptions, or payment for each book read. These libraries contained 5,320,750 volumes.

It follows that the other 911 libraries, with their 8,691,620 volumes, were "free" libraries.

An inquiry as to whether a library was mainly for reference or was a lending library produced a subdivision in the public libraries; and the question whether a public library was mainly for the use of the public schools surrounding it, produced a third class.

The character of the ownership and nature of the use of libraries otherwise maintained divided them into four classes.

The tables of detailed statistics are thus seven in number. Every care has been taken to assign each library to its appropriate class; probably many errors in classification have been made from lack of knowledge in individual cases, especially

when it was necessary to decide whether a library belonging to a society, association, or other corporation, was or was not a lending library. The result, confessedly imperfect, is submitted for the use and judgment of educationists and librarians.

The word "library" is omitted wherever practicable from the columns entitled "name of library," in order to avoid its wearisome repetition hundreds of times, and also in order to give room for the columns respecting "increase" and "income," now presented as compactly as the facts permit.

The table of free public school libraries (Table 98) does not include any libraries connected with public school systems mentioned in Chapter IV of this Report. The libraries here set forth are additional to those in that chapter. It follows that Table 98 is not to be understood as a complete exhibit of all public school libraries. Respecting these, indeed, a complete or satisfactory statement is at present impossible.

In addition to the libraries containing one thousand or more volumes, this Bureau possesses new statistics of nearly two thousand libraries having three hundred or more volumes. These are excluded from this chapter for imperative reasons relating to size, importance, time, etc. If circumstances are favorable, these statistics may appear in one of the minor publications of this Bureau for the year 1888.

The number of libraries and of volumes in each of the seven classes considered in this chapter are as follows:

	Libraries.	Volumes.
Free public lending libraries	424	3,721,191
Free public reference libraries	153	3,075,099
Free public school libraries	93	177,560
Free corporate lending libraries	241	1,727,870
Libraries of clubs, associations, etc	341	2,460,334
Subscription corporate libraries	452	2,644,929
Circulating libraries proper	75	215,487

FREE PUBLIC LENDING LIBRARIES.

[Tables 97 and 98.]

The first group to be more particularly considered is composed of those libraries supported wholly or in part by public grants, taxes, or endowments, and having free circulation of their contents among the citizens of the places where they are situated.

Practically these libraries are confined to the northern parts of the Union, where the population is collected in villages, towns, and cities, and where the surplus of public moneys permits this expenditure. The public free lending library can not exist and prosper in a rural community, or among people whose wealth is not collectively considerable. It is, therefore, not wonderful that Massachusetts, one of the wealthiest and most thickly populated of America's commonwealths, should have many more of these libraries than any other of the States. The public education that begins with the elementary school, here culminates in the free library.

By the law of this State any town may grant the proceeds of the "dog-tax" to a free library within its borders. Several other States have good laws for the encouragement of free public libraries. The great State of New York, after lavish expenditures of money for district libraries, and after several experiments, has recently passed a law of this kind, of which the following paragraph is a synopsis:¹

Any duly incorporated library association owning real estate worth \$20,000 and a library of 10,000 volumes, which maintains the same as a free lending library, is authorized to apply to the common council or other proper authority in its city for an appropriation based upon the circulation of its books during the twelve months preceding such application. If the circulation has been 75,000 volumes, it may apply for \$5,000, and \$5,000 more for each addition of 100,000 to the circulation; the term circulation being defined to mean the aggregate number of volumes withdrawn from the library by readers for use in their homes or places of business. In the city of New York no library may receive more than \$40,000 annually for such circulation.

It is a fact to be observed and lamented that the District of Columbia, the seat of National Government, does not have a single library of this description. Outside the Executive Departments, the people of the capital have no opportunity for the perusal of books at their homes except at their own cost. It is believed that no other city of importance in the country is so lacking in this means of public culture, pleasure, and profit.

¹ Laws of New York, Chap. 666, of 1886.

One of the oldest libraries in this group is the Franklin Library, in Franklin, Mass. This town, named in honor of the famous printer-philosopher, received from him in 1786 a gift of 100 volumes for a town library. The selectmen had suggested that a bell would be an acceptable recognition of the honor conferred, but the sagacious old man replied that he preferred sense to sound, and the books were accepted. More than half of them are still in the possession of the library and are cherished as a relic of their donor.²

TABLE 97.—Summary, by States and geographical divisions, of free lending libraries supported wholly or partly by public moneys.

FREE PUBLIC REFERENCE LIBRARIES.

[Tables 99 and 100.]

In addition to the public lending libraries already mentioned, public moneys are granted in support of many libraries essential or useful to the service of the States, Territories, courts, and cities of the country. These are usually reference libraries; i. e., their purpose is mainly that of consultation in the library. The contents are chiefly documentary, historical, scientific, or legal.

Every State and Territory, except Utah, reports at least one such collection. The presence of the Federal Government, with its Executive Departments, its Legislature, its Supreme Court, its National Museum, and other appliances, endows the District of Columbia with nearly one-third of these libraries and with more than one-third of their contents; among these, the Library of Congress stands first in size, value of contents, and potential usefulness.

The entire lack of public free-lending libraries in the District of Columbia is to some extent made up by the privilege of drawing books from the libraries of the Executive Departments enjoyed by the employes thereof. The value of these Department libraries varies, naturally, with the character of their contents and the facilities existing for their use. Mrs. Helen L. McL. Kimball, librarian of the Treasury Department, thus describes the way in which the collection under her charge is made to serve the public:

"Until 1875 this library was considered only a reference library, and formed part of the Division of Records and Files in the Secretary's office. The library now has two divisions, the circulating and the reference. The hours for giving out books to readers are 8 to 9 A. M., 12 to 12.30 P. M., and 4 to 5 P. M. Our greatest usefulness to others than officials is to the children in the schools, whose parents or friends use the library for their benefit, and our best work, perhaps, is in this direction."

a For 1886.

PUBLIC SCHOOL LIBRARIES.

[Tables 101 and 102.]

The remarks already made respecting the group of public school libraries presented in this chapter should be kept in mind. The table here given does not pretend to include all the libraries of its class; most of them are excluded by their small size; many by the fact that they are included with other statistics in the tables in a previous part of this Report; some will be found in the first table (Table 98) of this chapter, because they are free lending as well as free school libraries. After these important deductions are made, the remaining libraries are tabulated in this group.

Among public school library laws, that of California, briefly summarized in the Report of this Bureau for 1885-86, seems to be one of the simplest and most efficacious. A copy of the label used to designate the books in the school libraries of this State is here given.

PUBLIC SCHOOL LIBRARY,

STATE OF CALIFORNIA,

School District.

RULES AND REGULATIONS.

1. The Librarian appointed by the Trustees shall properly label and number each book in the District Library, and keep a catalogue of the same, showing the title and number of each book.

2. The Library shall be open for drawing and returning books every.....between the hours of.....

3. Every child attending school shall be entitled to the privileges of the Library; but when the number of books is insufficient to supply all the pupils, the Librarian shall determine the manner in which books may be drawn.

4. No person shall be entitled to two books from the Library at the same time, and no family shall draw more than one book while other families wishing books remain unsupplied.

5. No person shall loan a Library book to any one out of his own house, under a penalty of fifty cents for each offense.

6. No person shall retain a book from the Library more than two weeks, under a penalty of ten cents for each day he may so retain it; and no person may draw the same book the second time, while any other person wishes to draw it.

7. Any person losing or destroying a Library book shall pay the cost of such book and a fine of fifty cents; and any person injuring a book by marking, tearing, or unnecessarily soiling it, shall be liable to a fine of not less than ten cents nor more than the cost of the book, to be determined by the Librarian.

8. Any person refusing or neglecting to pay any penalty or fine shall not be allowed to draw any book from the Library.

9. Any person, other than pupils attending, resident in the school district, may become entitled to the privileges of the School Library by the payment of an admission fee of one dollar, and a monthly membership of twenty-five cents.

10. Any person resident in the district, who shall pay to the Trustees the sum of ten dollars, shall be entitled to a life-membership privilege of the Library.

TABLE 101.—*Summary, by States and geographical divisions, of libraries attached to public school systems.*

a Open to public by subscription.

b Open to public.

c For books only.

FREE CORPORATE LENDING LIBRARIES.

[Tables 103 and 104.]

The generous spirit so characteristic in Americans is manifest in the support of libraries as of schools and colleges. Many of the libraries included in the first group considered in this chapter might be included in this group if it were sought to show how many such collections depend upon the past or present bounty of our citizens for a part of their support. Excluding those previously classified, this group includes those entirely supported, so far as known to this Bureau, by private gifts, bequests, or endowments.

Libraries of this class naturally precede those supported by public moneys. It is quite possible to imagine the time when they will be practically superseded in the older and richer parts of the land; but the time is yet very distant when their usefulness in the South and West shall be gone. In these parts of the country private beneficence can find no more useful object, no greater opportunity, than in the endowing of library corporations, which shall circulate good, useful, and entertaining books to all persons in their neighborhood.

TABLE 103.—Summary, by States and geographical divisions, of free lending libraries owned and supported by corporations.

LIBRARIES OF SOCIETIES, ASSOCIATIONS, AND CLUBS.

[Tables 105 and 106.]

The fifth group of libraries considered in this chapter is almost without parallel in any other country. The entire freedom of associative efforts, social, professional, benevolent, and religious—inherent in the structure of American life, makes the formation of societies for various purposes easy, and the collection of books almost inevitable. Notable among social-benevolent associations in library work is the Independent Order of Odd Fellows, and among those of a social-religious kind the Young Men's Christian Associations.

The southern part of the Union, as might be expected, has more of these libraries than any other kind. They are doing a great, though silent, work where it is most needed, and deserve every encouragement. The beginnings, almost as a matter of course, are small, and the difficulties encountered often fatal; yet the fact remains that libraries of this kind are springing into existence in the little villages that sparsely dot the vast expanses of the South and the far West.

The use of the books in libraries of this group is confined mainly to members of the societies with which they are connected. To a certain extent the families of these members have the privilege of use. In nearly all cases a courteous application for permission to use the books for reference meets with a cordial assent; but in general this group is divided from the others in this chapter by the requirement of membership in the society as a preliminary to the borrowing of its books. The following extract from a letter written by Mr. William H. Baxter, secretary of the Petersburg (Va.) Benevolent Mechanics' Association, shows how liberally some of these associations allow their books to be used:

"The library is entirely supported—all its expenses paid—by the association; there are no subscribers and no fees. The library and reading-room are open daily from 9 a. m. to 10 p. m. to all persons who comply with the few rules governing the use of books and periodicals. The association owns its building—'Mechanics' Hall;' the library room is 70 feet long, 28 feet wide, and 19 feet high; the reading-room is 18 by 21 feet."

CORPORATE LENDING LIBRARIES OPEN TO SUBSCRIBERS.

(Tables 107 and 108.1)

Closely connected with the foregoing group, but characterized by a greater freedom in conditions for the use of their contents, are subscription libraries owned by corporations. These indeed are the oldest kind of libraries for public use in this country, and they still outnumber those in any other group, though they do not equal the public lending, or public reference groups in the number of their volumes.

The libraries in this group are liable at any moment to become free lending libraries; a generous citizen may endow one of these on condition that its books shall be lent without charge, or the municipality may make a grant of public moneys upon the same condition.

The losses thus incurred are made up by the continual establishment of new libraries in new or growing centres of population. Very often the new enterprise results from the gift of some resident who gives books or money to buy books, as a beginning.

LIBRARIES WHICH ARE BUSINESS INVESTMENTS.

{Tables 109 and 110.]

The last group considered in this chapter contains circulating libraries conducted for the profit of their proprietors. Doubtless this list is very imperfect; for example, all but nine of the libraries mentioned are in the North Atlantic Division.

The libraries in this group, considered as means of public culture, are almost without value; as a means of personal amusement or relaxation, generally of an innocent kind, they serve their purpose and fill some sort of demand.

TABLE 109.—*Summary, by States and geographical divisions, of circulating libraries which are business investments conducted for profit.*

CHAPTER XIX.

EDUCATIONAL PERIODICALS.

The following list of educational periodicals represents such as are on file in the library of the Office, and such as are found useful in making up the Annual Report. Some in the list, no doubt, have suspended publication. There is no way at the disposal of the Office of finding out when many of these periodicals began or when they ceased publication.

The table is intended to give a brief description of these publications.

TABLE 103.—*Statistics of educa-*

Place of publication.	Principal title.	Name of editor.

CHAPTER XX.

EDUCATION IN FOREIGN COUNTRIES.

Elementary education in London—Agricultural education in France—Trade and industrial schools in Switzerland—American colleges in Asia Minor—Education in the Argentine Republic—Remarks on the tables—Comparative statistics of education in foreign countries (Table 111)—Ratio of school enrolment to total population, etc., in foreign countries (Table 112).

REPORT UPON ELEMENTARY EDUCATION IN LONDON FOR THE YEAR ENDING LADY-DAY (MARCH 25, 1887).

The following information is derived from the report of Rev. Joseph R. Diggle, chairman of the school board for London, and from the reports of the several committees of the board :

Estimated population of London.....	4,217,877
School population (3 to 13).....	a761,826
Above 13 but not exempt.....	34,081
Total	795,907
Accommodation in board schools.....	397,117
Voluntary schools.....	260,270
Total	657,387
Average enrolment in board schools.....	408,337
Average enrolment in voluntary schools.....	208,980
Total average enrolment in state-aided schools	617,313
Average attendance in board schools.....	319,443
Average attendance in voluntary schools.....	165,099
Total	484,542
Percentage of average attendance on average enrolment:	
Board schools.....	78.2
Voluntary schools.....	79.0
Total	74.4

The reports, mentioned as the sources of information, do not give further particulars relative to voluntary schools. From the report of the committee of council on education for the year ending August 31, 1886, it appears that the entire teaching staff for state-aided elementary schools in London was 11,392.

The remaining particulars here given must be understood as relating solely to the 397 board schools.

TEACHING STAFF.

Number of head-masters.....	373
Number of head-mistresses.....	729
Total number head-teachers.....	1,102
Number of assistant masters.....	1,812
Number of assistant mistresses.....	3,559
Total	5,371

In addition to the 6,437 adult teachers enumerated above, the board employed 1,204 salaried pupil-teachers and 425 probationers without salary.

The total expenditure amounted to \$4,903,845, of which \$3,740,877 were for teachers' salaries. The average expenditure per child was \$15.33, of which \$9 was chargeable to rates, and \$1.70 to fees, leaving \$4.63 per child to be met from Government grants.

aOf the elementary school class, which includes six-sevenths of the population.

The results of the inspectors' examinations show that the teaching of elementary subjects has reached the highest point yet attained. The percentages of passes were as follows: arithmetic, 87.3; writing, 90.6; reading, 95.7.

With respect to other subjects, Chairman Diggle says: "There is a space of time daily set apart for the purpose of teaching the children, through Bible lessons, the essential principles upon which right conduct depends. In every school the children are taught to sing, and to sing by note. By means of extension exercises and drill, not only is the physical well-being of the children promoted, but those habits of discipline and obedience are formed, some of the results of which were observed last June in the admirable bearing and conduct of the children at the jubilee fête in Hyde Park. Throughout the boys' departments the boys are taught drawing, whilst needlework is similarly taught in the girls' departments. All the children take English as a class subject, which means that a certain amount of repetition is learnt, and a simple knowledge of English grammar is acquired.

"Practically, all the boys are taught geography, whilst it is taught to about only 10 per cent. of the girls. On the other hand, more than 9,000, or about 11 per cent., of the girls acquired some knowledge of practical cookery. History, which as a class subject is still undefined in the education code, and of which the systematized course is left wholly to the discretion of Her Majesty's inspector and the school teacher, is, I regret to notice, only taught systematically to 2,400 boys and 600 girls. This shows a slight increase in the number of girls as compared with the previous year, but a decrease of 1,000 in the number of boys. Of the children eligible to be examined in specific subjects, exclusive of cookery, about 40 per cent. of the boys and 20 per cent. of the girls were presented and passed. The principal subjects in which the boys were presented were algebra (3,327 passes) and animal physiology (4,764 passes). These subjects account for 8,000 out of 11,000 passes. There were only 413 passes in French, of which 257 were from one division.

"The girls were almost wholly presented for examination in domestic economy, which subject accounts for 4,300 out of 4,800 passes."

He observes, farther, that "The great danger which apparently threatens the steady progress of elementary education is the pressure which is constantly being exerted to render obligatory additional subjects of instruction, without reference to the varying circumstances of the children or the settled conditions of elementary school life. We are in danger of destroying the efficiency of elementary education by attempting to teach a little of many things instead of teaching what it is practicable to teach thoroughly and well. Of the children in the London board schools, 96 per cent. leave school before the age of 13 years. Whilst the child attends school he is taught for about 5 hours daily for five days in the week. In the case of a large proportion of the children, their home circumstances either altogether preclude, or render extremely difficult, the preparation of home lessons in aid of the ordinary school work. When they are absent from the influence of the school, they are surrendered to the education of the street. It is quite impossible to carry out an ambitious educational programme under such conditions as these. But what it is possible to do, is to teach the elementary subjects thoroughly and intelligently, and in such a manner as to instil into the minds of the children the desire for knowledge and a sense of enjoyment in its pursuit."

In 1885 the board began an experiment in manual training for boys in one of the schools. The boys are selected from the seventh standard and instructed in carpentry two afternoons in each week. Through the liberality of the city guilds, a sum of \$4,875 has been provided for the purpose of extending the experiment. In consideration of the fact that 96 per cent. of the children leave school before they are 13 years of age, the chairman urges the importance of a more efficient system of evening or continuation schools by which their instruction may be continued long enough to insure lasting results.

Elementary education is conducted, as has been noted, in board and voluntary schools. The latter are established mainly by the several religious denominations. The following account of the largest and, in many respects, the most remarkable of the voluntary schools is from official sources:

JEWS' FREE SCHOOL, BELL LANE, SPITALFIELDS, LONDON.

The Jews' free school, when founded in 1817, was constructed as a Lancasterian school for 600 boys and 300 girls. The staff for teaching, as in all similar institutions, consisted of a principal teacher and monitors.

These latter, besides giving instruction to the mass of pupils, received special teaching for their own benefit. The results produced by this system were neither good nor satisfactory.

Up till 1840 the school continued to be conducted in this way. In that year Mr. Moses Angel was appointed head-master. He soon discovered the weak points of the

monitorial method and urged upon the managers the necessity of modifying it. At first his representations produced no effect; but when the late Sir Anthony de Rothschild became president of the institution, Mr. Angel found in him an enlightened and liberal-minded supporter. As a consequence, in 1843 the school premises were modified so as to adapt them to what was deemed a better system of education, and since then, at various periods, the development of the building has been steady and progressive.

It should be mentioned that much of the means necessary to pay the large cost entailed by successive structural alterations and additions was provided by Sir A. de Rothschild and his coadjutor, Mr. Alfred Davis, for many years treasurer of the school. This latter gentleman gave to the school £30,000 during his life, and at his death endowed it with a further sum of £30,000.

In 1835, on a plan suggested by Mr. Moses Angel, the head-master, six class rooms were built for boys, and what had been previously the master's house was converted into class rooms for girls. Meanwhile the numbers of pupils of both sexes continued to increase. In 1835 the committee of management, urged by Mr. Angel, bought a large quantity of land and erected on it two immense stacks of class rooms for boys and girls. The school was thus rendered capable of accommodating 1,800 boys and 1,000 girls. Nor was the change in the teaching staff less than that in the building. In 1853 the school was placed under Government inspection, and forthwith the monitors disappeared. Their places were supplied partly by pupil-teachers and partly by adult teachers, and in order to insure a proper supply of these officers Mr. Angel inaugurated a system of training which made the school a normal college as well as a primary school. Under this system all male and female teachers, on attaining the proper age, were expected to submit themselves to the examination for certificates required by the education code; and in addition all male teachers who showed aptitude were educated for degrees at the University of London. Great success attended this new departure. Above two hundred certificated teachers and a large number of graduates (including two M. A.'s, one LL. B., thirty B. A.'s) have been pupils of the school, and the supply is still going on.

It having become evident, in 1883, that the buildings were no longer adapted to the demands, new plans were formed, and in March, 1884, the old buildings were demolished, and on their site a magnificent set of class-rooms, surrounding a great central hall, was erected at a cost of £25,000. By this means the school was rendered capable of accommodating 2,250 boys and 1,250 girls, and in a very short time those numbers of children were entered on the school registers. And indeed such is the popularity of the school, because of its splendid success under inspection, and such are its special attractions for the poor foreign Jewish immigrants into England (victims of persecution and oppression in Russia and Germany), who find in it sympathy and religious consolation and enlightenment, that, notwithstanding the fact that the London school board is providing schools with Jewish teachers for the large numbers of Jews located in the east end of London, hundreds of applicants for admission have to be sent away from want of space and impossibility to provide more teaching power than at present exists.

The actual condition of the school as regards staff and accommodation is as follows:

Boys' department.—One head-master; one vice-master; thirty certificated assistants; six assistants who are past-pupil-teachers; twenty-one pupil-teachers and probationers; forty-five class-rooms and the central hall; a library and private rooms for the masters and the principal teachers.

Girls' department.—One head-mistress; twenty certificated assistants; eight assistants who are past-pupil-teachers; ten pupil-teachers; three teachers of needle-work; a large staff of domestics for teaching cooking, house-work, washing, ironing, and mangling under the direction of the head-mistress; twenty-eight class-rooms; a complete and spacious domestic department, including a dining hall; an extensive laundry and its necessary accompaniments; vestiaries and store-rooms.

Other details.—Annual expenditure of public money about £11,000, of which £3,300 is earned as grant by the examination under inspection. [In addition to this amount a very large sum is provided by private benevolence of Lord Rothschild and his family. By this means every child is clothed once annually, and receives two pairs of boots; summer excursions are provided, medical and other aid is rendered available, where required, for teachers and pupils; and indeed there is no reasonable want felt that is not liberally provided for.]

The property of the school realizes an income of about £3,000. The annual deficit is supplied by public contributions.

Every officer (male and female) on the teaching staff, except the sempstresses, has been trained in this school by Mr. Angel.

The benefits of the school are conferred on the children gratis. There is a nominal charge of 1d per week, but it is not enforced, and no child is sent home for failure of payment.

All teaching, books, university fees, etc., for teachers under training are provided without cost to the teachers.

The ladies of the Rothschild family, with other ladies, regularly attend to supervise the girls' department by examination of children and by consultation with the head-mistress.

The board of management meets once a month for general direction, but there is an executive committee, consisting of the honorary officers, which meets whenever required. Moreover the president is willing to receive the head-master in conference whenever the latter desires to see him. Besides providing for its own wants in the supply of teachers, the free school has sent trained men and women to fulfil scholastic or synagogical appointments in various parts of England, in the British colonies, and to the United States. The Rev. Dr. Raphael Benjamin, M. A., of Cincinnati, Mr. Raphael Dalosta Lewin (of New York); the Rev. Abraham Harris, formerly of Charleston; Mr. Josiah Cohen, barrister at law (originally a teacher), Pittsburg, Pa., are among old pupils of the school.

AGRICULTURAL EDUCATION IN FRANCE.

[The following circular, addressed to the prefects by the French minister of agriculture, gives in a brief form a complete view of the public provision for agricultural education in France.]

MONSIEUR LE PRÉFET: The importance, every day greater, which agriculture is taking in the economic position of nations has attracted to it much attention from the various Governments.

In France a capital of more than a hundred millions is employed, and the least improvement in working and the smallest invention in machinery bring about an augmentation of production, which means for the country an immediate increase of some hundreds of millions in wealth.

Parliament and the public authorities have neglected nothing to second private initiative; shows, subventions to agricultural associations, publications, etc.; everything has been done to keep French agriculture in the position it has always held. Agricultural education, the surest and most powerful means of giving to improvement a new impulse, is being developed in some countries to a high degree, and in France has been the subject of special studies, which has given it a most complete organization.

As you know, at the head of our agricultural education, reestablished in 1876 by the Republic, is the National Agricultural Institute, which corresponds to higher teaching in a university, and which provides the most learned professors and chemists.

There are the three national agricultural schools of Grignon, Montpellier, and Grand-jouan. The schools have been much improved, and are fully equal at present to the demands made upon them.

Then come the practical schools of agriculture founded in 1873, of which the law of July 30, 1875, confirmed the existence. Open to the sons of the numerous class, the working and laborious cultivators of the soil, they receive children from the primary schools, and maintain them at a lower rate than the smaller colleges, and when they are strong enough and their intellectual instruction sufficiently developed, they return to their homes in order to assist in the work of cultivation.

These schools satisfy in that respect the *desiderata* of those who protest against intellectual overpressure, for a portion of the day is devoted to manual and a portion to intellectual labor.

At the present moment these schools number nineteen, and each day we are asked to establish new ones. The time is approaching in the near future when each department will have to possess at least one of these useful institutions; but before founding one it will be necessary to examine carefully the needs and resources of the department, so as to provide in the school for the study and teaching of certain questions relating to culture and the agricultural industry, such as dairying, cheese production, viticulture, horticulture, arboriculture, irrigation, etc.

But the children who enter these institutions direct from primary schools must have had a certain amount of preparation. In that view it will be necessary, in agricultural centres, to direct the courses of higher primary schools especially towards agriculture.

Thus we must organize in the lower primary schools a course of instruction in the first ideas and the principal applications of science in reference to agricultural instruction, over which the teachers must carefully keep watch, for it is the basis of all the others.

I must call your attention more particularly to one point. For the higher primary schools, and especially in the lower, we never find among candidates a sufficient

number of teachers capable of giving good and sufficient tuition in agriculture. This inconvenience is apparent everywhere, and to remedy it the department of the Haute Saône has had recourse to an excessively practical means.

Each year choice is made among the pupil-teachers coming from the normal school of those who have shown the most inclination and disposition for agricultural studies, and of these a certain number are sent, at the department's expense, for a year, to a school farm or a practical agricultural school. There they finish their education, and then they are engaged as tutors in the agricultural centres, where they render great service.

We may add, in conclusion, that courses of lectures in agriculture have been started in some of our schools and colleges, and that almost all our departments have a professor of agriculture.

Such is, in its entirety, the organization of our agricultural instruction. We must now watch over its development and see to its efficient working, and I reckon upon your assistance to obtain its success. You will have to ascertain, among the various branches of instruction, that which best meets the needs of your department. You will let me know what the conseil-général is prepared to do, either in creating scholarships in our agricultural schools for students of the normal schools or in organizing practical schools and fields for experiments or demonstrations, or else in founding an agricultural course in colleges and the higher primary schools.

The minister of agriculture,

BARBE.

PARIS, August 15, 1887.

TRADE AND INDUSTRIAL SCHOOLS IN SWITZERLAND.

REPORT TO THE DEPARTMENT OF STATE BY THE HON. BOYD WINCHESTER, MINISTER
RESIDENT AND CONSUL-GENERAL.

There exists much misapprehension as to what technical education means. There is a difference between learning a trade and learning the principles of a trade. Manual training is, of course, training to manual labor, which has been called the "study of the external world." The chief object of technical education is not to teach particular trades, but to train the pupils to handiness. The object of teaching girls to sew is not to train professional dressmakers, but to make them useful and tidy in their homes. Workshop instruction is not to make boys carpenters or cabinet makers, but it enables them to learn any trade more easily, and makes them generally handy. It is no small part of the value of such training that the workman may be fitted to make his home more commodious, to fit a shelf or cupboard, to replace a broken piece of furniture, or possibly to decorate his room. But whether in after years the student sees proper to become an artisan is not involved in the idea and system of technical education. Its aim is, that when he leaves school he shall carry with him an education serviceable for any occupation of life. Developing a dexterity of hand which will prove valuable whatever his future circumstances may be, and at the same time furnish him with a means of healthy enjoyment, surely is to bestow on him that birthright of every child born into the world which the prevailing systems of education have only too long withheld.

While intelligence can not be too much stimulated, and while bright and active minds should find every opportunity for development toward the highest tasks for which they may be fitted, it is still to be remembered that by far the largest number of children are destined to make their living by industrial labor, and that their minds should not be carried away from this necessity, but rather reconciled to it by a judicious preparation. It has always appeared as though a purely scholastic education made children averse to manual labor. The counting-house has presented to them more fascinations than the workshop. It has been found necessary to correct this one-sided education, which results in every boy or girl leaving school being desirous of engaging in work which is neither manual nor what is misnamed mental.

As a fundamental principle, that knowledge which is best for use is also best for discipline, since any other supposition, as Mr. Spencer has shown, would imply an enormous waste of energy which is quite foreign to nature in any other field of her activity. The best accepted definition of modern public education is that which declares its objects to be to equip and enable boys and girls to earn their own living when they grow up, and to perform efficiently the duties to which they will be called when they reach the estate of manhood and womanhood; that all boys, no matter what is their station in life, should be taught to use their hands, and the girls should be educated so as to become good housewives. The country wants more handicraftsmen, the schools produce too many scribes. The country is crying out for skilled

laborers, and the schools send them clerks or would-be gentlemen of leisure. The farmers and workmen want wives who can make a home neat and happy, and who understand the wise economy of limited resources, and the schools send them women fit only to be governesses. In truth, it is coming to be recognized that technical training ought to be an essential part of the work of every public elementary school, and the children instilled with the idea that there is really no more useful, dignified, or happy condition than that which may be attained through honest and intelligent industry; that manual instruction, apart from assuring the material requisite of existence, is a form of education that is calculated to develop a healthy love of labor, to exercise the faculties of attention, perception, and intuition; not simply to make a workman, but to train up a man.

This question has received much intelligent consideration in Switzerland, and, under the constitution, the Confederation is authorized to establish and maintain industrial and tradeschools. The Polytechnicum, or Technical University at Zurich, a government institution, where instruction is given in applied mechanics, physics, and art, embracing a general and thorough scientific curriculum, is well known, and has been frequently presented to the public as a model school of practical life. But trade and industrial schools, as distinguished from polytechnic, genuine establishments for teaching homely trades, are being made as conspicuous as well as compulsory feature of the Swiss public educational system. They are to be found in every canton, furnishing instruction in numerous branches of handiwork, the boys preferring to become skilled workmen and foremen, and many a girl, though an indifferent scholar, by being taught cutting and thorough needlework, cooking and cleanliness, and methodical habits, that bear so much upon the happiness and existence of the home, is prepared to prove a good, happy, useful, sensible wife and mother. Some cantons with a population not exceeding 300,000 are reported as having as many as one hundred of these schools with over 3,000 pupils.

Trade schools in Switzerland are of ancient origin, having an intimate connection with the great impulse which the watch industry of French Switzerland received in the latter half of last century. In the year 1770 a journeyman watchmaker, named Louis Faegare, applied to Professor Sanssure for some information connected with his trade, which the means of ordinary public instruction did not afford to his class. The professor readily complied, and the result was a series of lectures or rather *conversations* held in the great scientist's own drawing-room. The audience soon increasing, a suitable locality was rented and a sort of club formed under the title of *Société des arts de Genève*. This club, so modest in its beginnings, has survived all the mighty political tempests of a troubled age, the violent annexation of the Genevese Republic to France, and its restoration to the Helvetic Union, and to-day it occupies a high rank among learned societies, and numbers among its honorary members and associates many of the foremost names in modern science. This is the parent of the celebrated watchmakers' school at Geneva, with branches at Chaux-de-fonds, Bienne, Neuchâtel, and Soleure. Pupils are received in these schools when they are passed their fourteenth year, and must remain from three to four and a half years. For the proper artistic education there is provided a special technical school at Chaux-de-fonds, devoted to the art of decorating, which now constitutes a very important feature of the watch industry.

More humble in their first stages, but scarcely inferior as to practical results, are the Swiss straw-plaiting schools, which have succeeded in developing a veritable new industry, commanding markets in the utmost corners of the earth. Some of the poorest portions of the subalpine districts have become well-to-do and flourishing, and it is said at least one little hamlet, which was not to be found in the guide-book a few years ago, is now, from this trade, a thrifty town of some 10,000 inhabitants. The higher instruction in this particular branch extends to the cultivation and acclimatization of various kinds of foreign grasses, furnishing from the coarsest to the finest qualities of straw. In Zurich there is a dress-maker's institute which annually "graduates" some 30 or 40 qualified *Parisian* mistresses and assistant mistresses.

But to turn to trades which either by law or immemorial usage are assumed to require some years' apprenticeship. First in order of importance comes *wood-carving*, a Swiss product that enjoys a world-wide reputation, and has long been a source of no small part of the country's revenue. The schools for wood-carvers seem to have a fully organized faculty. The word faculty is used advisedly, for the courses have an almost amusing resemblance to an academic course. There are lectures with manipulatory demonstrations in the use of the plane, saw, lathe, and all needed tools, and also in the distinctive characteristics of various woods. A school for ornamental work and designs in wood-carving is at Breeng, supported by the communes and canton jointly, and at Interlaken the wood-workers enjoy the services of a "master modeller," paid by the canton. Then there are schools for the study of wood-engraving, sculpture, and art cabinet-making. There is at Winterthur a shoemakers' school with an average attendance of 40, and it has a peripatetic staff of instructors. These

instructors give lessons at various towns, where classes can be organized, continuing from 4 to 6 weeks. This school also issues publications relating to their trade, one of the latest being on the structure of the human foot, and the technical reasons of the Swiss military authorities for the new regulations concerning the contracts for boots and shoes for the army. Other handicrafts have followed the example set by the shoemakers; notably joiners, cabinet-makers, silk-weavers, basket-makers, jewelers, even to umbrellas and parasols, have their cheap training schools.

Drawing, industrial, as distinguished from artistic, is taught in all the Swiss schools, not as an accomplishment, but is considered a necessity. It embraces mechanical and perspective, frequently extending to a course of construction and designing. It is regarded that "drawing" lies at the bottom of all industrial training, enabling one to delineate with precision that which he wishes to express better than he can do it with the language of the pen. In his "Proposed hints for an academy" Benjamin Franklin classed "drawing" with the three *r's*, as subjects necessary for all. It ranks with them because it is the language of form in every branch of industry, from the most simple to the most complex. It makes the workmen more exact, more efficient, and more useful; it is always convenient and often indispensable. As an essential part of popular education, its claim is universally recognized in all of the Swiss schools.

The agricultural and forestry department of the Federal Polytechnic Institute, in its "technology" as signifying science applied to industrial arts, has advanced those interests to positions that otherwise could never have been attained. Switzerland in physical respects is not a bountiful mother-land, neither the climate nor soil is good for agriculture, yet it is surprising what good results are obtained by the general diffusion among the agricultural class of much technical knowledge. With them the cultivation of the land *ex necessitate rei* could not be a simple routine, but a science. Mere practical farming would not return the labor and expense expended, but as an intelligent, educated industry, it has become quite prosperous and profitable.

The agricultural course in the Polytechnic is therefore looked upon as one of its most important, and the course is very thorough and comprehensive as to the Swiss conditions, covering the mechanical and chemical composition of the soil, the scientific basis as to rotation of crops, the periods of growth at which plants take their nitrogen, how draining improves land, and many other similar questions varied in their applications, but ruled by fixed laws, and which can be learned only by some technical instruction outside the daily routine of farm life. Take even the single question of "grasses," in which Switzerland is so much concerned on account of its extensive dairy interest, and the technical information scattered through the influence of the Polytechnic has been of incalculable value. It would be incredible to an American farmer to whom nature is so prodigal, to see the extent and varied use made of the grass crop of the Swiss. To do this, however, he must know something of the chemical analysis of the grass in both the natural and dried state, the feeding values of like weights of the different species, in an equally moist or dry condition, at the final stage of growth which they ought to be allowed to attain, their suitability for permanent or other pastures, the adaptability of some kinds of grasses for certain soils, the amount of growth attained, the time of maturity, their duration, ability to resist drought, strength to overpower weeds, and other circumstances that must be taken into account. Then there are questions relating to the extension of pastures, the drainage of grass land, cultural preparations, the selection of grasses, laying down pastures, the management of old and new grass lands, hay-making, grazing, ensilage, and temporary pastures—all subjects on which the Swiss farmer is enlightened and kept abreast with the most advanced ideas. It may be added that for the benefit of the same class in a great measure are the weekly lectures given at the Polytechnic on the subject of "pisciculture."

The expenses of the distinctively industrial schools, not including the Polytechnic, for the year 1885, were 522,425 francs, paid by the cantons, and 152,041 by the Confederation—a total of 674,466 francs. The chief appropriation of the Confederation is to the Polytechnic, which it entirely sustains.

From what has been said in this report, and a previous one on the Public Schools and Education in Switzerland, it must be conceded that the country enjoys a system of education aptly described by the educational commissioner of France as existing in that country, "at once enlarged and simplified, instructive and attractive, for it does not omit even music and singing; healthiest, for it takes care of the body as well as the mind, and includes gymnastic and manual exercises; more practical, for it teaches drawing, which is the key of all industrial and mechanical professions; and more moral and patriotic, because it is founded on love of country."

To this might be supplemented a summary of the special benefits of the technical and industrial training so conspicuous in the Swiss system.

It tends in addition to imparting dexterity of hand, no less to develop the child physically, mentally, and morally.

It encourages a love of work in the children.
 It inspires respect for the rougher kind of work.
 It cultivates spontaneous activity.
 It habituates to order, accuracy, cleanliness, and neatness.
 It accustoms to attention, industry, and perseverance.
 It develops the physical strength.
 It acts as a counterpoise to too much sitting.
 It trains the eye, and cultivates the sense of form.
 It leads the child to the conception of harmony and beauty.
 It stimulates a love for intellectual honesty.

The United States takes a just pride in its common school system as sustained by the States, and Mr. Atkinson, in summing up the elements that have contributed to the vast gain in the conditions of material welfare in the United States, names seven, and assigns the third position in the seven to the "systems of common schools which are now extending throughout the land." But there is a complaint that the education given at the public expense is not practical enough. That our schools send too many boys into trading, teaching, the professions, or "living by their wits." That the children of that class constituting so large a majority with us who must depend on manual labor, are taught to despise and shun what are called humble callings, and to crowd at starvation wages the occupations of the counter and the desk.

There is no doubt that in the laudable desire to obtain for our children a high standard of general culture, and in omitting to teach the masses the use of the tools by which so many of them will have to earn their living, we are unintentionally leading them to believe that the bread which has been gained by the sweat of the brow is less honorably earned than that which is the result of mechanical quill-driving. Our schools send out too many men "learned, so called, who know the whole gamut of classical learning, who have sounded the depths of mathematical and speculative philosophy, and yet who could not harness a horse, or make out a bill of sale, if their lives depended on it," was the opinion of the late President Garfield. We want a popular education which fits for the heat and task of active life in an age which knows no rest—an education which gives to the mind fleet and safe modes of reasoning, and at the same time in a corresponding degree a clear sight, a firm arm, and training suitable for the various trades and occupations which are essential elements of a prosperous national life.

It is predicted that the closing years of this century are to be distinguished by a great industrial war of far more reaching and serious import than mere military wars. All through our country scientifically and technically trained foreigners are pushing classically educated Americans from their stools and desks. Our competitors in the markets of the world are the most systematically instructed and best informed in Europe, and we must confront a most serious struggle to hold our own. It is only in the matter of technical education that we are deficient as compared with our foreign competitors—in the training which fits men for business; our system seems to be planned too much for a life of leisure. American spirit and energy are unequalled and need but proper training and education to give an earnest of unbounded success in maintaining the future eminence of our country in the world's great field of human art and human industry. The question of manual and industrial instruction which, at first sight, might seem of interest only to those more nearly connected with the organization of our schools, may, if further examined, be found to involve such far-reaching issues that the statesman cannot afford to treat it with neglect. Might not the spirit of cheerful domestic industry which the cultivation of handiwork is calculated to promote do much to banish those evils of intemperance, violence, and social discontent which of late have shown such alarming symptoms? The moral influence it exerts might prove the proper and effective antidote to these evils. There can be no doubt that the ranks of the unemployed and misery and crime are largely swelled by the want of proper training in youth in industrial handicrafts and technical arts; that with a general dissemination of the rudiments of useful trades and employments there would be won a larger share to productive labor, for it would be shown how to put brains into it, and make it more honorable. Thus workshop teaching in the elementary schools would not only give a superior equipment to the children, but might furnish a remedy, an easy, popular, cheap, and healthful remedy for some of the social ills that threaten us. In the words of Mr. James Blake, "Let us head-train the hand-worker, and hand-train the head-worker. For manual training and head training together form the only whole education." Apart from the practical advantages, it has an ethical value in enabling men and women to use all their faculties, for "no man can distort himself by exclusive attention to one order of faculties and especially by neglecting to keep good balance between the two fundamental coordinates of his being—body and mind—without finding the distortion repeating itself in moral obtuseness and disorder."

AMERICAN COLLEGES IN ASIA MINOR.

REPORT TO THE DEPARTMENT OF STATE BY H. M. JEWETT, U. S. CONSUL AT SIVAS, TURKEY.

The leading educational institutions of Turkey are American—that is, are founded by American societies, taught by American teachers, and supported in large part by American money.

The provincial schools supported by the Turkish Government are of a most inferior grade. They teach little besides reading and writing and the memorizing of large portions of the Koran. Much attention is paid to the last. Even in the large cities the Turkish schools are of inferior quality, and but a small proportion of the children attend them. In Sivas, for instance, a city of some 40,000 or 50,000 inhabitants and the capital of a province of 850,000 population, there are but five Turkish common schools, with a total attendance of 937 pupils. The higher institutions consist of a normal school with 60 students, a military school with 202 students, and a high school with 104 students.

There is, on the other hand, a growing aspiration among the people for the dignity and advantages of Western civilization, a desire, especially among the Armenians, for liberal education, and a struggle for institutions affording it. The struggle, however, without help from abroad, is nearly futile. There is neither the necessary experience nor the pecuniary ability. The help indispensably necessary to educational interests in Turkey has been extended by American hands.

The coöperation of American benevolence and native desire for better means of culture has resulted in the establishment, under American auspices, of primary schools, high schools, and colleges in every part of Asia Minor. These schools have already accomplished great good, not only as relates to their own pupils, but as a pattern for the native schools, forcing them to raise their standard and improve their methods.

The people of the United States send annually some \$200,000 through the American Board of Commissioners for Foreign Missions for the support of the work of that organization in Turkey. For many years the work of the board and its missionaries was devoted almost exclusively to religious teaching. Of late years, however, much attention has been devoted to secular education. This branch of missionary work has rapidly increased, until now, as stated, the schools of the highest standard throughout Asia Minor are those founded by the board, and in large part supported by American money. The people of the United States being therefore so largely interested in educational work in Turkey by large outlays of money as well as by sympathy in the work, some observations on the character of these schools may properly be considered as within the province of a consular report.

There are three American colleges in Asia Minor, viz, Aintab College at Aintab, Euphrates College at Harpoat, and Anatolia College at Marsavan. The last named is in this vilayet, and as I can speak of it from personal observation I shall confine this report mainly to it, it being a fair representative of all.

Marsavan, the location of Anatolia College, is some 60 miles southwest of Samsoun, the nearest port on the Black Sea. It is in the main thoroughfare connecting Samsoun, Sivas, Cesarea, Yosgat, and other large cities, and is easy of access from all parts of northern and central Asia Minor, the districts for which it is intended to provide.

This institution, as it stands related to the Turkish Government and to its supporters in the United States, is one department of a more extended system of education. In 1863 an institution of learning was founded at Marsavan by missionaries of the American board. It was called a theological seminary, but aimed at the preparation of both theological and scientific instructors for the people. As time passed the scientific department grew in importance, and without change of principle or governmental relation was developed into a college, complete in itself, assisted by foreign and native contributions, but still holding its original status and becoming the natural development of the original broad idea. One branch of the original institution is scientific, with its constitution and administration, and is Anatolia College. The other branch is the theological department, with its own rules and administration, the former being subservient to the latter in that for those who study theology it furnishes the necessary scientific preparation and mental discipline. The distinctly scientific branch of the institution dates from 1831, being then separated in the form of a high school. The formal organization as a college dates from September, 1886.

While the college is not founded in the interest of any one nationality, but is open to all, its main constituency is among the Armenians and Greeks. The laws and administration of the college bar no student from the free exercise of his religion, and lay no restraint upon him beyond such as is required by pure morality and the laws of health and good order.

The attendance of the college during the year just closed was 135, of whom 108 were Armenians and 27 Greeks.

The distribution of their residences was as follows :

From the city of Marsavan	37
From the vilayet of Sivas, outside Marsavan	30
From the vilayet of Trebizond	20
From the vilayet of Castamoni	6
From the vilayet of Angora	36
From the vilayet of Konia	1
From the vilayet of Constantinople	3
From the vilayet of Nicomedia	1
From the vilayet of Smyrna	1
Total	135

The college has accommodations for about 170 students, including 125 boarders. The buildings occupy a portion of a lot of four acres, finely situated in the highest part of the city. They are built in American style, and, while plain in structure, form the most attractive feature in the city.

The cost of the buildings in use for the college and theological seminary together was about \$7,000, nearly all of which was contributed by the American board.

The college has as endowment the income of \$20,000 set aside for that purpose by the American board, and that of \$4,400 from native sources. There are on hand beginnings of philosophical, astronomical, geological, and chemical apparatus. There is a library of two thousand volumes, mainly English, Armenian, and Greek, with something in French and Turkish.

The yearly charges for students are : For board, £T. 6½; for tuition and minor expenses, £T. 2½; for French, extra, £T. 1; total, £T. 9½=\$41. These charges indicate the cheapness of living; that for board covers the whole expense of food and cooking. Four American missionaries give the whole or a part of their time to the college.

The following salaries are paid native teachers :

	Per month.
Professor of French and Armenian	\$44. 00
Greek teacher	26. 40
Mathematics	22. 00
Assistant Armenian and French	17. 60
Turkish	13. 20
Physician	26. 40

Assistant pupils, \$1.70 per month for one hour's teaching each day in preparatory classes. There are nine regular instructors besides five advanced pupils teaching preparatory classes. A number of the students assist in payment of board by taking care of the rooms and other work. An industrial department is begun, and will be developed as means are secured.

The language of the college is English. Most of the text books are in English, and after the freshman year the teaching of the sciences, etc., is almost entirely in that language. Besides this, a thorough course is given in classical Armenian for the Armenians, in Greek for the Greeks, and in Turkish for all.

The course of study, aside from languages as stated, is in detail as follows :

Term.	Freshman year.	Sophomore year.	Junior year.	Senior year.
First term. . .	Geometry (Eng.) . . .	Conic sections (Eng.); astronomy (Eng.).	Book-keeping (Eng.); chemistry.	Mental philosophy in Armenian and Greek; physiology.
Second term.	Geometry continued.	Surveying (Eng.); history (Eng.).	Physics (Eng.); chemistry; rhetoric (Eng.).	Mental philosophy in Armenian and Greek; evidences of Christianity (Eng.); political economy. (Eng.).
Third term. .	Trigonometry (Eng.)	Botany	Physics (Eng.); zoology (Eng.); logic; (Eng.).	History of philosophy; moral philosophy; Scripture idea of man; international law.

Regarding the influence the college has indirectly upon the people at large, Rev. Mr. C. C. Tracy, president of the Anatolia College, writes: * * * "Though the college is so new an institution its stimulating and formative influence upon the population seems to be very considerable. The most direct result is the wakening of aspirations in young men. There follows immediately the raising of the grade in the common schools and the establishment of higher schools preparatory to the college.

It is already shown that the college tends to lift the whole population to a higher educational level. The influence on Mohammedan schools is not slight. Indeed, the American colleges established in Turkey make it impossible for the Government to hold its own with the people without strenuous efforts in the same direction. This stimulation is healthful and beneficial. If there is some unreasonable jealousy of these institutions there is also increase of friendly relations on account of them. In Marsavan, relations (between the authorities and the missionaries) have never been so kindly as since the development of the college. The city governor has honored himself by cordially aiding the college.

"The governor-general of Sivas, Sirri Pasha, on a recent visit of inspection declared this to be the best school in the region by far, and that no teaching of the Turkish language in the highest Turkish school of the city could equal that taught in Anatolia College. * * * It is but fair to say that the institution could never have reached its position nor could it maintain that position without the friendly offices of the American legation."

HIGH SCHOOLS.

Of almost equal importance with the colleges are the American high schools in most of the larger cities of Asia Minor. Their general character may be judged from the following course of study, that of the high school at Cæsarea:

Department.	First year.	Second year.	Third year.	Fourth year.
English.....	Chart;* first reader;* grammar in Turkish with Armenian characters.	Grammar; Monroe's Second Reader.*	Monroe's Third Reader;* English grammar.	Shakespeare's Merchant of Venice;* Swinton's General History.
Turkish.....	Grammar; reading Arabic script.	Arabic scripture (cont.); Osmanli history.	Telemaque; Turkish writing.	Compendium of laws; writing.
Armenian ...	Grammar; second reader.	Grammar and third reader; history.	Telemaque, with grammar.	Grammar of the ancient language and reading same.
Science	Arithmetic completed; geography.	Algebra; physiology.	Higher algebra;* geometry; physical geography.	Trigonometry; astronomy; natural philosophy; rhetoric (additional if possible); moral science; logic; book-keeping.

* Text-books marked with * are in English.

There are also high schools for girls of the same general grade in Sivas, Talas, Harpoot, and other cities.

EDUCATION IN THE ARGENTINE REPUBLIC.

FROM A REPORT TO THE DEPARTMENT OF STATE BY EDWARD L. BAKER, U. S. CONSUL AT BUENOS AYRES.

It is generally conceded that the crowning glory of the United States is our system of free common schools, the education of the people being considered by us as the surest support, protection, and defence of our republican form of government. And it speaks well for the Argentine Republic that its rulers and statesmen generally are fully aroused to the importance of placing their country upon a higher educational level, as the necessary means of strengthening and perpetuating their own free institutions. In this respect they are not only practically imitating our example, but not content, as we have done, with leaving the education of the people to the different provinces or States, they have made it a national concern and have engrafted the sacred principle in their fundamental law and bedged it around by the safeguards of their constitution. The sixty-seventh article provides as follows:

"Congress shall have power to provide whatever may conduce to the prosperity of the country, the advancement and happiness of the provinces, and the increase of enlightenment, by decreeing plans for general and university education," etc.¹ They

¹ The constitution further requires (Art. V) that "the constitution of each province shall provide for primary education and the administration of justice," thus making the support of common schools obligatory upon them.

have gone even further than this, in showing their appreciation of the importance of education of the people, by making education a department of the Government, under the charge of a cabinet officer.

ITS MOST EFFICIENT PROMOTERS.

While great credit is due to General Mitre, first President of the Argentine Republic under its present constitution, and to Dr. Rawson, the chief of his cabinet, as also to Dr. Eduardo Costa, to the late President Avelleda, and to Dr. Leguizamón, all three of whom at different times occupied the position of minister of public instruction, for their persistent efforts in behalf of popular education, and for their services in developing and extending the system of Argentine common schools, perhaps the place of honor belongs to Dr. Domingo F. Sarmiento, LL. D. He was for 6 years Argentine minister plenipotentiary to the United States, and having been a school-master in his early manhood, he was during his sojourn with us thoroughly impressed with the excellence of our public educational system. His intimacy with the late Horace Mann greatly assisted to develop his ideas on that subject; and when, having meanwhile been elected President of the Argentine Republic, he returned to take charge of the high office, he brought back with him the most advanced opinions and at once proceeded, through the influence he was able to exert, to put them in practical operation here in his own country.

DIFFICULTIES WITH WHICH EDUCATION HAS HAD TO CONTEND.

In a sparsely settled country like the Argentine Republic, in which there are widely extended regions entirely uninhabited and where the centres of population are remote from each other, of course the application of our American system has met great difficulties and inconveniences, but within the last few years the efforts of the Argentine National Government to place the education of the people upon a firm and abiding foundation, with uniform regulations for all the provinces, are beginning to produce their legitimate effects, and this country to-day stands at the head of all the nations of South America in the matter of its public schools, not excepting Chili or Brazil.¹ The position has not been won without a severe struggle and great persistency; for, though the country was a republic, a large and influential portion of the inhabitants could hardly be considered as republican. There lingered with this class a very strong infusion of the old Spanish "hidalgo" exclusiveness, which would not admit or consent that their children should be placed on the same level of school equality with those of the more humble citizens. It is only within a few years that the "upper classes" would permit their children to attend the public free schools, but sent them to special or private schools. With the increase of republican intelligence this feeling, however, is gradually dying out; and now quite all classes of the community, without regard to condition, are to be seen in the public schools of the several provinces.

THE NATIONAL SUPPORT.

The Argentine Government has not assumed to take the matter of public education out of the control of the different provincial governments; but, as far as possible, has left the organization and details of the schools to the districts themselves, limiting its action to a subsidy for their support in those cases where the means of the provinces may be insufficient. This subsidy consists of such an amount of pecuniary aid, each year, as Congress may provide by law. The "plans" and curriculum, however, as the constitution provides, are under the ultimate supervision of the General Government.²

¹ "Primary education is already obligatory in some of the provinces, although in the remote districts where within a diameter of 10 leagues perhaps not five or six school children may be found, there are peculiar difficulties in the way of uniting them for the purposes of instruction. This and other local causes are obstacles to progress. Indeed, there is no other country where so many difficulties in the way of public instruction have to be combated; and if, notwithstanding all, the Argentines have placed themselves at the head of South America in respect to popular education they are really to be congratulated upon their success."—*Republica Argentina* por Ricardo Nap., p. 376.

² The interest which is felt in the cause of education will be understood from ex-President Roca's message to the Argentine Congress. He said: "The department of public instruction has been one of the chief attentions of the Executive. I may say that the subject of free schools has become of such importance that it is a public passion, as any one may well observe by the general movement in this respect in every centre of population." And President Celman, in the address he delivered at his recent inauguration, says: "A government of the people by the people requires that the people shall be educated. The foundation of republican government is the enlightenment of the people; and one of the most important duties of statesmen is to aid and assist it," etc.

COMMON SCHOOL STATISTICS.

The progress which has been made in popularizing these public schools will be seen from the following table, showing the attendance from 1864 to 1886:

Year.	Number in attendance.	Year.	Number in attendance.
1864.....	39,000	1883.....	124,900
1869.....	82,679	1884.....	145,660
1873.....	116,517	1886.....	180,768

There has, thus far, been no regular or reliable census of the Argentine Republic; and hence it is difficult to state the exact number of children in the country between the ages of 6 and 14. That of 1869 put the school population at 409,876; that of 1884 at 497,949. Assuming these figures to be approximately correct, there are then in the Republic over 300,000 (or more than two-thirds) of the children who do not attend school.

Of the 497,949 children comprehended between the ages of 6 and 14 years, 262,763 were males and 235,186 were females, the excess of boys over girls thus reaching to 11.7 per cent. of the entire number; 467,010 were native and 30,939 foreign born.

Of the 145,660 pupils in attendance in 1884, 70,187 were males and 68,473 were females; 104,139 attended fiscal or public schools and 41,521 private schools.

The total number of fiscal schools was 1,817, conducted by 2,877 teachers, at an expense of \$2,560,181.

From these figures it will be seen that the average cost of each scholar was \$24 per annum. The average number of scholars to each school was 95; and the average number of scholars to each teacher was 46.

It further appears from the census that the number of schools in 1884 under the direction of the National Government was 505; under that of the provincial governments was 1,010; under that of municipalities, 142; under that of charitable organizations, 41; under that of religious orders, 32; under that of private teachers, 364.

The total number of persons teaching in the primary schools of the Republic, whether fiscal or otherwise, was 4,078, of whom 2,925 were Argentines and 1,153 were of foreign birth. Of the teachers, 1,502 were males and 1,290 were females; of the assistant teachers, 461 were males and 825 were females; so that, of the entire staff of teachers, 1,963 were males and 2,115 were females.

SALARIES OF PRIMARY TEACHERS.

The salaries which the teachers receive depend a great deal upon the locality and the conditions of the school. The following table shows the maximum prices per month during the year 1884:

	Per month.
Male school:	
Directors or principals	\$165.00
Teachers	100.00
Assistants	50.00
Female school:	
Directors or principals	95.00
Teachers	70.00
Assistants	50.00

In very few of the primary schools, however, are these extreme salaries paid. The average would scarcely exceed one-half the above figures.

NATIONAL COLLEGES.

The primary or elementary schools are supplemented by what are known as national colleges. They quite correspond to our own well-known high schools, colleges, and seminaries. One of these colleges is located in each of the provinces, generally at the capital.

The buildings for these colleges are all of them the property of the nation, and are sufficiently commodious to accommodate such of the students as desire it with board and lodgings.

The number of professors varies with the importance of the college. The national college here in Buenos Ayres has a staff of 34 professors, while that in the province of San Luis has only 7 professors. In the fourteen national colleges there is a total of 282 professors and 106 assistants. The monthly salaries of professors range between \$50 and \$170, according to the number or the importance of the branches taught. The rectors receive from \$100 to \$250 per month. Of those teaching in the national colleges in 1884, 265 were Argentines and 108 were of foreign birth, nearly all nationalities being represented.

ATTENDANCE AND COURSE OF STUDIES.

The following table shows the capacity of the several national colleges and the number of scholars in attendance in 1884 :

National college of—	No. of scholars.	Capacity for scholars.	National college of—	No. of scholars.	Capacity for scholars.
Buenos Ayres	364	1,193	San Juan	80	523
Concepcion	164	584	Rioja	49	474
Corrientes	102	704	Catamarca	54	494
Rosario	69	863	Santiago	39	567
Cordoba	140	1,315	Tucuman	91	1,100
San Luis	87	407	Salta	96	1,144
Mendoza	54	638	Jujuy	47	479

From the above figures it will be seen that the national colleges united are capable of receiving seven times the number of scholars at present in attendance.

The full course of studies in these national colleges comprises a period of six years, and embraces the following branches, to wit: History, geography, elementary mathematics, physics, chemistry, philosophy, higher mathematics, natural history, ancient languages, modern languages, political economy, book-keeping, literature, drawing, music, gymnastic exercises, etc.

Only a small proportion of the students go through with the entire course. The great majority after two or three years quit school for good and enter into active life. During the year 1884 only 52 were duly graduated, while 638 left the colleges before terminating their studies.

SCHOOL OF MINING ENGINEERS.

Some of the national colleges have special schools attached to them. That in San Juan has a school of mining engineers, founded in 1871, under the charge of a director and two professors, in which inorganic chemistry, geology, mineralogy, metallurgy, surveying, cosmography, and other such studies are prosecuted. In 1884 it was attended by 25 special students. The national Government has 20 scholarships in the school at \$25 per month.

NATIONAL AGRICULTURAL SCHOOL.

Connected with the national college at Mendoza is a national agricultural school, established in 1870, in which the science of crop-raising in all its details is proposed to be taught; but I can obtain no statistics in regard to it. I know there are several professorships attached to the institution, but the Argentines are not generally what may be called "agriculturally disposed," and I do not think that the school enjoys a very extensive patronage.

NATIONAL MILITARY COLLEGE.

A military college under the direction of the National Government was established in 1870 here in Buenos Ayres, in the "Palermo Palace," formerly occupied by the Dictator Rosas. It comprehends a five years' course of study, not only in the ordinary branches of education, but in ordnance, cavalry and infantry tactics, topography, fortifications, artillery, military hygiene, international law, etc. The staff of teachers comprises 22 professors. In 1884 the number of scholars was 121. Applicants for admission must be at least 14 years of age and not more than 18 years. Besides the usual elementary branches, they must be acquainted with at least one foreign language.

There is also a military school of a lower grade, which is called the school of corporals and sergeants, established in 1881, under the charge of 14 professors and a director, the greater part being officers detailed from the army. Besides the ordinary branches, practical instruction in the three arms of the service is given. In 1884 there were 120 persons in attendance.

NATIONAL NAVAL SCHOOL.

In 1872 the national Government founded a naval school here in Buenos Ayres with 16 professors, 5 of whom are officers detached from the navy. The course of studies occupies 3 years. Those who are admitted are maintained by the Government. The conditions for admission are that the applicant shall be an Argentine, be from 14 to 17 years of age, and pass an examination in the branches of secondary education.

NATIONAL NORMAL SCHOOLS.

With other valuable information which President Sarmiento acquired while in the United States, in reference to education, was the importance of having the public schools under the charge of competent teachers; and one of his first acts, after his return to the Argentine Republic, was that of organizing normal schools on the basis of our own. The first one was established in 1871. There were in 1884 16 normal schools in different parts of the Republic, 5 of which are for the education of male and 11 for the education of female teachers. These schools had accommodations for 7,268 pupils, but only 3,616 were in attendance. The total number of teachers was 185.

Since the taking of the census of 1884, several additional normal schools have been established: one for males in Santa Fé, one for females in San Luis, one for females in Cordoba, one for males in Mercedes, and perhaps others.¹

The course of study occupies three years, upon the completion of which and after a satisfactory examination the alumni are entitled to diplomas as competent teachers in any of the fiscal schools of the country.

The national Government has 517 scholarships in the different normal schools, which are worth from \$15 to \$20 per month.

At least 200 male and female teachers are fitted for their profession in these different schools each year.

The teachers are of various nationalities; but a large proportion of the females are from the United States on contract, President Sarmiento having initiated the movement to supply teachers from there from his personal knowledge of their capacity and marked ability. The salaries range from \$300 to \$150 for directors, and from \$180 to \$75 for teachers per month.

PROFESSIONAL EDUCATION.

The educational system of the Argentine Republic is made complete by the two national universities of Cordoba and Buenos Ayres; and they are about the only landmarks which are left to commemorate the former glory of the mother country.

UNIVERSITY OF CORDOBA.

The University of Cordoba is, excepting that of San Marcos, of Lima, the most ancient seat of learning in either South or North America.² Its origin dates back to the beginning of the seventeenth century, the Society of Jesus having established it as a "Colegio Maximo" in 1610. In 1613 Fernando de Sanabria, Bishop of Tucuman, made a donation to the institution of all his property, with an annual income of \$2,000, under the name of the College of San Francisco Xavier. As early as 1614 full courses of academic studies were inaugurated; and in 1622 the college, by both royal and pontifical sanction, was raised to the rank of a university, with full power to confer the degrees of bachelor, licentiate, master, and doctor. The first degree conferred was that of bachelor of arts in 1623. In the year 1664 the constitution and by-laws of the university were revised by Father Andres de Rada, then rector of the institution, whereby it was provided that "above all things the studies pursued should be theological," and thus for upwards of a century and a half its destiny was fixed as an institution specially dedicated to the education of priests. There were, however, two distinct faculties, one of arts and one of theology, the first requiring a course of 3 years and the other of 4 years, the management of the university being under the control of a cloister of the doctors and masters having professorships. About the same time two other institutions were established alongside of the university, that of the College of Monserrat, and that of the College of Loreto, but under the same government.

In the month of July, 1767, by order of Charles III, the Jesuits were expelled from all the Spanish possessions; their property was everywhere confiscated, and the University of Cordoba was, by royal decree, entrusted to the Franciscan order. In 1791, a faculty of law was organized in the university, and thus, after an existence of 173 years, it ceased to be a purely theological institution. The first degree of doctor of laws was conferred in 1797. In 1800, by royal letters patent, the university received the name of Royal University of St. Charles and of our Lady of Monserrat. In 1808 the celebrated Dean Gregorio Funes was elected rector of the cloister, and through his influence and exertions the institution was entirely secularized. In 1812 all corporations of the regular clergy were excluded, and the university was organized for three faculties, to wit: of theology, of civil and canon law, and of philosophy, the first two with 4 professors and the latter with 5 professors.

In the long lapse of 75 years since the Argentine Republic threw off the Spanish yoke and declared its independence the university, though it has encountered many adverse fates and been subjected to various misfortunes, has continuously kept its

¹I observe by President Celman's message just sent to Congress that there are now 27 normal schools in the Argentine Republic.

²Our own oldest institution of learning, Harvard University, was founded in 1636.

halls open to the reception of pupils and to the conferring of the learned degrees. In 1854 the university was formally taken in charge by the national Government. Its support has since then been the care and concern of Congress, and numerous reforms have been inaugurated. In 1873 a faculty of natural sciences was organized under the well-known German savant, Dr. Siewart, and others, and an academy of exact sciences, under the celebrated Dr. Burmeister, now director of the Public Museum of Buenos Ayres. In 1877 a department of medicine was established, with 4 professorships in the different branches of the science.

UNIVERSITY OF BUENOS AYRES.

The University of Buenos Ayres is much more recent in its origin. Some, however, date it back to about the beginning of the seventeenth century. They say it was first called the San Carlos College of the Society of Jesus, and was under the charge of priests of that order. In 1621 Bishop Pedro Carranza, out of his own private income, established a professorship of Latin, but after his death the college seems to have been without the necessary support. Following that epoch, according to the *Chronicles of Superior Education in Buenos Ayres*, compiled by the Argentine historian, Dr. Juan Maria Gutierrez, there is a vacuum of a century and a half. What colleges were established or continued during that period we do not know; but in 1773 we learn that the "College of San Carlos" had professorships of theology, philosophy, and languages, with 338 students, the population of Buenos Ayres at that date being 24,205, and said college still being under the charge of the Society of Jesus.¹ In 1776 the name of the institution was changed to that of the College of the Southern Union. In the same year a royal decree was issued by the King of Spain for the foundation of a university in Buenos Ayres, which should be open for the usual courses of a liberal education and with power to confer degrees. But we are told, "so little interest was manifested in the cause of education during those unfortunate times, that the viceroy was content with the college already in existence; and the university remained buried in oblivion." It was not until 1819 that the question of establishing the university was again agitated; and "the sovereign Congress, having carefully examined the proposition for the erection of a university in the capital, formally authorized the establishment, with the proviso that the forms and laws of the same should be first approved by Congress." On the 9th of August, 1821, the captain-general of the province of Buenos Ayres, Martin Rodriguez, issued an edict for "the erection of a university of the first grade, with academic power and jurisdiction, under a board of doctors, which shall be composed of all those who may have obtained the degree of doctor in other universities and are natives of the province, married or domiciled in the same." Three days after, the university, absorbing the College of the Southern Union, was formally opened with great pomp and ceremony. Faculties of theology, jurisprudence, medicine, and the natural sciences were duly organized and supported by the provincial government. Bonpland, the companion of Humboldt, was one of its first professors. President Rivadavia also secured from Europe the services of Dr. Lanz in mathematics, and Dr. Carta in natural sciences. During the dictatorship of Rosas the institution, which had so auspicious a beginning, was suffered to languish from the apathy and terror which possessed the community, and the statistics of the country reveal nothing in regard to its progress. After his expulsion from the country, however, in 1852, the University of Buenos Ayres again received the attention of the Government. It has lately been entirely reorganized, with full faculties in the departments of law and social sciences, of medicine, and of the natural sciences.

RELATIVE POSITIONS OF THESE UNIVERSITIES.

Such are the two great seats of learning of the Argentine Republic. In the University of Cordoba there are 26 professors; in that of Buenos Ayres there are 40. Of the professors in the University of Cordoba 13 are foreigners and 13 are native Argentines; of those in the University of Buenos Ayres, 9 are foreigners and 31 are native Argentines.

The attendance in the University of Cordoba in 1884 was 167 in all departments; in that of Buenos Ayres it was 737.

In the University of Cordoba the annual matriculation to the lectures and courses of study is \$4 for each department. In the University of Buenos Ayres it is \$16 for law and social sciences, \$15 for medicine, and \$16 for the physical sciences, etc.

While the University of Cordoba, owing to its locality and surroundings, has ceased to enjoy the prestige which it possessed in former years, it is now under such influences as must ultimately give it an increased prosperity and a stronger hold on those who are seeking the higher educational privileges. On the other hand, the University of Buenos Ayres, since the interest which the Government has directly taken in its maintenance, has rapidly attained to a high position as an institution

¹Whether the "San Carlos College" of 1621 and this "College of San Carlos" of 1773 are one and the same institution does not seem to be clearly settled.

for professional learning; and to-day, I think I am correct in saying, it surpasses any similar establishment in South America, and in some respects may compare favorably with those of the United States.

PRIVATE AND RELIGIOUS INSTITUTIONS.

I have thus given a general view of the public educational system of the Argentine Republic, *i. e.*, of all such schools and institutions of learning as are sustained directly by the General Government or the respective provinces, or both conjointly. It includes primary and graded schools, national colleges, mining, agricultural, military, and naval schools, normal schools, and two universities. Besides these, however, there are various schools, seminaries, colleges, convents, etc., which are either private, *i. e.*, supported by their matriculation, or religious, *i. e.*, supported by religious orders or societies. These educational establishments are to be found in all the different provinces; and some of these, for the teaching of such branches as appertain to a secondary education, are of a very high rank. Cordoba, Santa Fé, Mendoza, and Buenos Ayres are especially noted for their Catholic colleges and convents. In the city of Buenos Ayres the convents of the Merced, the Visitation, and the Sacred Heart, and the Colleges of San José and of San Salvador, both under the control of the Society of Jesus, are wealthy and well-ordered seats of learning.

ANNUAL EDUCATIONAL EXPENSES.

It is difficult to state very exactly the total amounts which are annually expended by the national and the several provincial Governments for educational purposes, for the reason that I have not before me the district school reports of each province; I have, however, compiled from the report of the Minister of Public Instruction the following figures, which approximately show the total annual expenditure for primary schools. The figures are for the year 1885, and exhibit in separate columns the amounts provided by the nation and the provinces respectively:

Expenditures.	National.	Provincial.	Total.
Teachers' salaries.....	\$305,880	\$1,109,150	\$1,415,030
Text-books and stationery.....	21,197	82,200	103,397
Scholarships.....	938,796	33,735	972,531
Furniture.....	83,137	83,137
Rents.....	173,406	185,083	358,489
Organizing new schools.....	12,000	9,800	21,800
Building school-houses.....	1,019,916	94,817	1,114,733
Care and charge of schools.....	96,828	301,814	398,642
Total.....	2,568,013	1,899,736	4,467,759

The appropriations of the Argentine Government for the two Universities of Cordoba and Buenos Ayres for 1885 were \$231,724; for the fourteen national colleges, \$510,972; for the eighteen normal schools, \$479,712; for the Agricultural School at Mendoza, \$50,988; for the School of Mining at San Juan, \$21,792, etc.

NATIONAL OBSERVATORY AT CORDOBA.

It is not out of place, in treating of the educational establishments of the Argentine Republic, to mention the National Observatory at Cordoba, founded under the administration of President Sarmiento, in 1865. Dr. Benjamin A. Gould, late of Harvard University, a name well known throughout the scientific world, was appointed its first director, and continued until about two years ago to have the charge of the institution. The work which it has already accomplished, and especially that of cataloguing the stars of the southern hemisphere,¹ has been recognized for its thoroughness as a most important addition to astronomical science, and has already placed the observatory in the first rank. Since the resignation of Dr. Gould the observatory has been under the charge of Dr. John M. Thome, of Pennsylvania, promoted from the position of first assistant astronomer.

A meteorological bureau was originally allied to the observatory; and it has already by its publications done a great work in acquainting the world with the climatic conditions of the widely extended Argentine Republic. During the last year this bureau has been separated from the observatory and organized into a distinct department, under the direction of Prof. W. G. Davis, of Pennsylvania. Its meteorological stations now extend from Cape Horn to Jujuy.²

¹ The *Uranometria Argentina* was published in 1880. Since then various other volumes of Catalogues and Results have been published.

² In Volume V of the Meteorological Annals of the Argentine Republic, 1887, I find a letter from Dr. Gould, the former Director, who says: "The object for which this bureau was established is to study and make known the climate of the country and the laws which govern it; and I think I am able to say with the greatest satisfaction that in the few years of its existence the results which have

ARGENTINE NATIONAL MUSEUM.

Another important adjunct to scientific study is the National Museum, located in Buenos Ayres. It was founded by the distinguished statesman General Revidavia, in 1823. It received but little support or encouragement, however, until 1854, when, under the protection of the Government, it was connected with the University of Buenos Ayres. It being necessary to place the museum under the charge of a person especially learned in natural history, the Government (General Mitre being Governor and General Sarmiento Minister of the State) selected the celebrated *savant* Dr. Herman Burmeister, of Germany. He has continued to be the director since 1862. The museum is divided into three sections, to wit: The artistic, the historical, and the scientific. The latter is especially attractive, from the fact that the province of Buenos Ayres has the most abundant deposit of antediluvian animals of any place in the known world. Indeed, the most complete and curious skeletons of fossil animals which are to be seen in the museums of London, Paris, Madrid, Turin, etc., have all been taken from the province of Buenos Ayres. Their exportation has now been prohibited by law, it being required that all such discoveries shall be placed in the Public Museum of Buenos Ayres. Mr. Bravard, in his report upon the geology of the Pampas, counts fifty species of antediluvian animals extracted from the earth of Buenos Ayres, of which only eight were known before his investigations in this country. Among the animals whose fossils are now to be found in the Argentine National Museum are the *Megatherium*, *Myiodon*, *Glyptodon*, *Toxodon*, and a veritable fossil horse, etc. These collections of extinct, as well as of living animals, render the museum of very great importance to persons who wish to dedicate themselves to the study of natural history; while Dr. Burmeister's great work on the physical characteristics of the Argentine Republic is a monument of patient and exacting labor.¹

SCIENTIFIC SOCIETIES.

Nor are scientific societies wanting in the Argentine Republic. Among these may be mentioned the Argentine Zoological Society, the Argentine Geographical Society, the Argentine Scientific Society, the Argentine Historical Society, the National Academy of Sciences, Argentine Ethnographical Society, etc., all of which give to the public yearly publications in the form of Annuals and Reports.

PUBLIC LIBRARIES.

The importance of public libraries as powerful agents to assist in the instruction of the people is now coming to be fully recognized by the Argentines. Although it is only a few years since the Government made a movement in the matter, there are already upwards of 300 of these libraries distributed through the different provinces. There is now a law which provides that the General Government shall contribute an equal sum to that which may already be subscribed to the foundation of new libraries or to the increase of those which are already in existence. There is a central commission here in Buenos Ayres whose business it is to facilitate the acquisition of books for these libraries, to make exchanges, and to generally aid in the formation of new libraries. The most important of these public libraries is that of Buenos Ayres, which now contains about 50,000 volumes, as also many valuable manuscripts concerning the earlier history of the Spanish colonies. The library of the University of Buenos Ayres, as also that of the University of Cordoba, has a collection of about 15,000 volumes, and their archives also contain numerous interesting manuscripts of historical value. That of Cordoba was at one time the largest in South America, but the fortunes of 300 years of civil wars and private thefts have left the collection in a deplorable plight. When I last visited it, a few years ago, it was in a most uncared for condition. The national library attached to the Department of Public Instruction in this capital, although of recent origin, is the nucleus of what is intended to be a grand book repository. It is already beginning to assume important proportions, and merits notice for the attention which it shows for books which illustrate the history and development of the country.

THE NEWSPAPER PRESS.

In regard to the public press—that most efficient and persistent means for the political instruction of the people, and for the education of public opinion—the Argentine Constitution has hedged it around with the amplest safeguards. That instrument expressly provides that “the Federal Constitution shall not dictate laws restricting the liberty of the press nor establish any Federal jurisdiction over it.” It further provides that “all the inhabitants of the nation shall enjoy the right to publish their

been obtained are far greater than at the beginning I had reason to expect. We have already obtained with much exactness many important climatic data for a large number of points in the Argentine Republic; and we have succeeded likewise in drawing the isothermal lines with a very close approximation to the truth for the entire southern half of South America.”

¹ *Description physique de la République Argentine, par Herman Burmeister, etc.*

ideas in the public press without previous censorship." But the law of libel is exceedingly severe. The rights of private persons as well as public officials are carefully guarded against malicious libellers; and any abuse of the liberty of the press is a criminal offence, for which on proper complaint the offender is promptly arrested. Conviction is followed by fine and imprisonment. It may be generally said, however, that the political newspapers of the Argentine Republic are well conducted, and few of them ever venture below the line of fair and legitimate criticism. In this respect, I think, they compare favorably with those of other countries where free discussion is allowed. As with ourselves, the newspaper in the Argentine Republic is looked upon not as a luxury, but as an indispensable necessity. Everybody reads it. Newspapers are now published in all the principal towns of all the different provinces, generally each party having its distinctive organ; and they are following the march of development and civilization to the far frontiers. Indeed, with so sparse a population, the wonder is how so many of them can manage to secure the requisite support. They especially abound here in Buenos Ayres. With a population of 400,000 inhabitants, there are published in this capital 34 daily papers, 18 weekly papers, and 19 monthly papers or periodicals. While many of these publications exhibit but little of what we would call "newspaper enterprise," some of them are as ably edited as any in the world. The *Nacion*, for instance, is edited by ex-President Mitre; the *Censor*, by ex-President Sarmiento; and the *Prensa*, by Dr. Davila. Other nationalities have also their newspapers, there being in Buenos Ayres three printed in the English language, 4 in the German, 3 in the French, and 4 in the Italian. Among the monthly periodicals are those devoted to agriculture and rural interests, to commerce and finance, to home industries, to schools and education, to the medical sciences, to law, and to general literature, many of them exhibiting a high degree of ability and merit.

RELIGIOUS FREEDOM.

It is hardly necessary to add, that in the Argentine Republic there is the utmost freedom of religion and of conscience. The Constitution of the country provides (Art. II) that "the Federal Government shall maintain the Apostolic Roman Catholic Faith." For this maintenance and support of the state church there is an annual appropriation by Congress of about \$200,000. The church establishment consists of one archbishop, whose see is in Buenos Ayres, and four diocesan bishops, who reside, respectively, at Paraná, Cordoba, San Juan, and Salta, together with other lesser dignitaries. The head of the Argentine church is elective; that is to say, the Senate selects a list of three persons, from which the President chooses one to propose to the Pope. The inferior dignitaries are also selected and invested by the Government. Aside from the established church, however, the Federal Constitution (Art. XIV) provides that "all the inhabitants of the nation shall enjoy the right to profess freely their religion;" and (Art. XX) "within the limits of the nation foreigners shall enjoy all the civil rights of citizens, and freely profess their religion." In pursuance of these provisions, there are in the different parts of the Republic numerous churches of other creeds. In the city of Buenos Ayres there is an English Episcopal church, a Scotch Presbyterian church, a German Lutheran church, two American Methodist churches (one of which is a missionary church), and a Jewish synagogue, all with duly installed clergymen, whose functions in marriages, baptisms, deaths, etc., are fully respected and recognized by Argentine law. Most of these churches have religious or Sunday schools attached to them, and some of them have received assistance from the Government.

CONCLUSION.

It will thus be seen that the Argentine Republic not only fully recognizes the great importance of the education and culture of the people by making it a distinct branch of the national administration, but that it is well on the way towards an efficient and liberally supported system of public instruction, which embraces primary and secondary schools, national colleges, normal schools, scientific schools, and the highest branches of university and professional training. In what it has thus far accomplished it has achieved a peaceful victory, far more glorious than any it may have won by the strength of its arms since its independence.

STATISTICS OF ELEMENTARY EDUCATION IN FOREIGN COUNTRIES.

[Table 112.]

Table 112 presents the principal statistics relating to elementary education in foreign countries whose reports have been received at this Office. As few countries report their school population, the total populations have been given in Column 2, Part I, of the table, as a basis for comparing school enrolment.

Where the latest census antedates by several years the year of the school report, estimates of the total population for a nearer date have been employed when attainable. The fact is indicated by a foot-note. Such estimates have been taken from the educational reports, or from the Statesman's Year Book for 1887.

The school ages reported from 36 countries range from 6 to 16 years. From an inspection of Column 3, Part II, it will be seen that 7 countries report a longer period than 9 years, while eight report a shorter period than 8 years. The average period is 8.2 years. The statistics of school population and enrolment in Hungary include the youth 6 to 15 years of age, which are accordingly given as the limits of the school age. In fact, attendance upon elementary schools in Hungary is obligatory from 6 to 12 years of age, inclusive, and upon the "review" or "continuation" schools from 12 to 15 years. The latter may be day, evening, or Sabbath schools. In them the branches pursued in the ordinary elementary schools are reviewed, and somewhat extended. The school age in Bavaria includes also 3 years in the review schools.

In England and Scotland it is customary to include only six-sevenths of the population in estimating the number of children for whom provision should be made in state-aided elementary schools. As the omission of one-seventh of the population in these estimates is misleading when the statistics are tabulated with those of other countries, the numbers showing the entire child population as given in the official reports from those countries are used in this table.

It will be observed also that the school population of England and Wales is given for the years 5 to 14, and also 3 to 14; the former is the obligatory school period. Children are, however, admitted at 3 years of age, and the enrolment includes pupils as young as that, together with a small number above 14 years of age.

In the case of Finland the enrolment includes pupils in infant schools.

The ratios of school enrolment to total population, and to school population when reported, are shown in Table 113.

In England and Wales the school population used in the computation is that of 3 to 14 years of age.

Care has been taken to confine the table to the statistics of elementary schools, *i. e.*, schools below the high school grade, which is substantially the same for all countries. In a very few instances the distinction is not clearly preserved in the original reports, and the totals of enrolment and teachers possibly include high schools. It is certain, however, that in these cases, which are few, the totals are not greatly affected thereby.

A glance at the columns setting forth the number of schools and the school enrolment will show that the word "school," or its foreign equivalent, has various applications. It sometimes signifies the scholars in charge of one teacher, and sometimes a collection of such bodies forming a series of grades in one building.

In the case of Württemberg, the number of teachers' positions is given in Column 12, the number of teachers employed not being reported. Pupil teachers are a feature of the school systems of England and Wales, Scotland, New South Wales, and Japan.

They are included in the totals of teachers for the three former countries, the numbers being 27,804, 3,782, and 931, respectively. The teaching force reported for Ireland includes 665 work mistresses and temporary assistants.

The expenditures reported include as a rule teachers' salaries, and cost of supervision and administration. For France the amount given is the sum expended by the State only.

For Saxony the amount includes expenditure for 1,892 Fortbildungsschulen and two schools for deaf-mutes; for England and Wales and Scotland the cost of night schools is included; and for Ireland and Jamaica the amount is the reported income of the schools, which is presumably equivalent to the expenditure.

In the following countries represented in the table, the elementary schools are free schools: France, Italy, Switzerland, Algeria, British Columbia, Manitoba, New Brunswick, Nova Scotia, Ontario, Prince Edward Island, Costa Rica, Guatemala, Argentine Republic, Chili, Ecuador, Victoria, Queensland, and New Zealand. In these the cost of elementary education is defrayed by state and local funds.

In Venezuela also the law provides for free schools, but this provision does not appear to have been carried into effect. In the remaining countries a portion of the cost is met by tuition fees.

FRANCE.

In addition to the elementary schools of France included in Table 112, the following statistics of superior primary schools are presented: Number of schools, 251; number of teachers, 2,133; number of pupils, 21,939.

School libraries for the use of pupils are reported to the number of 33,800, containing 4,159,408 volumes; also 2,626 pedagogical libraries with 803,419 volumes for the use of teachers.

TABLE 112.—Comparative statistics of elementary education in foreign countries.—PART I.

Countries.	Population.		Date.	Population to square mile.	Name and title of chief officer of education.
	Number.				
1	2	3	4	5	
Austria-Hungary:					
Austria.....	23,031,248	1885	199.00	Dr. Gautsch von Frankenthum, minister of public instruction and ecclesiastical affairs.	
Hungary.....	16,355,686	1884	131.00	Dr. August Trefort, minister of public instruction and ecclesiastical affairs.	
Belgium.....	45,883,278	1885	515.00	Monsieur Thomassen, minister of the interior and of public instruction.	
France.....	38,218,903	1886	187.00	Monsieur Berthelot, minister of public instruction.	
Germany:					
Prussia.....	27,279,111	1886	199.00	Dr. von Gossler, minister of ecclesiastical affairs, of public instruction, and of medical affairs.	
Württemberg.....	1,995,163	1885	200.00	Dr. von Söcher, ministerial director and president of the department of ecclesiastical affairs and public instruction.	
Bavaria.....	5,420,199	Dec. 1, 1885	185.00	Baron J. de Lutz, president of the council, minister of the interior, of ecclesiastical affairs, and public instruction.	
Hesse, Grand Duchy.....	936,340	1880	316.00	Geheimrath Greim, "Oberschulrath," [Councillor of education.]	
Saxony.....	3,179,168	1885	469.00	Dr. C. F. W. von Gerber, minister of state and chief of the department of ecclesiastical affairs and public instruction. Director, F. F. Petzholdt.

Scotland.....	63,938,785	1886	132.00	Vice-president for Scotland, Marquess Lothian; lord president for England, Viscount Cranbrook; vice-president for England, Sir W. Hart Dyke.	
Ireland.....	64,918,338	1885	151.00	Commissioners of national education in Ireland.	
Italy.....	29,943,607	1886	262.00	Signor Michele Coppino, minister of public instruction.	
Japan.....	37,547,650	1883	253.00	Arinori Mori, minister of public instruction.	
Netherlands.....	44,336,012	Dec. 31, 1885	343.00	Dr. J. Heenskerk, minister of the interior.	
Russia in Europe (including Finland).....	87,105,089	1882	42.00	Actual Privy Councillor Delyanoff, minister of public instruction.	
Finland.....	22,303,358	1885	16.00		
Switzerland.....	2,846,102	Dec. 1, 1880	179.00		
British India.....	205,093,375	1881	228.00		
Bombay Presidency.....	23,168,776	1886	123.00	K. M. Chatfield, director of public instruction.	
British Burmah.....	3,736,771	1881	42.00	P. Hordern, director of public instruction.	
Algeria.....	3,817,465	1886	31.00		
Cape Colony.....	6325,000	1885	2.00	Langham Dale, superintendent-general of education.	
Canada:					
British Columbia.....	40,459	1881	.14	S. D. Pope, superintendent of education.	
Manitoba.....	65,954	1881	.53	J. B. Somerset, superintendent of education for the Protestant schools.	

New Brunswick	333, 182	1883	12. 00	William Crockett, chief superintendent of education.
Nova Scotia	440, 572	1881	21. 00	David Allison, superintendent of education.
Ontario	1, 923, 228	1881	19. 00	George W. Ross, minister of education.
Prince Edward Island	108, 891	1881	51. 00	D. Montgomery, chief superintendent of education.
Quebec	1, 359, 027	1881	7. 00	Hon. Gédéon Ouimet, superintendent of education.
Jamaica	585, 535	1881	134. 00	Thomas Capper, inspector of schools.
Trinidad	4171, 914	1886	98. 00	R. J. L. Guppy, superintendent of education.
Costa Rica	4196, 270	Dec. 31, 1886	9. 00	Don Mauro Fernández, minister of commerce, agriculture, finance, and public instruction.
Guatemala	1, 322, 544	1885	28. 00	A. Batres, minister of public instruction.
Nicaragua	275, 815	1883	6. 00	Don Joaquin Elizondo, minister of the interior and of war, in charge of foreign affairs and public instruction.
Argentine Republic	3, 100, 060	1882	6. 00	{ Dr. D. Eduardo Wilde, minister of justice, worship, and public instruction.
Chili	2, 526, 969	Nov. 26, 1885	9. 00	{ Dr. Benjamin Zorrilla, president of the national council of education.
Ecuador d.	1, 001, 651	1885	4. 00	Señor E. C. Varas, minister of justice, worship, and public instruction.
Uruguay	593, 463	1886	8. 00	J. Modesto Espinosa, minister of interior, foreign affairs, and public works; Don Carlos R. Tobar, under secretary reporting on education.
Venezuela	2, 121, 988	1884	3. 00	Señor Aureliano, minister of justice, ecclesiastical affairs, and public instruction; Señor Don Alejandro Goiticoa, minister of public instruction.
Hawaii	80, 578	1884	12. 00	His excellency Walter M. Gibson, president of the board of education.
Maritius	41, 030, 762	1884	3. 00	W. H. Ashley, superintendent of schools.
New South Wales	223, 090	1885	50	James Inglis, minister of public instruction.
Queensland	413, 423	1885	35	B. B. Morison, secretary for public instruction.
South Australia	41, 009, 753	1886	11. 00	John A. Hardley, B. A. B. Sc., inspector-general of schools, minister of education.
Victoria	632, 958	1884	43	Charles Henry Pearson, minister of public instruction.
West Australia	578, 482	1886	5. 00	John S. Cockburn, minister of education.
New Zealand	4133, 791	1885	5. 00	Robert Stout, minister of education.
Tasmania				J. W. A. Grew, minister of education.

CHAPTER XXI.

PAPERS ON EDUCATIONAL SUBJECTS.

CAN SCHOOL PROGRAMMES BE SHORTENED AND ENRICHED?

A PAPER READ BEFORE THE DEPARTMENT OF SUPERINTENDENCE OF THE NATIONAL EDUCATIONAL ASSOCIATION, AT WASHINGTON, FEBRUARY 16, 1888.

BY CHARLES WILLIAM ELIOT, LL. D.

President of Harvard University.

In the process of improving the secondary schools, colleges, and professional schools of the United States—a process which has been carried on with remarkable energy since the Civil War—certain new difficulties have been created for the higher education in general, and particularly for colleges. These difficulties have to do with the age at which young men can get prepared for college, and therefore with the ages at which boys pass the successive stages of their earlier education. The average age of admission to Harvard College has been rising for sixty years past, and has now reached the extravagant limit of eighteen years and ten months. Harvard College is not at all peculiar in this respect; indeed many of the country colleges find their young men older still at entrance. The average college graduate is undoubtedly nearly twenty-three years old at graduation, and when he has obtained his A. B. he must nowadays allow at least three years for his professional education.

In respect to the length of time required for a satisfactory professional training, there has been a great change since the War. Twenty years ago the period of residence at Harvard University for the degree of bachelor of laws was eighteen months; now it is three years. Many of the States of the American Union have passed laws which practically make three years the normal period of study before admission to the bar. Ambitious medical students are giving four years to their medical training. Twenty years ago the leading colleges were satisfied to take men just graduated in arts as tutors in Latin, Greek, and mathematics. Now they expect a candidate for tutorship or instructorship to have devoted two or three years to study after taking his bachelor's degree. School boards and trustees have become correspondingly exacting. In short, professional education in the United States is becoming constantly more thorough and elaborate, and is therefore demanding of aspirants to the professions more and more time. The average college graduate who fits himself well for any one of the learned professions, including teaching, can hardly begin to support himself before he is twenty-seven years old.

This condition of things is so unreasonable in a new country like the United States—being hardly matched in the oldest and most densely settled countries of Europe—that some remedy is urgently demanded; and the first partial remedy that suggests itself is to reduce the average age of admission to college to eighteen. This reduction would save about a year. In effecting this saving of time it is greatly to be wished that no reduction should be made in the attainments which the average candidate for admission now brings to the American colleges; for it is probable that the saving thus effected will not be sufficient in itself, and that the public interests will require in addition some shortening of the ordinary college course of four years. College men, therefore, are anxiously looking to see if the American school courses can be both shortened and enriched; shortened so that our boys may come to college at eighteen instead of nineteen, and enriched in order that they may bring to college at eighteen more than they now bring at nineteen, so that the standard of the A. B. may not be lowered.

The anxiety with which men charged with the conduct of college education look at this question is increased by the relative decline of American colleges and universities as a whole. This relative decline, which was pointed out nearly twenty years ago by President Barnard, of Columbia College, is very visible of late years. The population of the United States is supposed by the best authorities to increase about one-third in every period of ten years. In the ten-year period from 1875 to 1884, inclusive, the universities and colleges included in the tables published by the Commissioner of Education show an increase in their number of students of only eleven per cent., instead of thirty-three and one-third per cent. If we select from the same

tables the ten-year period from 1876 to 1885, the increase is sixteen per cent.; but the explanation of this higher percentage of increase is that the total number of students in the year 1876 was abnormally low, being 2,400 beneath the number of 1875. If we add to the institutions enumerated as universities and colleges all the schools of science, and all the higher institutions for the education of women, we still find that this enlarged list of institutions has not gained students at the same rate at which the population has increased, although the schools of science have made very large gains in the decade referred to. Thus the increase in the number of students in universities and colleges, schools of science, and women's colleges, all taken together, was only twenty-three per cent. in the ten years from 1875 to 1884, inclusive. Obviously there are serious hindrances affecting all the institutions which receive young men and women at the age of eighteen or nineteen, to keep them under liberal training for three or four years. One of these hindrances undoubtedly is that the colleges as a whole held too long to a mediæval curriculum; but a greater hindrance, in all probability, is the burden imposed upon parents when their elaborately educated sons can not support themselves in their professions until they are twenty-seven or twenty-eight years old. Hence the importance of the inquiry: Can school programmes be shortened and enriched?

In studying this problem it is natural to turn first to the schools sometimes called preparatory—that is, to the best high schools and academies; but if we examine the courses of study in these schools, we find that the four years during which they keep their pupils are generally crowded with work. Thus the Phillips Academy, at Exeter, N. H., one of the best academies in the United States, has a four years' course which is so full that hardly any suggestion can be made for compacting or abbreviating it. But what are the requirements for admission to Exeter? "Some knowledge of common school arithmetic, writing, spelling, and of the elements of English grammar." These requirements might reasonably be made of a boy leaving the primary school at eight years of age; yet the average age of admission to Exeter is sixteen and one-half. Now, Exeter is an academy which does not content itself with such low terms of admission unless under compulsion. It would require more if it could get more from the average candidate; but it draws its pupils from a wide area, and its experience is against making greater demands. The Exeter course is itself encumbered with some studies suitable for a boy of ten. Thus it devotes much time to arithmetic, and teaches the very elements of English and English literature. A secondary school which is obliged to take its pupils in the average condition of the boys who enter Exeter can hardly do more for them in the four years between sixteen and twenty than is now accomplished at that academy. What is true of Exeter is true of the whole body of upper schools. They have to make good deficiencies of the lower schools. It is necessary, therefore, to examine the American school programmes from the beginning, to start with the primary school and go on through the grammar school and the high school, searching for the places where time and labor can be saved.

The subject seems to be one chiefly interesting to colleges, but really it has a much broader scope. In the first place, whatever improves the school programmes for those children whose education is to be prolonged, perhaps, until they are twenty-five years old, will improve the programmes also for the less fortunate children whose education is to be briefer. The public schools will never send to higher institutions any very large proportion of the children who are trained in them; but their programmes may best be made substantial and systematic by fitting them to the needs of their most intelligent and fortunate pupils. Moreover, we may reasonably strive to make every grade of the public school programme, primary, grammar, and high—and, indeed, every year in any programme—a thing good in itself, as well as a good introduction to the course of study which lies beyond it. The better the programme is in itself, the better it will be as a preparation for further study. To the primary and grammar schools this principle applies in all its fullness. In the high school and academy the principle needs qualification for the foreign languages only, and for that portion of the programme options should be allowed. The question, Can American school programmes be at once condensed and enriched? has, then, a wide scope, and touches the interests of the whole population.

As evidence conducing to the formation of a just opinion upon the practicability of shortening and enriching our school programmes, an actual comparison of two public school programmes—one French and one American—covering the ages of eight to seventeen, inclusive, is printed on pages 1010-14. One programme is the programme of the French secondary schools, which is followed all over France in the institutions called *lycées*; the other is the programme made by uniting the first three years of the Boston grammar schools with the complete programme of the Boston Latin School. It is assumed that the Boston schools are a fair type for the country. Indeed, the Boston Latin School is supposed to be the best, as it is the oldest, American classical school which is supported by local taxation. In the tables referred to the programmes are placed side by side, so that the courses for the same years of age can be conveniently compared. It is in each case the classical course which is tabu-

lated; but a similar comparison could be instituted between the corresponding programmes in which Latin and Greek are replaced by other subjects. In the French schools Latin and Greek can be in large part replaced by mathematical and scientific studies, and in Boston the English High School offers a programme like that of the Latin school, but with similar substitution of mathematical and scientific studies for all the Greek and some or all of the Latin. The present purpose can be fully accomplished by limiting the comparison to the classical programmes. The French programme was chosen rather than the programme of a German gymnasium, because it is a lower term of comparison, the German programme being more comprehensive, elaborate, and difficult. The French programme is a recent reduction of a programme in force from 1880 to 1885, the reduction amounting to about twenty per cent., and the number of recitations per week in the two programmes (French and American) is nearly the same. It is the best of foreign programmes as a term of comparison, because France is socially a democratic country, politically a republic, and industrially a country whose chief reliance, in the strenuous competition to which its population is exposed within and without, is the intelligence and skill of its producing classes. In all these respects France and the United States closely resemble each other. Moreover, the French boy has no possible advantage over the American boy in strength of constitution, intelligence, or endurance; on the contrary, he is not so large a boy as the American on an average, and he is not so well fed.

A very brief examination of these two programmes side by side reveals several important facts. The French programme is decidedly the more substantial; that is to say, it calls for greater exertion on the part of the pupil than the American, introduces the children earlier to serious subjects, and is generally more interesting and more stimulating to the intelligence. For example, at eight years of age the French boy begins to study a foreign language, either English or German; the American boy begins to study a modern language five years later, at thirteen, when the best period for learning a foreign tongue is already passed. The French boy of eight begins the study of history in a very interesting and stimulating way through the study of biography; the American boy gets no history until he is thirteen, when he begins Greek history. The French boy of eight gives just one-third the time to arithmetic that the American boy gives, and in the whole course does not give to that subject more than one-third the time the American boy gives; yet, for practical purposes, the French are quite as skilful with numbers as the Americans. The French boy gets at natural history earlier than the American boy, and in better subjects. Again, the French programme represents an actual fact, the large majority of French boys passing regularly through it at the ages indicated in the programme; whereas the programme of the Boston Latin School, prepared for the years from eleven to sixteen, inclusive, actually covers the years from thirteen to eighteen, inclusive. In comparing the attainments of the Boston boy with those of the French boy we must, therefore, add two full years to the ages set down in the American programme. The inferiority of the Boston programme, then, becomes very conspicuous. There is no single subject touched in the American programme in which the French boy does not accomplish more than the American. This appears very clearly on comparing the amounts of Latin and Greek set down in the two programmes, but equally plainly in geometry and physics. Moreover, the French course extends a year beyond the American course, and in the class called philosophy gives a comprehensive survey of philosophy and ethics, a thing never attempted in the United States with boys of seventeen, yet found practicable and in the highest degree useful in the French Republic. The preponderance of the French language, the mother tongue, in the French programme is most noticeable. Until Latin and Greek are introduced French occupies half of the whole course. When the study of Latin and Greek is at its height French still claims a substantial portion of the programme; and in the final year, the year called philosophy, French resumes almost exclusive possession of the programme. Great improvements have been made during the last ten years in the study of English and English literature in the best American schools; but the mother tongue does not yet hold anything like the place in American schools that French holds in the French schools. In the French *lycées* geometry comes before algebra, and with the help of drawing is treated thoroughly before algebra is seriously attacked, plane geometry being finished by the time the boy is fourteen years of age. At the Boston Latin School, on the other hand, plane geometry is not completed until the boy is seventeen according to the programme, and nineteen in reality. This brief discussion of the two programmes may reasonably convince any one that the French boy makes a much greater total attainment by the time he is eighteen than the American boy has a chance to make at the best American schools by the time he is nineteen. Thorough study of them will only strengthen this conviction.

The comparison thus instituted gives no warrant for impatient, revolutionary action. The transformation it suggests is not to be wrought in a year, but should be the aim of patient labor during many years. Everybody knows that foreign institutions of education can not be imported; that a nation's educational institutions are strongly influenced by its political, ethical, and industrial conditions, and that the

improvement of schools and colleges must necessarily be slow. It may, however, be justly inferred from this comparison of programmes that the condition of secondary schools in the United States is at present one of inferiority; that the country ought not to be satisfied with that condition, and indeed should strenuously exert itself to improve it, there being opportunity in American programmes for both condensation and enrichment. If it be said that the American boy turns out pretty well after all, and that the American community, as a whole, is as intelligent as the French or the German community, the ready answer is that free institutions are in themselves a considerable education for the population, but that the advantage which the nation has over Europe in possessing free institutions ought not to reconcile it to a position of inferiority as regards schools; it ought to aim to have the best schools, too. If it be practicable to make American primary and secondary schools better, the work of improvement should be set on foot.

The fair inference from the above tables being that it is practicable, it will not be unprofitable to consider some of the means of improving the American public school, from the primary grade through the high school.

1. In the first place, better programmes need better teachers. The great difference between the French and German secondary schools and the American is in the quality of the teachers. Two modes of improving the general body of teachers in the public schools demand special attention. In the first place, school committees, superintendents, teachers themselves, and all friends of public education should constantly strive to procure a better tenure of office for American teachers. The American schools will never equal the schools of Germany and France until well-proved teachers can secure a tenure during good behavior and efficiency, like teachers in those countries. Consideration, dignity, and quietness of mind go with a permanent tenure, and the public school service will never compete successfully with the service of private educational corporations in this country until the public employ is as good as the private employ in this regard. Secondly, the average skill of the teachers in the public schools may be increased by raising the present low proportion of male teachers in the schools. Herein lies one of the great causes of the inferiority of the American teaching to the French and German teaching. The proportion of women teachers in American schools is vastly greater than it is in Europe. The larger the proportion of women in any system of public schools, the larger will be the percentage of new appointments every year and the larger the amount of work done by temporary substitutes. New appointments and substitutes generally mean inexperienced teachers, or, at the best, teachers suddenly put to work in unaccustomed places. This superiority of men as teachers has, of course, nothing whatever to do with the relative intelligence or faithfulness of men and women. It is a well-known fact that many women enter the public schools as teachers without any intention of long following the business, and also that women are absent from duty from two to three times as much as men. Young men who take up teaching as a temporary expedient are also unsatisfactory material. The schools need the life-work of highly trained and experienced teachers. After these two most important means of raising the average quality of public school teachers come lesser means which ought not to be neglected; thus, superintendents and committees can do something to improve teachers by invariably advocating the expenditure of money for teaching, rather than for mechanical appliances or buildings. Cheap teachers and expensive apparatus and buildings are precisely the reverse of wise practice, particularly if the fine buildings are not fire-proof after all. Again, the teaching of the public schools can, of course, be improved by the establishment of teachers' examinations, which secure a better preparation in the average teacher, and by methods of supervision which make known the relative merits of teachers who are on probation. Good progress has been made in this direction during the past ten years.

2. The second direction of untiring effort should be to the improvement of programmes; for the programmes are all important to the steady development of the whole system of schools from top to bottom. A good programme will of course not execute itself; it must be vivified by the good teacher; but an injudicious programme is an almost insuperable obstacle to the improvement of a city's schools. As a rule, the American programmes do not seem to be substantial enough, from the first year in the primary school onward. There is not enough meat in the diet. They do not bring the child forward fast enough to maintain his interest and induce him to put forth his strength. Frequent complaint is made of over pressure in the public schools, but Friedrich Paulsen is probably right in saying that it is not work which causes overfatigue so much as lack of interest and lack of conscious progress. The sense that, work as he may, he is not accomplishing anything will wear upon the stoutest adult, much more upon a child. One problem in arithmetic which he can not solve will try a child more than ten he can solve. One hour of work in which he can take no intelligent interest will wear him out more than two hours of work in which he can not help being interested. Now, the trouble with much of the work in the public schools is that it is profoundly and inevitably uninteresting to the childish mind. To enrich the school programme, therefore, and to make serious sub-

jects follow each other in it more rapidly than now, is not necessarily to increase the strain upon the child; it is, however, to necessarily increase the skill demanded of the teacher, and hence the improvement of teachers must go hand in hand with the improvement of programmes. The best way to diminish strain is to increase interest, attractiveness, and the sense of achievement and growth. American teaching in school and college has been chiefly driving and judging; it ought to be leading and inspiring. Here are these beautiful fields—I will show you the way through them. Here are these rewarding exercises—I will show you how to practice them. Here are these heights—I will lead you up them.

3. Much time can be saved in primary and secondary schools by diminishing the number of reviews and by never aiming at that kind of accuracy of attainment which reviews, followed by examinations, are intended to enforce. Why should an accuracy of knowledge and of statement be habitually demanded of children which adults seldom possess? How many well-educated adults can add long columns of figures correctly or find the least common multiple or the greatest common divisor of six or eight numbers? Nothing but practice can keep one skilful in these exercises, and we may reasonably be grateful that few people are compelled to keep in the necessary practice. Few adult minds retain accurately considerable masses of isolated facts, and it is commonly observed that minds which are good at that are seldom the best minds. Why do we try to make children do what we do not try to do ourselves? Instead of mastering one subject before going to another, it is almost invariably wise to go on to a superior subject before the inferior has been mastered—mastery being a very rare thing. On the mastery theory, how much new reading or thinking should we adults do? Instead of reviewing arithmetic, study algebra; for algebra will illustrate arithmetic and supply many examples of arithmetical processes. Instead of re-reading a familiar story read a new one; it will be vastly more interesting, and the common words will all recur—the common words being by far the most valuable ones. Instead of reviewing the physical geography of North America, study South America. There, too, the pupil will find mountain-chains, watersheds, high plateaux, broad plains, great streams, and isothermal lines. The really profitable time to review a subject is not when we have just finished it, but when we have used it in studying other subjects and have seen its relations to other subjects and what it is good for. For example, the French programme puts a review of arithmetic, algebra, and geometry into the last year. With all his mathematical powers strengthened by the study of algebra and geometry, and with all the practice of arithmetic which his study of mensuration and algebra has involved, the boy returns at seventeen to arithmetic and finds it infinitely easier than he did at fourteen. Further, the French boy has escaped those most exasperating of arithmetical puzzles which a little easy algebra enables one to solve with facility. Many an educated New Englander remembers to this day the exasperation he felt when he discovered that problems in Colburn's Arithmetic, over which he had struggled for hours, could be solved in as many minutes after he had got half way through Sherwin's Algebra. Is it not an abominable waste of the time and strength of children to put them to doing in a difficult way, never used in real life, something they will be able to do in an easy way a year or two later? To introduce any artificial hardness into the course of training that any human being has to follow is an unpardonable educational sin. There is hardness enough in this world without manufacturing any, particularly for children. On careful search through all the years of the public school programmes now in use, many places will be found where time can be saved and strain lessened by abandoning the effort to obtain an exaggerated and wholly unnatural accuracy of work. It is one of the worst defects of examinations that they set an artificial value upon accuracy of attainment. Good examination results do not always prove that the training of the children examined has been of the best kind.

4. In almost all the numerous collections of school statistics which are now published in this country, it appears that the various grades contain children much too old for them, who have apparently been held back. This phenomenon seems to be due partly to the ambition of teachers and partly to the caution of parents. To illustrate with a specific case: In the Boston primary schools, which are intended for children of five to seven years of age, inclusive, 44 per cent. of all the children for three years past were over seven; and in the grammar schools of the same city, which are intended for children of from eight to thirteen years inclusive, from 20 to 24 per cent. were over thirteen. It has already been mentioned that the average age of admission to the Latin school is not eleven years, as indicated in the programme, but thirteen years. It is really thirteen years and three months. For three years past, from one-third to one-half of the graduating classes of the Boston grammar schools have been more than six years in the schools, the programme calling for but six years. In the Boston primary and grammar schools the tendency is in the wrong direction; that is, in 1887 there was a larger proportion of pupils over age than in 1877. The ambition of teachers tends to keep children too long in the several grades, because they desire to have their pupils appear well at the periodical examinations, and also because they like to keep in their classes the bright children as

aids to the dull ones. The caution of parents tends to produce the same difficulty because they fear overpressure; not comprehending that with children, as with adults, it is not work so much as worry that injures, or finding that the existing system adds worry to work. The exaggerated notion that it is necessary to master one thing before a child goes to another is also responsible for the retardation of children on their way through the regular course. The result of this retardation is that the boy comes too late to the high school, or to the Latin school, and so fails to complete that higher course if he is going into business, or comes too late to college if his education is to be more prolonged. The great body of children ought to pass regularly from one grade to another, without delay, at the ages set down on the programme; and any method of examination which interferes with this regular progress does more harm than good. Of late years many experiments have been made on semiannual promotions, and other means of hurrying forward the brighter children. The aim of these experiments is laudable; but the statistics suggest a doubt whether semiannual promotions really promote, and whether they do not disturb to an inexpedient degree the orderly progress of the school work. In general the work of any school must be laid out by years, and on this account irregular promotions will hardly provide a remedy against the common evil of retardation.

5. If we look back a generation, or two generations, in the history of American schools, we shall find that the time spent in school by children during a year has been decidedly reduced, although great improvements have been made during the same period in the ventilation of the school buildings; and various bodily exercises, such as singing, gymnastics, and military drill have been introduced. This reduction of school hours has gone quite far enough, and some steps need to be taken in the other direction. The ideal school should be so conducted that the child's physique is not impaired by attending it, or his enjoyment of his daily life lessened. Then longer school hours would not be unsafe or unwelcome. It should be the teachers that need rest and vacation, and not the children. In cities vacation schools seem to be a desirable addition to our present organization. A long vacation may be a very good thing for children who have at home some intellectual resources, or who can go to the country or to the sea in vacation, and there learn some things not found in books; but for children of ignorant or heedless parents, who have nothing of intellectual life to offer them at home, a long vacation is likely to be a serious injury, particularly in cities and large towns. Vacation schools tend to bring forward, or keep up, the least favored children, thus accelerating the general rate of progress during the year.

The chief objects of this paper were, first, to point out a serious difficulty which is embarrassing the whole course of American education; and, secondly, to indicate briefly a few of the directions in which labor may be wisely spent in improving our school system, to the general end that the pupils may receive a better training in a shorter time. The professional experience and zeal of superintendents and teachers will know how to devise and execute appropriate measures of relief and improvement.

FRENCH AND AMERICAN PUBLIC SCHOOL PROGRAMMES COMPARED.

[To illustrate the preceding paper by President Eliot.]

PROGRAMME OF STUDIES (1885) IN THE SECONDARY SCHOOLS OF FRANCE.

CLASSICAL COURSE.

[In the Preparatory class and in the eighth and seventh classes the number of hours of teaching per week is 20, including one hour a week for drawing.]

PREPARATORY CLASS. Age 8 yrs.

FRENCH.	9½ hours a week. Reading, spelling, writing, and the most elementary rules of grammar.
GERMAN OR ENGLISH.	4 h. a wk. Exercises in reading and writing. Pronunciation. Accent. Indispensable paradigms.
HISTORY.	1½ h. a wk. Biographies of illustrious men—travelers, patriots, inventors. Talks on great personages in French history down to 1789.
GEOGRAPHY.	1½ h. a wk. Meaning of the principal terms in physical geography, illustrated from the town or county. Outlines of the physical geography of France. Geo-

PROGRAMME OF STUDIES (1887) IN THE BOSTON GRAMMAR SCHOOLS (FIRST THREE YEARS) AND THE PUBLIC LATIN SCHOOL.

[In the Grammar Schools the number of hours of teaching per week is 22, including the drawing and music.]

SIXTH CLASS, Grammar School (1st year of course). Age 8 yrs.

ENGLISH.	11 hours a week. Oral and written exercises. Reading. Science lessons, pictures illustrating trades, etc., stories reproduced. Recitation. Writing from blackboard and from dictation. Letter-writing. An authorized reader.
ELEMENTARY SCIENCE.	2 h. a wk. Human body with reference to hygiene. Plants (May to July), seedlings, sponge, coral, oyster, clam, snail. Shells, air, wind, rain, frost, snow, hail, ice.
ARITHMETIC.	4½ h. a wk. Whole numbers to 100,000. Decimals. U.S. money. Liquid and dry measures. Oral exercises.

- graphical drawing illustrated with the globe, chart, and blackboard. The continents.
- ARITHMETIC. 1½ h. a wk. Mental arithmetic—whole numbers.
- OBJECT LESSONS. 1 h. a wk. Coal, metals, coins, clouds, rain, snow, ice, springs, brooks, lakes, wells, canals, seawater, salt, wind, storms, familiar animals and plants. [This set of subjects lasts 2 yrs.]
- DRAWING. 1 h. a wk. Straight lines, angles, circles, polygons, stars, ellipses, spirals, the curves of plants, first notions of perspective. [This set of subjects lasts 3 yrs.]

EIGHTH CLASS. Age 9 yrs.

- FRENCH. 9 h. a wk. Reading, spelling, writing, grammar, and little compositions. Descriptions reproduced.
- GERMAN OR ENGLISH. 4 h. a wk. First notions of grammar, reading, writing, spelling, common phrases. English text-book—Miss Edgeworth's Tales.
- HISTORY. 1½ h. a wk. Outline of French history to Louis XI.
- GEOGRAPHY. 1½ h. a wk. Elementary geography of Europe, Asia, Africa, America, and Oceania. Voyages of discovery.
- ARITHMETIC. 2 h. a wk. Whole numbers. Exercises in mental arithmetic. Easy problems.
- OBJECT LESSONS. 1 h. a wk. Exercises on some of the objects mentioned in the programme for the Preparatory Class.
- DRAWING. 1 h. a wk. Same as for the Preparatory Class.

SEVENTH CLASS. Age 10 yrs.

- FRENCH. 9 h. a wk. As in previous years. Syntax.
- GERMAN OR ENGLISH. 4 h. a wk. Grammar. Auxiliary and irregular verbs. Easy prose. Exercises in reading and conversation. English text—Sanford and Merton, and Old Poz.
- HISTORY. 1½ h. a wk. History of France from Louis XI to 1815.
- GEOGRAPHY. 1½ h. a wk. Elementary geography of France.
- ARITHMETIC & GEOMETRY. 2 h. a wk. Whole numbers and decimals. Metric system. Geometrical figures.
- STONES AND SOILS. 1 h. a wk. Limestones, lime-kilns, mortars, plaster, clay, bricks, pottery, quartz, flint, grindstones, granite, sands, drift, mould, soils, fossils, quarries, volcanoes.
- DRAWING. 1 h. a wk. Same as for the Preparatory Class.

[In the Sixth and higher classes the number of hours of instruction per week is 20, with 2 hours of drawing in addition.]

SIXTH CLASS. Age 11 yrs.

- FRENCH. 3 h. a wk. Grammar. Extracts in prose and verse from French classics. La Fontaine's fables. Simple compositions.
- LATIN. 10 h. a wk. Elements of grammar. Viri Romæ. Translation of French phrases into Latin.
- GERMAN OR ENGLISH. 2 h. a wk. Grammar, reading, conversation, written exercises. English texts—Edgeworth's Tales, Aikin and Barbauld's Evenings at Home. Primer of English history.
- HISTORY. 2 h. a wk. Ancient history of the Orient—Egypt, Assyria, Palestine, Phœnicia, Persia.

- GEOGRAPHY. 2 h. a wk. The earth a ball. Maps. Hemispheres, continents, oceans, climates, most important countries, peoples, cities.
- DRAWING. 1½ h. a wk. Circle, ellipse, oval. Curves. Polygons. Drawing from dictation and from memory.
- MUSIC. 1 h. a wk. Exercises and songs. Writing exercises.

FIFTH CLASS (Grammar School). Age 9 yrs.

- ENGLISH. 11 h. a wk. Same methods as in preceding year.
- ELEMENTARY SCIENCE. 2 h. a wk. Hygiene. Plants (Sept. to Nov., and May to July). Animals—lobster and insects. Sun, moon, and stars. Drainage of vicinity. Rocks and soils.
- ARITHMETIC. 4½ h. a wk. Whole numbers and decimals continued. Avoidupois weight, and units of time. Oral problems in common fractions.
- GEOGRAPHY. 2 h. a wk. Important countries—our own first. Natural features, climate, productions, people, government, customs, and cities.
- DRAWING. 1½ h. a wk. Objects in two dimensions. Octagon, spiral, simple ornament.
- MUSIC. 1 h. a wk. Chromatic scale. Breathing. Songs.

FOURTH CLASS (Grammar School). Age 10 yrs.

- ENGLISH. 10 h. a wk. Oral and written expression, including writing 5 h. Reading 5 h. More advanced books and methods.
- HYGIENE. 1 h. a wk. Continued.
- OBSERVATION LESSONS. 1 h. a wk. Common metals, minerals, and rocks.
- ARITHMETIC. 4½ h. a wk. Common fractions. Long, square, and solid measures. Decimals continued.
- GEOGRAPHY. 3 h. a wk. Meridians and parallels, zones, winds, and ocean currents, climate as affecting man. Physical geography of North America, South America, and Europe. Map-drawing. Apparent motions of sun, moon, and stars. Seasons.
- DRAWING. 1½ h. a wk. Ornament. Geometric forms. Elementary design from plant forms. Objects based on the oval. Cylinder, cone, and vase. Drawing from memory.
- MUSIC. 1 h. a wk. Scale and staff intervals. Different keys to three sharps and four flats.

[In the Latin School the number of hours instruction per week is 20, including 2 hours of military drill.]

SIXTH CLASS (Latin School). Age 11 yrs.

- ENGLISH. Not less than 3 h. a wk. Reading aloud and recitation of selections from prose and poetry. Reading the history of the United States. Grammar. Oral and written abstracts. Writing. Spelling.
- LATIN. Regular forms. Latin into English, and English into Latin. Writing Latin from dictation. Vocabulary.
- GEOGRAPHY. Physical and political geography, with map-drawing, of the United States, the countries of Europe, and the other countries of N. America.

GEOGRAPHY. 1 h. a wk. Europe and the Mediterranean Basin.
ARITHMETIC & GEOMETRY. 1 h. a wk. Common fractions. Decimals. Sphere, poles, meridians, parallels. Latitude and longitude.
ZOOLOGY. 1 h. a wk. Man. Vertebrates. Articulates. Worms. Mollusks. Fauna of the principal regions of the globe.
DRAWING. 2 h. a wk. Perspective with shadows. Drawing from ornaments in relief, from architectural fragments, from the human head. [These subjects serve for 2 yrs.]

FIFTH CLASS. Age 12 yrs.

FRENCH. 3 h. a wk. As in preceding year. Extracts from La Fontaine, Boileau, Racine, Fénelon, Buffon.
LATIN. 10 h. a wk. to Jan. 1, 8 h. thereafter. Grammar, syntax, elements of prosody. Extracts from Phædrus, Ovid, and Nepos. Latin theme, written and oral.
GREEK. 2 h. a wk from Jan. 1. Grammar, accent, paradigms.
GERMAN OR ENGLISH. 2 h. a wk. Reading, writing, conversation, translation. English texts—Scott's Tales of a Grandfather, Franklin's Autobiography, Primer of the History of Greece.
HISTORY. 2 h. a wk. History of Greece.
GEOGRAPHY. 1 h. a wk. The oceans. Physical geography of Africa, Asia, Oceania, and America. Principal states, capitals, and commercial ports. European possessions.
ARITHMETIC & GEOMETRY. 1 h. a wk. Rule of three. Interest, discount, measurement of areas and volumes.
BOTANY. 1 h. a wk. Organs of a plant—root, stem, leaf, flower, fruit, seed. Divisions of the vegetable kingdom illustrated. Outlines of the flora of the principal regions of the globe.
DRAWING. See the preceding year.

FOURTH CLASS. Age 13 yrs.

FRENCH. 2 h. a wk. Grammar finished. Extracts from Racine, Madame du Sévigné, and Montesquieu. Differences between French and Latin construction.
LATIN. 5 h. a wk. first $\frac{1}{2}$ year; 6 h. a wk. second $\frac{1}{2}$ yr. Extracts from Vergil and Ovid. Caesar's Gallic War. Quintus Curtius. Latin composition, oral and written.
GREEK. 6 h. a wk. Grammar, elements of syntax, simple compositions. Extracts from Xenophon and Lucian.
GERMAN OR ENGLISH. 2 h. a wk. Reading, writing, conversation, translation. English texts—De Foe's Robinson Crusoe, Irving's Voyages of Columbus, Miss Corner's History of Rome.
HISTORY. 2 h. a wk. History of Rome.
GEOGRAPHY. 1 h. a wk. Geography of France. French colonies.
GEOMETRY. 1 h. a wk. Straight lines, angles, triangles, parallelogram, circle, secant, tangent, measure of angles.
GEOLOGY. 1 h. a wk. first $\frac{1}{2}$ yr. The principal rocks. Continuous changes of the earth's crust. Principal geologic periods, primary, secondary, tertiary, and glacial.
DRAWING. 2 h. a wk. From architectural fragments. The human figure, from prints and bas-reliefs. Some mechanical drawing of architectural designs.

ARITHMETIC. Review. Metric system. Percentage, with applications.
GEOMETRY. Oral. Forms and simple propositions.
PHYSIOLOGY. Oral instruction to begin March 1st.
Military drill. 2 h. a wk.

FIFTH CLASS (Latin School). Age 12 yrs.

ENGLISH. Not less than 3 h. a wk. Prose—Tanglewood Tales, Autobiography of Franklin, History of England; poetry—selections from Holmes, Bryant, and Scott. Methods those of previous years.
LATIN. Translation of easy prose and of Caesar's Gallic War, Books I and II. Unprepared translation. Writing from dictation. Committing passages to memory. English into Latin—sentences like Caesar's.
GEOGRAPHY. Physical and political geography of S. America, West Indies, Asia, Africa, and Oceania, with map-drawing.
ARITHMETIC. Oral and written. Percentage, including simple and compound interest, discount, and partial payments. Compound numbers. Ratio and proportion. Powers and roots.
GEOMETRY. Mensuration, with oral geometry.
ZOOLOGY. Oral instruction to begin March 1st.
Military drill. 2 h. a wk.

FOURTH CLASS (Latin School). Age 13 yrs.

ENGLISH. Not less than 3 h. a wk. Prose—Church's Stories from Homer, Two years before the Mast, Plutarch (Greek lives); poetry—selections from Lowell, Gray, and Goldsmith. Abstracts, descriptions, oral exercises.
LATIN. Caesar's Gallic War, Bks. III & IV; Ovid, 1,000 lines; Æneid, Bk. I. Some prosody. Same methods as before.
FRENCH OR GERMAN. Pronunciation. Regular verbs. Translation of easy prose. Writing from dictation. Vocabulary. English into French or German.
GEOGRAPHY. General reviews. Astronomical and physical phenomena. Political and commercial relations of different countries.
HISTORY. History of Greece, with historical geography.
ZOOLOGY. Oral instruction to begin March 1st.
ALGEBRA. Including the generalizations of arithmetic.
Military drill. 2 h. a wk.

THIRD CLASS. Age 14 yrs.

FRENCH.	2 h. a wk. Authors—Corneille, Racine, Boileau, Bossuet, Fénelon. Compositions. Outlines of literary history. Free library of French authors.
LATIN.	5 h. a wk. Grammar reviewed. Prosody. Considerable portions of Livy, Cicero, Pliny, Sallust, Vergil.
GREEK.	5 h. a wk. Grammar continued. Extracts from Homer, Herodotus, Xenophon, Lucian.
GERMAN OR ENGLISH.	2 h. a wk. All varieties of instruction. English texts—Vicar of Wakefield, Tales from Shakespeare, Macaulay's History of England, Vol. I.
HISTORY.	2 h. a wk. History of Europe, and particularly of France, from 395 to 1270.
GEOGRAPHY.	1 h. a wk. Geography of Europe, physical, political, and economic. Geography of each state.
ARITHMETIC, ALGEBRA, & GEOMETRY.	2 h. a wk. Arithmetic finished, including square root and proportions. First principals of algebra. Plane geometry finished through area of the circle.
PHYSICS.	2 h. a wk. $\frac{1}{2}$ the yr. Gravity, properties of liquids and gases. Specific gravity. Barometer. Heat.
DRAWING.	2 h. a wk. Decorative figures. Caryatides. Friezes. Doric, Ionic, and Corinthian orders. The human figure, and figures of animals.

SECOND CLASS. Age 15 yrs.

FRENCH.	3 h. a wk. Selections from ten authors covering the XVI to the XIX centuries inclusive.
LATIN.	4 h. a wk. Prosody. The metres of Horace. Authors—Vergil, Horace, Cicero, Livy, and Tacitus.
GREEK.	5 h. a wk. Grammar reviewed. Considerable portions of Homer, Euripides, Plato, Xenophon, and Plutarch.
LITERARY HISTORY.	1 h. a wk. is devoted to the history of Greek (10 lectures), Latin (10 lectures), and French (15 lectures) literatures. This hour is taken from the hours appropriated to the three languages.
GERMAN OR ENGLISH.	2 h. a wk. Grammar reviewed. Reading, conversation, translation, composition. English texts—Julius Caesar, The Deserted Village, The Traveller—a romance of Scott, A Christmas Carol, David Copperfield, extracts from English historians.
HISTORY.	2 h. a wk. History of Europe, and particularly of France, from 1270 to 1610.
GEOGRAPHY.	1 h. a wk. Geography of Africa, Asia, Oceania, and America. Meteorology. Climatology. Productions. Commercial relations. Steam and telegraph lines.
ALGEBRA & GEOMETRY.	2 h. a wk. Algebra completed through equations of the 2d degree. Solid geometry to the cone.
PHYSICS.	2 h. a wk. $\frac{1}{2}$ the yr. Electricity and magnetism. Acoustics.
DRAWING.	2 h. a wk. Same as in the preceding year.

THIRD CLASS (Latin School). Age 14 yrs.

ENGLISH.	Not less than 3 h. a wk. Prose—Plutarch (Roman lives), Addison's papers in the Spectator, one of Scott's novels; poetry—Macaulay's Lays, some of Tennyson's, Emerson's, and Wordsworth's poems. Abstracts, compositions, and translations from a foreign language.
LATIN.	Æneid, Bks. II–IV. Sallust's Catiline. Easy passages from Cicero. Unprepared translation. Committing passages to memory. English into Latin.
GREEK.	Forms. Translation of 25 pp. of the Anabasis. Unprepared translation. Greek from dictation. Vocabulary. English into Greek.
FRENCH OR GERMAN.	Reading. Oral and written translation of modern prose. Dictation. Committing passages to memory. Vocabulary. English into French or German.
HISTORY.	History of Rome, with historical geography.
BOTANY OR PHYSICS.	To begin March 1st.
ALGEBRA.	Including the generalizations of, and applications to, arithmetic.
Military drill.	2 h. a wk.

SECOND CLASS (Latin School). Age 15 yrs.

ENGLISH.	One play of Shakespeare. Part of the English required for admission to college. Recitation of prose and verse. Translations. Compositions.
LATIN.	Cicero, four orations. Vergil's Bucolics, and review of Æneid, Bks. I–IV. Translation at sight. Committing to memory. Vocabulary. English into Latin.
GREEK.	Anabasis I–IV. Sight translations from Xenophon. Greek from dictation. Vocabulary. English into Greek.
FRENCH OR GERMAN.	As in previous year.
HISTORY AND GEOGRAPHY.	History and geography of Greece and Rome completed.
BOTANY OR PHYSICS.	To begin March 1st.
ALGEBRA.	Through quadratic equations. Algebra and arithmetic reviewed.
GEOMETRY.	Plane geometry begun.
Military drill.	2 h. a wk.

CLASS OF RHETORIC. Age 16 yrs.

FRENCH.	4 h. a wk. Eleven authors of XVII, XVIII, & XIX centuries. Fifteen lessons on the history of French literature from the time of Louis XIII.
LATIN.	4 h. a wk. Portions of Terence, Lucretius, Vergil, Horace, Cicero, Livy, and Tacitus.
GREEK.	4 h. a wk. Portions of Homer, Sophocles, Aristophanes, Plato, and Demosthenes.
GERMAN OR ENGLISH.	2 h. a wk. Authors in English—Shakespeare, Washington Irving, Byron, Tennyson, Dickens, and George Eliot.
HISTORY.	2 h. a wk. History of Europe, and particularly of France, from 1610 to 1789.
GEOGRAPHY.	1 h. a wk. Physical, political, administrative, and economic geography of France and its colonies.
GEOMETRY & COSMOGRAPHY.	2 h. a wk. Solid geometry finished—through the sphere. The celestial sphere. Earth, sun, time, moon, eclipses, planets, stars, universal gravitation, tides.
CHEMISTRY.	2 h. a wk. first $\frac{1}{2}$ yr. Hydrogen, oxygen, nitrogen, chlorine, sulphur, phosphorus, carbon, silicon, and their most important combinations. General notions of the metals, oxides, and salts. Principal organic compounds. Nomenclature and notation.
DRAWING.	The human head from nature. Landscape from prints and nature.

CLASS OF PHILOSOPHY. Age 17 yrs.

PSYCHOLOGY, LOGIC, ETHICS, AND METAPHYSICS.	9 h. a wk., of which 8 h. are for the general course and two French authors, and 1 h. for one Latin and one Greek author. The two French authors are chosen each year from a list containing works of Descartes, Malebranche, Pascal, Leibnitz, Condillac, and Cousin. The course includes an account of sensibility, intelligence, and volition, of formal and applied logic, of conscience and duty, of family and country, of political duties, of labor, capital, and property, of immortality and natural religion.
HISTORY.	2 h. a wk. Contemporary history, 1789 to 1875.
ARITHMETIC, ALGEBRA, & GEOMETRY.	4 h. a wk. Review of the whole course in these subjects.
PHYSICS.	2 h. a wk. Optics. Applications of physics—steam-engines, magneto-electric machines, electroplating, telephone.
PHYSIOLOGY, ANIMAL AND VEGETABLE.	2 h. a wk. Nutrition, organs of sense, voice, apparatus for movement, nerves. Vegetable nutrition and reproduction.
DRAWING.	2 h. a wk. Same as in the preceding year.

FIRST CLASS (Latin School). Age 16 yrs.

ENGLISH.	The English required for admission to college. Recitation of prose and poetry. Translations and compositions.
LATIN.	<i>Æneid</i> , Bks. V-IX. Cicero, three orations. Translation at sight. Methods as in previous year.
GREEK.	Selections from Herodotus. Translation at sight. <i>Iliad</i> , Bks. I-III, with prosody. Greek composition.
FRENCH OR GERMAN.	Prepared and sight translation from one or more French or German classics. Reading a history of France or Germany. Other methods as in previous years.
GEOMETRY.	Plane geometry completed.
Military drill.	2 h. a wk.

THE HIGH SCHOOL QUESTION.

ADDRESS AT THE DEDICATION OF THE INDIANAPOLIS HIGH SCHOOL BUILDING, 1885.

BY JOHN W. HOLCOMBE.

Superintendent of Public Instruction of Indiana.

The high school argument has been made, the fight has been fought in this State and the high school is accepted as an essential part of our common school system. Yet, as we have been advised that we ought often to re-examine the grounds of our beliefs, however well settled, such an occasion as this ought not to pass without some inquiry into the principles upon which our public education in its different parts and institutions is based. The question is a large one, and but a small part of it can be gone over in the time allowed this evening.

The familiar proposition that the state has a right to educate because intelligence is essential to good citizenship—from which it follows that it has a right to educate only so far as may be necessary to make good citizens—certainly needs re-examination. That the justification of the state's expenditures for education is the necessity of securing intelligence among the people, so that they will in turn preserve and maintain the state, is an inversion of ideas and an argument at variance with the genius of our institutions.

For what is the state? The French King, inheritor and perfecter of an autocratic despotism, said: "The state, that is I!" The Spartans conceived the state as the corporate unity of all, absorbing into itself all powers, all rights, before which the individual stood stripped of every essential attribute of personal liberty. The French King might have said consistently: "If I give my people a certain kind of training it will be to the advantage of the state, and that is *my* advantage. I will give it to them. May I not do that I will with mine own?" The Spartan Government in effect said this. It assumed control of every citizen in his childhood and relaxed not its hold till old age, training his heart in devotion to Sparta, his intellect in cunning for her service, his body in the hardships, discipline, and tactics of war, for her aggrandizement and defence, regulating his domestic relations, practically destroying his private life—and all for the state, nothing for the man.

But with us, what is the state? Is it the governor—to-day one man, to-morrow another? Or is it the entire body of men who administer the public business—State, county, city, town, and township officers, including school trustees and superintendents? But perhaps it were safer not to attempt a precise definition of our notion of the state. It is at any rate very different from the Spartan's, still more different from the French king's. It is the *res publica*, the commonwealth, the interests that are public and common to all the people. What these interests are, after the few general classes always entrusted to the governing agency, may give rise to differences of opinion. Various socialistic and communistic theories are based upon the belief that the control of government should be extended over a greater or less number of interests beyond those usually committed to it. But, in this country at least, the maintenance of schools is undertaken by society in its corporate capacity, either as the State, the town, or the district; the property of all contributes to the common education. In this we are communists; but we are a practical people, and do not take fright at names. A communistic practice that proves to be of general advantage we adopt. But, if the distinction be appreciable, the people establish and support schools not in their political capacity, but in their corporate social capacity.

The support of education at the public expense is justified on the grounds of utility, economy, and the general good, without special reference to civic duties. From the general diffusion of knowledge results, of course, a higher citizenship, better government, a more perfect state; but to say that the state educates the people to make them good citizens is to substitute effect for cause.

May we not say instead, "The people, wishing to give their children and to secure to the community the benefits of education, find that they can do this cheapest and best and with greatest advantage to society by means of free common schools?" There is the all-sufficient justification of the system. No need to elaborate strained theories as to the right and power of the sovereign State. It is a purely economic and social question, not hard to understand.

It will not be doubted that the average taxpayer secures the education of his children in the public schools cheaper than he could in private schools. The amount he pays in school taxes is less than he would otherwise pay in tuition for equal advantages. This is true of the large majority, the people of small and moderate means. The system is justified to them on the score of economy.

The case is somewhat different with the wealthy. The greater their wealth, the larger their tax. A few contribute far beyond the mere cost of educating their own children. Some also have no children, and yet must contribute in proportion to their property. Do these receive any return commensurate with their outlay? They do,

beyond a doubt. They are benefited in their property. What would be the shrinkage in values in this city if the public schools were forever swept away? The panic of '73 would not compare with it. If property holders reflect well on this point they will never complain of the school taxes.

But many contribute nothing—the poor who pay no taxes. To them the free schools are a precious boon, affording to their children the means of escape from poverty and crime.

Ignorance and poverty are inseparable. Careful calculations based on the statistics of several States show that a common school education adds 50 per cent. to the productive power of the laborer, an academic education 100 per cent., a collegiate education from 200 to 300 per cent. Also, that of the illiterate about 1 in 10 is a pauper, while of the educated the paupers are but 1 in 300. Whence it may be inferred that ignorance is the very probable road to poverty, while education is the almost certain way to competence.

The statistics of crime are not less instructive. An examination of the returns of twenty States shows that one-sixth of the crime is committed by persons wholly illiterate, one-third by persons wholly and substantially so, and that in proportion to numbers there are ten times as many criminals among the illiterate as among the educated.

Property holders can, therefore, well afford to maintain schools in which the non-taxpayers enjoy equal privileges; for if the outlay for this purpose were cut down to any great extent, it is not rash to say that for every dollar so saved two would be paid for the support of paupers and the punishment of criminals. Thus the free school is again justified to the taxpayer on the score of economy alone.

But there are other considerations. Cyrus the Younger said that the greatest ornament to a prince was to be surrounded by prosperous and happy friends. So we may say that the greatest ornament to a citizen is to live in the midst of prosperous and intelligent fellow-citizens. The greatest addition to his dignity, his personal and social privileges, his opportunity for an elevated enjoyment of life, is secured by residence in a cultivated community. Such a community can be created only by the general diffusion of knowledge; for the average can not be high if a large number be left in ignorance.

But while admitting the need and utility of free schools affording instruction in the elementary branches of learning, many doubt the advantage to society at large, and hence the right of society to maintain the high school. It can be supported, they say, only in cities and towns, and in these it is reached by but a small proportion of the pupils; so the people ought not to be taxed to sustain an institution so limited and so partial in its benefits.

The charge that the entire State is taxed to support high schools in cities and towns may be answered by a general denial. In nearly every instance the high school is entirely supported by the community which enjoys its benefits. This city, for instance, with a lower rate of taxation than is permitted to townships and towns, not only maintains her entire graded system for nearly ten months in the year, but out of her abundance contributes many thousand dollars for the payment of teachers throughout the State. The aggregation of wealth here produces a large revenue, the aggregation of population makes it possible to furnish instruction at a less rate per pupil than in the country. The same is true of all centers of population in proportion to their wealth and numbers.

But confining the question within the city limits, can we justify the maintenance of the high school, which is patronized by so few? I think we can.

The term high school is perhaps misleading, as suggesting a school different in kind and separate in some way from the grades below, which are often spoken of as the common schools. Such is not the case. The high school is as much *common* in every proper sense as the lowest primary grade. In the words of the constitution, it is equally open to all and tuition in it is without charge. It is merely the continuation, without break or interruption, of the graded course of study as far as the number of pupils desiring advanced instruction will justify its being carried. Upon what other principle can the course of study be abridged? There are but half as many pupils in the fifth year as in the first primary. If those grades only are to be kept up which accommodate the greatest number, an average might be struck and all above the fifth year abolished.

By the immemorial custom and law of the English-speaking race the age of majority is fixed at twenty-one years. All our institutions, statutes, and social arrangements tally with that theory. So it is held that a person is entitled to school privileges till he is twenty-one years of age. As Socrates would have asked, Is he entitled to receive instruction suited to his advancement or not suited to it? The answer is obvious, as to most of Socrates's questions. As the conditions of life adjust themselves the larger number of pupils in the schools will be young, under fourteen; but many will remain after that age; some will be willing to remain as long as they can receive instruction suited to their needs. Such instruction should be furnished whenever a

sufficient number desire it. It should not be a question of the grade but of the number of pupils. If this be sufficiently large to justify the employment of teachers and assignment of rooms for their benefit, they ought to be accommodated. It is not appreciably more expensive to provide for fifty pupils instruction in advanced studies than to teach the same number the elementary branches.

This principle applies to all times and places. The country district is not prevented from maintaining higher grades by lack of money, but by lack of numbers. When the numbers are collected the money is forthcoming. As a neighborhood becomes thickly settled the district school expands into a graded school, growing as the population grows; and as the village becomes a town and the town a city the school develops into a graded system, the higher departments, in such a city as this, surpassing in variety and extent many colleges of fifty years ago.

Even on the citizen-making theory the high school can not be dispensed with. Reading, writing, and arithmetic may qualify a man to cast an intelligent vote, if he uses these acquirements to advantage; but the collective citizenship of the State must furnish much more than voters. The citizen is now a voter, now a legislator, now a judge, and now a governor. If the State undertakes to make good citizens she must give the men who will fill all the positions incident to citizenship the means of qualifying themselves for their duties.

But whatever theory we may prefer, the return to the public and to every individual upon an investment in a high school is rich and abundant. It is a center of elevating influences, drawing up all the lower schools, awakening the ambition of the young, and making for the ambitions a way to the "career open to talent." More than any other agency it raises the average intelligence and the general tone of thought and manners, sending into the homes of the people disciplined minds, enlarged views, refined tastes, and somewhat of that admirable but indefinable condition of mind and heart called culture—qualities belonging to the realm of infinite values, not to be measured in gold;—making "the poor man's hour of leisure richer than the baron's of old time." The high school is essential to the dignity of the city and the well-being of the citizens.

THE RAISON D'ÊTRE OF THE PUBLIC HIGH SCHOOL.¹

BY GEORGE STUART, A. M.,

Professor of Latin in the Central High School of Philadelphia.

Our ordinary ideas of the ground on which the public high school rests and of its relation to the body politic are too often loose and shifting. At one moment the institution is regarded as the result of a kind of benevolence on the part of the state, and the money appropriated for its support as a public gratuity. At another, the institution is looked upon as one in which the children of a well-to-do favored few may, for their own individual advantage or distinction, add a few finishing touches or some ornamental appendages to the education acquired in the lower schools. Too rarely is the public high school regarded as an essential part of the social structure, and in the same sense in which halls of legislation and of justice or systems of police are parts of the same structure.

To fix and focalize our loose and shifting ideas on this subject, let us ask and answer the following questions: 1. What is the reasonable ground upon which the public high school rests? 2. What is its relation to the body politic? 3. What are its functions and how should it perform them?

In what we have to say on this whole subject, let it be understood that by body politic we mean a "government of the people, for the people, and by the people," and that reasoning which may be irrefragable when used in reference to such a government may fail utterly when applied to other forms of government; and that by public high school we mean any public institution imparting superior as distinguished from elementary instruction; and that institution in which the principles of art, literature, and science are explored to their farthest limits is our ideal public high school, whether it be called academy, school, college, or university.

The application of the argument herein presented is necessarily limited to a popular government; for under other forms of government there are privileged classes, with class prerogatives and strongly guarded barriers separating the classes. But it is the peculiar glory of a free people that the individuals of whatever classes exist pass freely from class to class, or rather gravitate from class to class under the attraction of conspicuous fitness, and he who is governed to-day may be a governor to-morrow.

¹Reprinted from *Education*, January, 1888.

What, then, is the reasonable ground on which the public high school rests? We shall begin the answer by showing that the state does not establish charitable or benevolent institutions from motives of charity or benevolence. On the contrary, the principal motive is undoubtedly selfishness. In proof of this assertion it is not necessary to say that charity can not be predicated of states or that corporations are soulless. The state simply aims at compassing a certain end for its own well-being. It cares not whether A or B is to be the beneficiary; its purpose is that those who are to be beneficiaries shall be the best fitted to be beneficiaries. It recognizes that there always will be beneficiaries entailing burdens and discomforts upon the citizens, and it believes that it is best for the body politic *not to leave to chance* the relief of such persons; and, notwithstanding the expense incurred, society is the gainer in decency, in comfort, and in safety. The state neither gives, nor has the right to give, value for nothing. It always expects at least an equivalent; and if the equivalent be not received, or forthcoming, it either miscalculates or is defrauded. The existence of private charitable and benevolent institutions does not alter the case with the state; these depend on chance, upon which society must not depend; and thus while they lessen, they do not remove public responsibility.

We shall next observe that the state does not establish prisons and penitentiaries from motives of vindictiveness. Here again the principal motive is selfishness. The state does not care one whit whether A or B is to be imprisoned; its intention is that those who are to be imprisoned shall be the best fitted to be prisoners. It recognizes that the violation of law and the commission of crime will be constant, and it believes that it is best for society *not to leave to chance* the removal of this constant menace to its well-being; and notwithstanding the expense incurred in supporting penal institutions, society is the gainer in good order, peace, and safety. The existence of private reformatory institutions does not alter the case with the state. Such institutions aid in the work of repression and reform; but the state believes that, while they lessen, they can not remove public responsibility, and it finds solid foundation for its belief in the irresponsible atrocities of lynch law and vigilance committees.

Similar arguments may easily be framed in defense of other institutions established by the body politic for its own well-being; as the lazaretto, quarantine, public sanitation, illumination of cities, coinage of money, regulation of commerce, etc. In each instance the decision of the state is that the welfare of society demands that the object which the institution has in view *shall not be left to chance*, whatever private enterprise may contribute to its accomplishment.

It is wholly in recognition of public responsibility that common schools are established by the state, and the almost universal consent with which this responsibility is acknowledged is evidence of its weight. Equality of civic rights, equality of civic responsibilities, and equality of civic duties belong to all the citizens of a free state. Without a full enjoyment of rights, a full comprehension of responsibilities, and a full discharge of duties, either the state or the citizen suffers. If the state suffers, the rights of all are menaced; if the citizen suffers, his equality is impaired. Hence the citizen must know; he must receive the elements of education; his intelligence must be awakened and his mind developed; he must learn his relation to the body politic, and while he learns how to enjoy his civic rights, he must also learn not to neglect his civic responsibilities and his civic duties. Hence the popular verdict is that the education of free citizens for citizenship *can not be left to chance*, and that the public school system stands in precisely the same relation to the body politic as other great institutions established for the well-being and safety of society. The existence of numerous private schools can not alter the case with the state; these aid in the dissemination of knowledge and the broadening of intelligence, and, while they lighten, they can not remove public responsibility. They are schools for such of that small, rich minority as may prefer them. The failure of any state to establish free public schools lessens the citizen's responsibility. But recently, in a European city, during the prevalence of the cholera, some soldiers sent to apply disinfectants as a means of sanitation were assailed and either killed or wounded by an ignorant and superstitious mob, who imagined that the disinfectants were in some strange way responsible for the cholera. Such ignorance and superstition can not exist by the side of the free public school. The pupils of such a school soon learn that Heaven never helps a man when he can help himself, and that it is vain at such a time to pray against the force of inertia.

At this point we make the digressive remark that the efficiency of the American public school in training for citizenship is likely to be severely tested in the near future. Until within recent years, the immigration into our country was nearly homogeneous and largely sympathetic, and assimilation was comparatively easy. But recently there has appeared in our midst an element peculiarly alien in race and sympathies, or revolutionary in tendencies, and in numbers sufficiently large to disturb the calm posture of our social forms and the settled traditions of centuries. Against the subversive influence of this element our common school is our tower of strength, and civics as a branch of instruction assumes paramount importance.

We come now directly to the public high school. How is its existence as a part of the social structure justified? How does it appear that society receives far more than an equivalent for its cost and is the gainer by it?

To genius and superior abilities is due the progress of the centuries. The thousand comforts that solace modern social life and the many artificial beauties that surround and adorn it are all the products of art, literature, and science, and due to the directive power of genius and superior abilities. We are in almost every way immeasurably better off than were our forefathers. Blot out that progress and measure the distance separating the two social planes. Does the difference startle you? How does your rush light compare with yon arc light shining like a nascent sun? The difference in power between those two lights is the exact measure of the amount of benefit that the directive power of genius and superior abilities has conferred upon society. Now sum up the whole cost of developing and utilizing those abilities and compare it with the benefit to society. Shall we retain the cost or the benefit? Nay, it is the constantly accruing benefit that enables society to pay the cost and still have a rich surplus.

Society has manifold need of directive power. It is needed in executive, legislative, and judicial seats. It is needed in state, church, and school. It is needed in the administration of finance and in the conduct of social institutions. It is needed in the development and application of art and science, in journalism and in literature. We need inventors and discoverers to give us the best that nature has for us; and we need a whole army of literary workers to form our judgments, guide public opinion, cultivate our tastes, and minister to our intellectual and moral wants. And when these needs are supplied, it is not merely the whole body politic that is benefited, but it is in an especial manner that great majority of it which is not gifted with superior abilities. In the parable of the talents, he that received five talents and he that received ten each returned with splendid usury the trust committed to him; while he that received the one talent could do nothing but bury it in the earth and stand and fold his arms. What would he have done and what would have been done for him under competent directive power? "Education is growth, and develops a force that presses outward, ever enlarging its sphere until it pervades all the region of thought and carries its inquisitions into every field of enterprise and speculation. It does not unify, but diversifies our ideas, sentiments, and convictions. To teach men to think alike is compression. To teach men to think apart is expansion. The force of education is not conservative; it is radical."¹

Genius and superior natural abilities are the inheritance of comparatively few. Rich indeed is that state which has the largest endowment of them, for it has the prime elements of greatest material, moral, and intellectual strength. We can not create them, but we can develop, train, and utilize them to the maximum of their potential, and we can create an hereditary tendency to the transmission of them. Any loss of superior natural ability through lack of the proper development or training is a loss of wealth and power to a community. But great natural abilities are the rare inheritance of rich and poor alike; and the poor (or those who would be unable to pay for higher education) in every state always constitute a very large majority of the people; and, what is noteworthy in this connection, the rich lack the spur of necessity, which is the proverbial mother of invention. That a "government of the people, for the people, and by the people" should be without the public high school, and should look for its manifold directive power to *chance* and that quota of superior natural abilities furnished by a small rich minority is a paradox reaching the climax of folly and the eclipse of reason.

Whither, then, can the state or society look for directive power but to its public high school, college, or university? It is needless here to enlarge upon the value of individual directive power. The total directive power of society is always a whole greater than the sum of all its parts. Yet in times when physical strength in battle counted much more than at present, the directive power of Regulus was rated at a thousand common soldiers. Newton gave a new basis to the solar system and a sure foundation to the nautical almanac. One electric arc light may be equal to six thousand candle-power. At one electric touch the earth contracts her ancient dimensions and New York confers with London at call, London with Calcutta. The Psalm of Life is a perpetual soul-building homily radiant with heavenly philanthropy. The discovery of electric welding during the present year by Prof. Elihu Thomson, a graduate of a public high school, will, it is estimated, save in time and material millions of dollars annually; and to the State of which he is a native it will certainly save in the same way an annual sum far greater than that appropriated to the high school of which he is an alumnus. The military and naval academies of our country furnish additional illustration of the value of directive power and of its benefit to the state. The cadets, admitted on tests and subjected to wholesome mental strain and discipline, are the foster-sons of the Government. For their costly maintenance and education the state expects a *quid pro quo*. Is this cost a gratuity? With what

¹ Allen Andrews.

golden usury it is returned our history bears ample witness in many a national danger averted, in many a national blessing won; yet the laureled fasces never wear a more joyous look than when entwined by the fruitful olive-branch.

The public high school thus stands on solid ground and becomes an essential part of the social structure. It is not merely an essential part, but it is the essential part which originates, moves, and directs all the other parts. It is the eye and sensorium of the body politic and the state's perpetual policy of insurance. The money appropriated for its support is not a gratuity, but a public investment which elevates and enriches society and makes the intellectual greatness and the material strength of states.

The argument which thus necessitates the public high school also prescribes its character. Consider the word *high* in this connection; emphasize it a little; give it voice and a tongue and it will speak eloquently. In order that the resources of art, literature, and science may be realized in ever fresh benefit to society, their underlying principles must be explored to their farthest limits. Equipment, appliances, and corps should be thorough and complete, and instruction in principles sufficiently extensive to lead the student up to original research. Mediocrity in these respects is mental stagnation; inferiority, intellectual starvation and death. Preparation for college or any other private institution is not a necessary function of the public high school, which should either be in itself, or culminate in, a State university. This ideal public high school has already been realized in several parts of our country, and reveals the destined trend in which all our educational lines are surely moving to convergence.

The existence of private high schools, colleges, and universities can not remove public responsibility. These supplement, in some degree, State delinquency, and have in the past furnished considerable directive power. But they are institutions for a small rich minority, and the sum annually paid for higher education in them is a convincing proof of the value of that education in developing and utilizing great natural abilities. And let us not forget that we are speaking for a "government of the people, for the people, and by the people."

Notwithstanding the directness of the reasoning which thus constitutes the public high school an important part of the body politic, a few objections to it are still urged. Of these some are trivial, some specious, but none of them true. The rich man without children, or sending them to private institutions, objects to paying the high school tax because he does not directly participate in the benefit. O for Menenius Agrippa to relate again, as once at the Sacred Mount, the fable of The Belly and the Members. For, dullard that he is, this rich man must then either consent or refuse to pay the tax for street-lighting because a public lamp has not been placed before his own door, or the poor tax, because none of his family is in the poor-house. This rich man is, however, rapidly disappearing.

The remaining objections may all be classed together as those resulting from so-called over-education. These are the most specious and the most dangerous because they are urged by respectable journals and newspapers. The crying evils of this over-education are all summed up in the following extract from one of our most influential journals; the students in our public high schools are "aiming at something beyond and above their social rank and condition." Do you, Mr. Editor, really need to be informed that the object of the most rational system of education is to develop and utilize to their maximum all the child's inherited abilities? Or is it for you to tell us, contrary to reason, just how much of his abilities it will be best to develop and utilize? Do you, an expounder of democratic principles, need to be told that it is the freeman's inalienable right to do that work in society to which his conspicuous fitness is his best title? Or do you mean that it is a serious objection to be too skillful a machinist, too able an engineer, or perhaps too clever an editor? But, pardon us, Mr. Editor; we mistake your meaning. You mean that by some hook or crook society may appoint the graduate to some field of labor for which he is not qualified. That would indeed be a serious blunder; and so much the worse for the society committing it. Now listen to us, Mr. Editor, while we address the same students: "Young men, it is a praiseworthy ambition in you to be aiming to better your condition. Strive to develop and utilize all your inherited abilities. Society has a just right to expect this of you. Conspicuous fitness is the American citizen's only title to superiority. Let great examples stimulate your activity. Recall those worthies the results of whose achievements are in us and around us, graven upon the form and features of the times; which are materialized in a higher plane of social comfort, moralized in broader, more practical, and self-reliant character, and spiritualized in a kindlier vein of charity and benevolence and in works of high art and high literature." Is there any demagogism in this, Mr. Editor?

From the reasoning which necessitates the public high school and determines its relation to the body politic we are enabled to deduce, as natural and easy corollaries, its functions, and the manner in which they should be performed. The State recognizes that all its directive power must be selected from those of its citizens having

the best natural abilities according to their conspicuous fitness, and that, as it is the developing and utilizing power of higher education which gives to directive power its greatest value and efficiency, it can look with confidence and justice for this higher education only to its public high school or State university. It therefore follows that the chief function of the public high school is to furnish the State with the directive power necessary for its political and social well-being.

A secondary function of the high school in each State or subdivision of it must necessarily be to stimulate into greater activity and keener competition all the lower schools, and to act as a radiating centre of thought and mental activity, and thus to elevate and refine the general tone of the community. For the "force of education is centrifugal." The location of the school should always be near the source of largest supply, or in centres of population. The exclusion of everything partisan or sectarian from the course of study tends to develop a character without prejudice or bias, and free intercourse on a plane of entire equality gives to that character a breadth and homogeneity in harmony with the spirit of our government quite unattainable in private institutions, where the pride of wealth and social distinctions based thereon too often build around themselves a narrowing wall of exclusiveness.

The doors of the public high school are open to rich and poor alike. The State does not care whether A or B is to be admitted. Its purpose is that those who are to be admitted shall be the best fitted to be admitted. Conspicuous fitness is the only title to admission, and this fitness must be determined by competitive examination. The quota system of admission is wholly illogical and is based on a misconception of the functions of the school. Socrates justly ridiculed the Athenians for choosing some of their public officers by lot. Promotion in the school should be determined by the same criterion. Tests should increase in severity with the progress of the course. Wholesome mental strain sustained by wholesome exercise is a wholesome hygiene. When the limit of capacity in any case is reached, a vacancy should be declared. Limit of capacity is a safe indication of limit of fitness. The public high school is neither a reformatory nor an asylum for feebleness. The State builds its greatest expectations on the survival of the fittest.

The curriculum or course of study should connect closely with the studies of the next lower schools. The reason for this is obvious. The educative process is a succession of ascending steps connected like the links of a chain.

"From nature's chain whatever link you strike,
Tenth or ten-thousandth breaks the chain alike."

Until within recent years higher institutions of learning had a single undivided curriculum, in which the classics and the humanities played a dominating part. These served mankind long and well. But an evolution was in progress mightier than classic veto or papal bull or warning voice of Cassandra. The latent forces of material nature began to be utilized, and science clamored for recognition. A fierce struggle ensued. Science thrust and the classics parried, and the issue seemed doubtful, until science, opening its subterranean and celestial armories stored with wondrous wealth and power, led its Titan forces—steam, heat, light, electricity, geology, and the wonder-working analyses of chemistry—into the field and drove the classics and the humanities from more than half the educational arena. Then they compromised, joined hands, and divided all mastery between them. To science fell directive power over matter; to the classics and the humanities directive power over mind. Thus, directive power is utilized—

ON THE MATERIAL SIDE, in mining, metallurgy, engineering, architecture, ship-building, applied chemistry, applied physics, manifold manufacture, applied mechanics, etc.

AND ON THE HUMAN SIDE, in law and legislation, judicature, politics, police, sociology, journalism, literature, theology, painting, sculpture, music, oratory, etc.

Hence all our higher institutions of learning now divide the curriculum into two main branches, which may be called scientific and literary. There is, of course, even in the highest university courses, a frequent overlapping of these branches, and each becomes contributory to the other. This division of the course became a necessity resulting both from the vastness of the intellectual field and the utility of the economic principle of division of labor. The field demands almost infinite energies; yet, by the distribution of finite energies to its several parts, this almost infinite demand is readily supplied. It is better to know everything of something than something of everything.

At what point in the curriculum of the public high school this division may be safely made depends upon the quality and quantity of the requisites for admission. The average stage of preparation attained in our public grammar schools makes necessary a common curriculum for some time after admission, and for obvious reasons. Some studies have a high disciplinary value, some a high culture value, and some have both. For example, higher mathematics, aside from high scientific

value, has also a high disciplinary value; language studies, literature, and history have a high culture value; and the study of a cultivated language not vernacular has both a high disciplinary and a high culture value. Such studies give roundness, fulness, and symmetry to mental development, and avert that one-sidedness which results from the pursuit of special courses without due preparation for them. We do not mean that *all* such studies are necessary. We believe that in a curriculum of four years, common studies for the first two years would be ample preparation for special scientific and literary courses. The arrangement of curricula for the latter courses presents little difficulty, and the only limitation in it is the element of time.

There are sometimes taught in public high schools subjects which have no relation whatever to the end in view. Such subjects are book-keeping, type-writing, phonography, sewing, and cooking. The criterion of fitness in any subject to be a branch of instruction is extensive application of principle and prospective benefit to society. Benefit that remains wholly with the individual or individual interests can find no claim to public recognition. Judged by this criterion, how can any of these subjects be justified? The mathematical principles of book-keeping are taught in arithmetic, and balancing accounts may very properly be taught as a practical application of them. Type-writing and phonography are manual operations involving no principle whatever, and have just the same title to public recognition as shoemaking and tailoring. The benefit remains wholly with the individual. Sewing and cooking can be justified as branches of instruction only on the ground that those who are taught will either sew and cook or teach sewing and cooking for the public, and that society will be benefited thereby. The normal school is justified as a public institution solely on the ground that its function is to furnish teachers for the public schools.

And now in conclusion. The scientific movement before mentioned advanced with ever-widening flow. Matter, material force, and mechanism became the ruling deities. They open vistas richer than the wealth of Ormus or of Ind. Their products choke the avenues of trade and line all the ways of commerce. The prospect of riches stimulates every activity. The altars of Mammon smoke with a perpetual sacrifice, and too often the sole object of our vows is the golden though fatal gift of Midas. Money is at last our supreme good, because in it we have found the measure of a man, the next of kin to heaven. "In fact, if we look deeper, we shall find that this faith in mechanism has now struck its roots deep into man's most intimate, primary sources of conviction; and is thence sending up, over his whole life and activity, innumerable stems, fruit-bearing and poison-bearing. The truth is, men have lost their belief in the invisible, and believe and hope and work only in the visible; or, to speak it in other words, this is not a religious age. Only the material, the immediately practical, not the divine and spiritual, is important to us. The infinite, absolute character of virtue has passed into a finite, conditional one; it is no longer a worship of the beautiful and good, but a calculation of the profitable."¹

Against these poison-bearing stems and against a tendency so materialistic our methods in scientific training should provide some preservative. The neglect of pure culture studies—the neglect of the humanities—especially the neglect of them in scientific education, is in some measure responsible for much of our materialism. Education means vastly more than a mere whetting of the intellectual faculties; it also means spiritual growth, a sensitizing of the moral faculties, and the moulding of character for manhood. But let us not therefore undervalue science and its golden freightage of blessing. "Science is noble and good, but the progress of the soul is better. Genius is a bird of morning, and its song is always the exponent of the most recent pulse of human passion, human knowledge of beauty, human sympathy with the joys and sorrows of the world. The rocks may give up the last secret of their hearts; the sea, too, may disgorge its treasures; but at last it is the soul of man that is the poet's field of study—the soul that walked with God upon chaos in the dark hour before the dawn of creation, the soul that still walks with him as the morning twilight slowly broadens into perfect day."²

Mere science, without cultivation on the human, the moral, and the spiritual side, is apt to be unimpassioned, unimpressive, and unimaginative. No mere science ever writes poetry, and no pathos heaves the diaphragm of the phonograph. Let not science be made ignoble by the clod of materialism. Let it roam the macrocosm in full sympathy with the microcosm. While it finds melody only in sonorous vibrations, still let the golden planets, beating against the tides of ether, peal out to fancy's ear ethereal chimes; and while it sees the birth of dewy morning only in luminous undulations, still let its eye of poesy behold the seeds of Aurora, breaking from the barriers of night,

"arise,
And shake the darkness from their loosened manes,
And beat the twilight into flakes of fire."

MEDICAL COLLEGES AND THE MEDICAL PROFESSION.

BY CHARLES WARREN, A. M., M. D.

The results of some investigations about the relation of medical colleges to the medical profession in the United States are considered by the Commissioner of Education to be of enough value to justify their insertion in the Annual Report of his Office for the year 1886-87. They are here concisely presented at his request. In order that the statistics and discussions of the current year in another part of this volume may be considered by themselves and in their general relations to the other parts of the Report, these results are printed as a special article.

The annual reports of the Board of Health of the State of Illinois and the catalogues and announcements of the medical colleges in this country are the sources from which the facts have been drawn. A very careful comparison in many places between the statements of the Illinois board and those of the college publications has shown so much care and correctness, that the reports of that board, so far as they contain the facts, are used and quoted without demur.

For the careful collection of these facts through many years, and for their clear and logical presentation, the country owes a debt of gratitude to Dr. John H. Rauch, secretary of that board; yet this is only one of the many useful and continued services of that accomplished and indefatigable officer and physician.

When the Federal Census of 1880 announced that there were 85,671 physicians or alleged physicians in this country, or one to 584 of the entire population, it simply gave a definite form to a long-felt impression in most minds. That the medical profession in the United States was scandalously overcrowded was known long before that year; that it is so still, the comments and complaints of the medical journals every spring bear witness. The evil must be endured until in process of time effective measures are devised and applied for its correction; it will never cure itself, as long as human vanity, greed, and laziness are permitted to act unchecked.

Fortunately the facile descent toward the medical Avernus has awakened a good deal of professional and some public alarm; and, in consequence, medical licensing acts and other devices have been adopted in many States for the purpose of regulating the conduct, character, educational acquirements, and professional relations of medical men to the public.

The purpose of this paper is to show how medical colleges may co-operate in the good work of increasing the qualifications of medical graduates, and thereby preventing or hindering the entrance of incompetent or indolent persons into the medical profession.

The method here described is not new; it is in vogue in several colleges of medicine already with the happiest results, and only needs to be extended to all medical schools in the country to produce a most beneficial effect upon the number, quality, and value of aspirants for medical success.

The greater number of medical schools in the United States still pursue the ancient method of educating their students. This consists, essentially, of a requirement that the applicant for graduation shall have attended "two courses of lectures" upon the main topics included in medical training; but in practice these "two courses" are really one and the same course, given each year with but little variation.

A more modern and more sensible method is followed by the minority of our medical schools; these require, before graduation, attendance upon three courses of lectures, in which the subjects of instruction are arranged in such a way as to be graded in correspondence with the attainments and progress of the students.

I have taken the facts given in this article as to the numbers of matriculates and graduates of one hundred and twelve medical colleges existing in this country during the scholastic year 1885-86 from the reports of the Illinois Board of Health. I have grouped the colleges requiring three graded courses of instruction together, and those not so requiring also together; in the discussion of these groups, the graded group is entitled "A," and the other "B."

The period of time chosen covers five scholastic years; for each of these and for the quinquennial period the table on pp. 1024-27 gives the matriculates and graduates appertaining to each of the schools above indicated.

I do not mean to assert that all the schools in Group A required graded courses during the entire quinquennial period, but only that they so required in the last year of the period. Nor do I assert that all the schools in Group B are properly placed therein; but only that they appeared to me, upon a careful examination, to belong therein rather than in Group A. For errors of judgment in this respect I beg the indulgence of my readers.

Group A contains twenty-four "Regular" and five Homœopathic medical schools; Group B consists of sixty-three "Regular," eight Homœopathic, ten Eclectic, and two Physio-medical schools.

Having given the facts for each school and each year in detail, I now append a summary showing the number of matriculates in each year and for the entire period in each group in the several professional sects, if the latter term be allowable, and in all the schools considered together. Eighty-four per cent. of these students attended "Regular" schools, more than nine per cent. went to Homœopathic schools, and the rest mainly to Eclectic schools.

The matriculates decreased in number year after year until 1881-85, when the low point was reached; an upward tendency, noticeable in all the varieties of doctrine, began with 1885-86. This is true of both groups in general. The matriculates in the "Regular" schools in Group A were, however, least numerous in 1883-84, while the Homœopathic schools in the same group for the same year show their largest enrolment during the period. There is no doubt that the general population of the country increased as rapidly as usual during each year of the time under review, though the number of medical students fluctuated as indicated.

Summary of medical matriculates in the United States, for five years ending in 1885.

Years.	All schools.			Regular.			Homœopathic.			Eclectic.	Physio-medical.
	Groups A and B.	Group A.	Group B.	Groups A and B.	Group A.	Group B.	Groups A and B.	Group A.	Group B.	Group B.	Group B.

In order to direct attention to other points of interest, the concrete numbers of the summary under review are now transformed into percentages.

These show that the colleges included in Group A, when compared with those in Group B, gradually and slightly increased their proportion of matriculates; this is also true of both the "Regular" and the Homœopathic schools.

The proportion of Homœopathic matriculates in Group A is greater than that of "Regular" matriculates therein.

When one observes that, during the five years, seventy-nine medical students attended the repetition-course schools, while only twenty-one attended the graded-course schools, one can not avoid asking why such was the case? Of course many who attended schools in Group B did so because the schools were more numerous; but it is probable that a goodly number preferred them because they were thought to be less exacting of labor by their students. Men who desire to obtain a degree with the minimum of labor or delay are naturally repelled by the announcement of schools like those in Group A; like water, they flow in the direction of least resistance.

This summary does not indicate that degrees are obtained more easily in Group B than in Group A, but that some men prefer the group that seems to ask its students to spend less time, and, presumably, to take less pains at each step in their progress.

Per cent. of matriculates in medical schools of the two groups for five years.

Years.	All schools.		Regular.		Homœopathic.		Eclectic.	Physio-medical.
	Group A.	Group B.	Group A.	Group B.	Group A.	Group B.	Group B.	Group B.
1881-82.	19.9	80.1	20.8	79.2	25.7	74.3	100.0	100.0
1882-83.	20.0	80.0	20.9	79.1	24.7	75.3	100.0	100.0
1883-84.	20.3	79.7	20.9	79.1	24.0	72.0	100.0	100.0
1884-85.	22.2	77.8	22.9	77.1	28.5	71.5	100.0	100.0
1885-86.	22.5	77.5	23.4	76.6	29.6	70.4	100.0	100.0
Five years.	20.9	79.1	21.7	78.3	27.2	72.8	100.0	100.0

The next summary shows for each year, for the five years, for all kinds of schools, for each kind, and for each group, the number of graduates—that is, the number entering the profession of medicine and surgery.

The year 1884-85 is low tide in this respect, as in the matter of matriculations.

Eighty-four per cent. of the graduates were from "Regular" schools, nearly ten per cent. from Homœopathic schools, and the rest mainly from Eclectic schools. For most of the increase of the medical profession for which the schools are accountable, those teaching the "Regular" or Innominate doctrines are shown to be directly responsible.

Summary of medical graduates in the United States, for five years ending in 1886.

Years.	All schools.			Regular.			Homœopathic.			Eclectic.	Physio-medical.
	Groups A and B.	Group A.	Group B.	Groups A and B.	Group A.	Group B.	Groups A and B.	Group A.	Group B.	Group B.	Group B.
1881-82	4, 284	664	3, 620	3, 626	568	3, 058	368	96	272	280	10
1882-83	4, 053	707	3, 346	3, 364	617	2, 747	457	90	347	235	17
1883-84	5, 905	642	3, 263	3, 269	549	2, 720	404	93	311	225	7
1884-85	3, 601	624	2, 977	3, 072	528	2, 544	336	96	240	181	12
1885-86	3, 793	660	3, 133	3, 189	556	2, 633	375	104	271	201	28
Five years.	19, 636	3, 297	16, 339	16, 520	2, 818	13, 702	1, 920	479	1, 441	1, 122	74

The proportion of graduates from the groups is shown in the percentage table next presented. Eighty-three per cent. graduated from schools in Group B, as against seventeen per cent. from schools in Group A. This proportion holds for the "Regular" graduates; but twenty-five per cent. of the Homœopathics graduated from schools in Group A.

This is a very serious matter indeed, when properly considered. The legitimate, ascertained, and best-educated element in the increase of the medical profession, during the five years under review, graduated from schools whose standard of attainment was much lower than that recognized in any foreign country, and lower even than the standard set by many schools in this country.

Per cent. of graduates from medical schools of the two groups for five years.

Years.	All schools.		Regular.		Homœopathic.		Eclectic.	Physio-medical.

1881-82	15.5	84.5	15.7	84.3	26.1	73.9	100.0	100.0
1882-83	17.4	82.6	18.3	81.7	20.6	79.4	100.0	100.0
1883-84	16.4	83.6	16.8	83.2	23.0	77.0	100.0	100.0
1884-85	17.3	82.7	17.2	82.8	28.6	71.4	100.0	100.0
1885-86	17.4	82.6	17.4	82.6	27.7	72.3	100.0	100.0
Five years	16.8	83.2	17.1	82.9	24.9	75.1	100.0	100.0

Finally, we must consider the proportion of graduates to matriculates for the period under review.

Somewhat more than a third of the medical students became doctors of medicine; but the proportion of graduates to matriculates in Group A was twenty-seven per cent., a little more than a fourth, while in Group B it was thirty-five per cent., or more than a third. If the proportion of graduates in Group B had been the same as in Group A, the number of graduates therefrom would have been about 12,500 instead of about 16,300, as heretofore shown. If, on the other hand, the graduates in Group A had been as numerous in proportion as in Group B, they would have risen from about 3,300 to about 4,300.

The rigid application of the requirement for a graded course of instruction for three years by all medical colleges during the five years under present consideration, would have resulted in reducing the number of graduates from about 19,600 to about 15,800. Whether this diminution of graduates would be beneficial as a whole to the medical profession, is a subject upon which men may differ; but there is no question that the graded course would tend to raise the standard of qualifications needed for graduation, and would supply a better quality of graduates for employment in the work of the medical practitioner.

Per cent., for the five years, of medical graduates to medical matriculates in the United States.

IN BOTH GROUPS.

Years.	All schools.	Regular.	Homœopathic.	Eclectic.	Physio-medical.

CHAPTER XX.

INDEX TO THE PUBLICATIONS OF THE UNITED STATES BUREAU OF EDUCATION, FROM 1868 TO 1887.

For nearly twenty years this Office has been issuing annual and special reports, circulars of information, and other occasional publications for the information of Congress and of the public. These documents now number some twenty-five volumes and comprise as many thousand pages; reference to their contents has become somewhat of a task; and the lapse of time makes it advisable that many bibliographical data respecting them should be committed to print before they are entirely lost.

In order, therefore, to render reference to the contents of these publications easy, and to preserve useful memoranda respecting them, the accompanying list and index has been prepared.

LIST OF PUBLICATIONS.

I.—ANNUAL REPORTS.

Report of the Commissioner of Education, 1867-68. 8°, pp. xl + 856. Washington, 1868.

Special report of the Commissioner of Education on the condition and improvement of public schools in the District of Columbia. 8°, pp. 912. Washington, 1871.

Report of the Commissioner of Education for the year 1870. 8°, pp. 579. Washington, 1870.

Same for 1871. 8°, pp. 715. Washington, 1872.

Same for 1872. 8°, pp. lxxxviii + 1018. Washington, 1873.

Same for 1873. 8°, pp. clxxviii + 870. Washington, 1874.

Same for 1874. 8°, pp. clii + 935. Washington, 1875.

Same for 1875. 8°, pp. clxxiii + 1016. Washington, 1876.

Same for 1876. 8°, pp. ccciii + 942. Washington, 1878.

Same for 1877. 8°, pp. cevi + 644. Washington, 1879.

Same for 1878. 8°, pp. cci + 730. Washington, 1880.

Same for 1879. 8°, pp. cccxxx + 757. Washington, 1881.

Same for 1880. 8°, pp. cclxii + 914. Washington, 1882.

Same for 1881. 8°, pp. cclxxvii + 840. Washington, 1883.

Same for 1882-83. 8°, pp. cccxciii + 872. Washington, 1884.

Same for 1883-84. 8°, pp. cclxxi + 943. Washington, 1885.

Same for 1884-85. 8°, pp. cccxvii + 848. Washington, 1886.

Same for 1885-86. 8°, pp. xxi + 792. Washington, 1887.

II.—CIRCULARS OF INFORMATION.

Circular of information, August, 1870. pp. 70.—*Contents*: Illiteracy; derived from census tables of 1860; Educational statistics, translation of article by Dr. A. Fieker; Virchow on school-room diseases; Education of French and Prussian conscripts; School organization, etc.

Same, July, 1871. pp. 48.—*Contents*: Public instruction in Sweden and Norway; The "folkehoiskoler" of Denmark.

Same, November, 1871. pp. 14. Methods of school discipline.

Same, December, 1871. pp. 17. Compulsory education.

Same, January, 1872. pp. 43. German and other foreign universities.

Same, February, 1872. pp. 77.—*Contents*: Public instruction in Greece, the Argentine Republic, Chili, and Ecuador; Statistics respecting Portugal and Japan; Technical education in Italy.

Same, March, 1872. pp. 93.—*Contents*: Vital statistics of college graduates; Distribution of college students in 1870-71; Vital statistics in the United States, with diagrams.

- Circular of information, April, 1872. pp. 125. Relation of education to labor.
- Same*, June, 1872. pp. 22. Education in the British West Indies.
- Same*, July, 1872. pp. 62. The kindergarten.
- Same*, November, 1872. pp. 79. American education at the Vienna Exposition of 1873.
- Same*, 1, 1873. pp. 66. Historical summary and reports on the systems of public instruction in Spain, Bolivia, Uruguay, and Portugal.
- Same*, 2, 1873. pp. 30. Schools in British India.
- Same*, 3, 1873. pp. 118. College commencements for the summer of 1873, in Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, and Pennsylvania.
- Same*, 4, 1873. pp. 72. List of publications by members of certain college faculties and learned societies in the United States, 1867-72.
- Same*, 5, 1873. pp. 155. College commencements during 1873 in the Western and Southern States.
- Same*, 1, 1874. pp. 77. Proceedings of the Department of Superintendence of the National Educational Association, Washington, D. C. [1874].
- Same*, 2, 1874. pp. 56. Drawing in public schools; present relation of art to education in the United States.
- Same*, 3, 1874. pp. 87. History of secondary instruction in Germany.
- Same*, 1, 1875. pp. 114. Proceedings of the Department of Superintendence of the National Educational Association, Washington, D. C. [1875].
- Same*, 2, 1875. pp. 64. Education in Japan.
- Same*, 3, 1875. pp. 103. Public instruction in Belgium, Russia, Turkey, Servia, and Egypt.
- Same*, 4, 1875. pp. 16. Waste of labor in the work of education.
- Same*, 5, 1875. pp. 26. Educational exhibit at the International Centennial Exhibition, 1876.
- Same*, 6, 1875. pp. 203. Reformatory, charitable, and industrial schools for the young.
- Same*, 7, 1875. pp. 130. Constitutional provisions in regard to education in the several States.
- Same*, 8, 1875. pp. 15. Schedule for the preparation of students' work for the centennial exhibition.
- Same*, 1, 1877. pp. 28. Education in China.
- Same*, 2, 1877. pp. 77.—*Contents*: Public instruction in Finland, the Netherlands, Denmark, Württemberg, and Portugal; The University of Leipzig.
- Same*, 1, 1878. pp. 36. Training of teachers in Germany.
- Same*, 2, 1878. pp. 24. Elementary education in London.
- Same*, 1, 1879. pp. 21. Training schools for nurses.
- Same*, 2, 1879. pp. 192.—*Contents*: Proceedings of the Department of Superintendence of the National Educational Association, 1877 and 1879, Washington, D. C.; Proceedings of the conference of college presidents and delegates, Columbus, Ohio, December, 1877.
- Same*, 3, 1879. pp. 37. Value of common school education to common labor. [Reprinted from Annual Report, 1872.]
- Same*, 4, 1879. pp. 49. Training schools of cookery.
- Same*, 5, 1879. pp. 37. American education as described by the French commission to the international exhibition of 1876.
- Same*, 1, 1880. pp. 27. College libraries as aids to instruction.
- Same*, 2, 1880. pp. 112. Proceedings of the Department of Superintendence of the National Educational Association, Washington, D. C., 1880.
- Same*, 3, 1880. pp. 96. Legal rights of children.
- Same*, 4, 1880. pp. 106. Rural school architecture.
- Same*, 5, 1880. pp. 26. English rural schools.
- Same*, 6, 1880. pp. 219. Instruction in chemistry and physics in the United States.
- Same*, 7, 1880. pp. 36. The spelling reform.
- Same*, 1, 1881. pp. 26. Construction of library buildings.
- Same*, 2, 1881. pp. 22. Relation of education to industry and technical training in American schools.
- Same*, 3, 1881. pp. 79. Proceedings of the Department of Superintendence of the National Educational Association, New York, 1881.
- Same*, 4, 1881. pp. 144. Education in France.
- Same*, 5, 1881. pp. 47. Causes of deafness among school children and the instruction of children with impaired hearing.
- Same*, 6, 1881. pp. 29. Effects of student life on the eyesight.
- Same*, 1, 1882. pp. 23. Inception, organization, and management of training schools for nurses.

- Circular of information, 2, 1882. pp. 112. Proceedings of the Department of Superintendence of the National Educational Association, Washington, 1882.
- Same*, 3, 1882. pp. 67. University of Bonn.
- Same*, 4, 1882. pp. 37. Industrial art in schools.
- Same*, 5, 1882. pp. 14. Maternal schools in France.
- Same*, 6, 1882. pp. 63. Technical instruction in France.
- Same*, 1, 1883. pp. 46. Legal provisions respecting the examination and licensing of teachers.
- Same*, 2, 1883. pp. 30. Co-education of the sexes in the public schools of the United States.
- Same*, 3, 1883. pp. 81. Proceedings of the Department of Superintendence of the National Educational Association, Washington, D. C., 1883.
- Same*, 4, 1883. pp. 82. Recent school-law decisions.
- Same*, 1, 1884. pp. 11. Meeting of the International Prison Congress at Rome.
- Same*, 2, 1884. pp. 184. The teaching, practice, and literature of shorthand. [Second and enlarged edition.]
- Same*, 3, 1884. pp. 99. Illiteracy in the United States. With appendix on national aid to education.
- Same*, 4, 1884. pp. 176. Proceedings of the Department of Superintendence of the National Educational Association, Washington, D. C., 1884.
- Same*, 5, 1884. pp. 28. Suggestions respecting the educational exhibit at the New Orleans Exposition, 1884-85.
- Same*, 6, 1884. pp. 90. Rural schools: progress in the past; means of improvement in the future.
- Same*, 7, 1884. pp. 158. Aims and methods of the teaching of physics.
- Same*, 1, 1885. pp. 207. City school systems in the United States.
- Same*, 2, 1885. pp. 206. Teachers' institutes.
- Same*, 3, 1885. pp. 55. Review of the reports of the British royal commissioners on technical instruction, with notes.
- Same*, 4, 1885. pp. 56. Education in Japan.
- Same*, 5, 1885. pp. 183. Physical training in American colleges and universities.
- Same*, 1, 1886. pp. 78. Study of music in public schools.
- Same*, 2, 1886. pp. 91. Proceedings of the Department of Superintendence of the National Educational Association, Washington, D. C., 1886.
- Same*, 1, 1887. pp. 89. The College of William and Mary.
- Same*, 2, 1887. pp. 299. Study of history in American colleges and universities.
- Same*, 3, 1887. pp. 200. Proceedings of the Department of Superintendence of the National Educational Association, Washington, D. C., 1887.

III.—MISCELLANEOUS PUBLICATIONS.

- Report on school architecture, and plans for graded schools. pp. 136. [Reprinted from Annual Report, 1868.]
- Suggestions for a free school policy for United States land grantees. pp. 6. 1872.
- Statement of the theory of education in the United States, approved by many leading educators. pp. 22. 1874.
- National Bureau of Education; its history, work, and limitations. pp. 16. 1875.
- Educational conventions and anniversaries, 1876. pp. —. 187—.
- International conference on education held in Philadelphia, in connection with the international exhibition of 1876. pp. 92. 1877.
- List of public school officials in the States and Territories of the United States, 1875. pp. 62. 1875.
- Manual of common native trees of the northern United States. pp. 23. 1877.
- Are the Indians dying out? pp. 36. 1877.
- International educational congress to be held at Brussels, Belgium, August, 1880. pp. 10. 1880.
- Indian school at Carlisle barracks. pp. 5. 1880.
- Industrial education in Europe. pp. 9. 1880.
- Vacation colonies for sickly school children. pp. 4. 1880.
- Progress of western education in China and Siam. pp. 13. 1880.
- Educational tours in France. pp. 4. 1880.
- Medical colleges in the United States. pp. 3. 1881.
- Comparative statistics of elementary education in fifty principal countries. (Folding sheet.) 1881.
- Fifty years of freedom in Belgium; Education in Malta; Third international geographical congress at Venice, 1881; Illiteracy and crime in France; School savings banks; Education in Sheffield. pp. 8. 1881.
- Library aids. pp. 10. 1881.

- Recognized medical colleges in the United States. pp. 4. 1881.
 Discipline of the school. pp. 15. 1881. [Reprint of Circular of information. November, 1871.]
 Education and crime. pp. 10. 1881.
 Instruction in morals and civil government. pp. 4. 1882.
 Comparative statistics of elementary, secondary, and superior education in sixty principal countries. (Folding sheet.) 1882.
 National pedagogic congress of Spain. pp. 4. 1882.
 Natural science in secondary schools. pp. 9. 1882.
 High schools for girls in Sweden. pp. 6. 1882.
 Buffalini prize. pp. 5. 1883.
 Education in Italy and Greece. pp. 8. 1883.
 Answers to inquiries about the United States Bureau of Education. pp. 29. 1883.
 Planting trees in school grounds. pp. 8. 1883.
 Southern exposition of 1883-84, Louisville, Ky. (Two pamphlets relating to the exhibit of the United States Bureau of Education.) pp. 17, 1883; pp. 7, 1884.
 Preliminary circular respecting the exhibition of education at the World's Industrial and Cotton Centennial Exposition. pp. 11. 1884.
 Report of the director of the American School of Classical Studies at Athens, for the year 1882-83. pp. 13. 1884.
 Building for the children of the South. pp. 16. 1884.
 Planting trees in school grounds, and celebration of Arbor Day. pp. 8+64. 1885.
 International educational congress at Havre. pp. 6. 1885.
 Statistics of public libraries in the United States. pp. 93. 1886.

IV.—SPECIAL REPORTS.

- Technical instruction. Special report, 1869. 8°, pp. 33-784. Washington [1870].
Note. First edition incomplete, printed pursuant to a call of House of Representatives, Jan. 19, 1870. Second edition published as vol. xxi of Barnard's Journal of Education. pp. 807.
 Contributions to the annals of medical progress and medical education in the United States before and during the War of Independence. By Joseph M. Toner. 8°, pp. 118. Washington, 1874.
 Historical sketch of Mount Holyoke Seminary. By Mary O. Nutting. Edited by F. B. Hough. 12°, pp. 24. Washington, 1876.
 Historical sketch of Union College. By F. B. Hough. 8°, pp. 81. Washington, 1876.
 Public libraries in the United States of America, their history, condition, and management. Part I. pp. xxxv + 1187. Edited by S. R. Warren and S. N. Clark; Part II. pp. 89. Rules for a printed dictionary catalogue. By C. A. Cutter. 8°. Washington, 1876.
 Contributions to the history of medical education and medical institutions in the United States of America, 1776-1876. By N. S. Davis. 8°, pp. 60. Washington, 1877.
 Sketch of the Philadelphia Normal School for Girls. 8°, pp. 39. Washington, 1882.
 Historical sketches of the universities and colleges of the United States.¹ Edited by F. B. Hough. (History of the University of Missouri.) 8°, pp. 72. Washington, 1883.
 Industrial education in the United States. 8°, pp. 319. Washington, 1883.
 Art and industry.—Industrial and high art education in the United States. By I. Edwards Clarke. Part I. Drawing in the public schools. 8°, pp. cclix + 842. Washington, 1885.
NOTE.—There were two other editions, with slightly varying titles; one ordered by the Senate, the other by Congress.
 Outlines for a museum of anatomy. By R. W. Shufeldt. 8°, pp. 65. Washington, 1885.
 Educational exhibits and conventions at the World's Industrial and Cotton Centennial Exposition, New Orleans, 1884-85. 8°, pp. 962, foot pagination.² Washington, 1886.

Contents. Part I. Catalogue of exhibits. pp. 240.

Part II. Proceedings of the International Congress of Educators. pp. 576.

Part III. Proceedings of the Department of Superintendence of the National Educational Association, and addresses delivered on Education Days, 1885, N. O. pp. 148.

¹ It was proposed to publish, during the Centennial year, a series of histories of colleges, universities, professional schools, and special schools of science, but the following named only were issued: Historical sketch of Mt. Holyoke Seminary; Historical sketch of Union College; and the History of the University of Missouri, as above.

² From which all quotations are made.
