REPORT OF THE COMMISSIONER OF EDUCATION.

CHAPTER I.

THE COMMISSIONER'S STATEMENT.

The work of the Office—The Museum—The Library—Publications of the Office—Plan and scope of the Annual Report—History of American education—The College of William and Mary—Report on the Study of History in American Colleges and Universities—Opinions of the recent work of the Bureau—Alaska: Sketch of the history, geography, etc., of the Territory; civil government; education in Alaska; tour of inspection; Metlakatla; plan of education; present condition of the schools; what provision is necessary for school-houses; application of school fund for the present year; future policy of the Government—Removal of the Office—Delay in the publication of the Report—Conclusion.

DEPARTMENT OF THE INTERIOR,
BUREAU OF EDUCATION,
Washington, D. C., September 30, 1887.

SIR: I have the honor to submit the following report of the operations of this Office for the year ending June 30, 1887:

I was appointed by the President on the 3d and confirmed by the Senate on the 5th of August, 1886; but having obtained your permission to arrange my private business before entering upon my duties, I did not assume personal charge of the Office until the 27th of September following.

THE WORK OF THE OFFICE.

Upon assuming charge of the Office, after consultation with you and an examination into its condition and its business methods, I deemed it best to reduce the number of divisions into which it had been organized from seven to three, called, respectively, the Division of Records, the Division of the Library and Museum, and the Division of Statistics. This consolidation was made with the purpose of making the organization more simple, the responsibility of the employés more explicit, the service more efficient, and the work more systematic, prompt, and accurate.

The Division of Records is charged with the correspondence, indexing and filing of all communications, and the distribution of the publications of the Office and other public documents.

The Library and Museum Division is charged with the care of all the books, pamphlets, journals, apparatus, and other articles embraced in these collections.

The Division of Statistics is charged with the collection, arrangement, and comparison of statistics for the Annual Report and other publications of the Office, and with their preparation for publication.

To the supervision of each of these divisions was assigned an experienced chief, who became responsible for the proper execution and dispatch of its work. This plan has worked admirably, and has enabled the Office to complete much work previously unfinished, to respond to all the calls made upon it for information, and to perform promptly the routine duties assigned to it by law.

During the year this Office has received, written letters, 11,006; acknowledgments, 43,990; documents, 4,825; and 20,000 replies to statistical forms of inquiry; and has sent out 19,354 written letters and distributed 218,526 copies of documents. The statistical forms related to the Report for 1885-86, and the result appears in the appendices to the volume for that year, recently completed.

The documents received, above mentioned, comprising school reports, educational journals, treatises and other works and pamphlets on educational subjects, have been catalogued and filed in the Library and Museum Division, wherein the card catalogue of the general collection of books has been carried very far towards completion, and the special catalogue of the articles in the museum prepared.

THE MUSEUM.

This collection of educational apparatus and appliances has never received the attention which its value and extent demand, partly on account of the want of space for an adequate display of the same. Desiring that it should be made serviceable to some extent, I have caused a selection of the articles to be made, have made some additions in order to complete the collection, and have had the same catalogued, cased, and displayed in accordance with the most approved methods, following the general plan furnished by the National Museum. Visitors to this Office will find this collection of infinitely greater value than ever before for educational purposes, on account of the ease with which they can have access to the articles for examination, comparison, and study.

The museum, as now arranged, will be a genuine surprise to almost any one not connected directly with the Office.

That portion now exhibited contains approximately two thousand five hundred objects and series of objects.

It has been suggested that the museum, on account of the want of room for its proper display, and the want of means to bestow upon it that care and attention which are necessary for its preservation, should

be deposited in the National Museum until proper accommodation shall be provided for this valuable collection.

For many reasons this arrangement would be a subject of regret to the friends of education, who have so zealously and carefully watched and fostered the growth of this valuable addition to the educational facilities of the Bureau, and the idea could only be entertained on account of the great necessity that exists for its preservation.

THE LIBRARY.

The value of the library is well known to educationists of every grade, and it has been used during the past year by a number of persons engaged in the investigation of educational subjects. Inquiries are frequently made upon these subjects by correspondents, not only in the United States, but in foreign countries, for information which can not be obtained elsewhere.

It now contains 19,200 volumes and 60,000 pamphlets, besides many thousand duplicates which are used for exchange and distribution. During the year 1,700 volumes and 15,000 pamphlets were added to the library, indexed, and filed; 8,000 cards for the catalogue were written, and over 300 cards giving references to investigators on various topics were prepared. Some of these cards were the result of very elaborate research, and were prepared with great care and labor.

Many of the books in the library and a very large portion of the articles in the museum are the gifts of foreign Governments and of native and foreign authors and inventors, and are pecuniarily of great value. These parts of the collection could not be duplicated if scattered or destroyed. So valuable a collection should be deposited in a fire-proof building, and I trust that the time is approaching when the claims of this Office for a building suitable for its purposes and capable of preserving these collections will be recognized by the Government.

A complete Index to the publications of the Bureau since its foundation to the close of the fiscal year now under review, has also been prepared. This will add greatly to the convenience of those who may wish to examine these publications. It will be found in Chapter XXII of this volume.

It is intended that these catalogues and indexes shall hereafter contain all additions as soon as made.

PUBLICATIONS OF THE OFFICE.

Upon taking charge of the Office I found that the Annual Report for 1884-85 was not completed, and that no steps had been taken for the preparation of the Report for 1885-86.

Under these circumstances it was deemed best to forward the completion of these Reports and other unfinished work, so that hereafter the preparation of the Annual Reports would begin immediately after the end of the fiscal year.

In pursuance of this plan, the Report of 1884-85 was completed and sent to the printer in January, 1887, and has been published and distributed. The Report of 1885-86 was then taken up and pushed forward rapidly, and was placed in the hands of the printer on the 15th of last June, and will be ready for distribution soon after the meeting of Congress in December.¹

In addition to the preparation and publication of these Reports, much other unfinished work was completed. Circular of Information No. 1, 1886, respecting the Study of Music in the Public Schools, was completed and published; and the Proceedings of the Department of Superintendence of the National Educational Association for the year 1885-86 was edited and published as a circular, in accordance with the usages of the Office.

The Special Report of Education at the New Orleans Exposition, consisting of three parts, was also printed and distributed; and the second part of the Special Report on Fine and Industrial Art has been revised, and a small part of it printed during the year.

This work was undertaken in response to a resolution of the Senate, dated February 2, 1880, directing the Secretary of the Interior, through the Bureau, to "furnish the Senate with a statement of all the information relative to the development of instruction in drawing as applied to the industrial or fine arts in the colleges of agriculture and the mechanic arts, and in the public schools and other institutions of the country, with special reference to the utility of such instruction in promoting the arts and industries of the people."

Part I of this work was completed and published in 1886. I deem it important that the other parts of this work should be finished at an early period, in order that no further delay may occur in laying the information in the possession of the Office before the Senate. The work has been in charge of Mr. I. Edwards Clarke since its inception. The second part will cover at least one thousand pages, and there are to be two additional volumes.

The Special Report on Indian Education and Civilization, undertaken in response to a resolution of the Senate dated February 23, 1885, was continued and completed under the editorial charge of Miss Alice C. Fletcher, assisted by a portion of the clerical force in the Division of Statistics. This volume is now in the hands of the printer, and will cover at least seven hundred printed pages.

In response to a general expression from the correspondents of the Office, the list of libraries, other than private, containing over three hundred volumes, which appeared in the Report for 1884-85, was also reprinted and largely distributed.

During the year Circulars Nos. 1 and 2 have been prepared and published. The first, containing a historical account of the College of William and Mary in Virginia, was prepared by Prof. Herbert B.

¹ This Report was printed and published in the month of January, 1883.

Adams, Ph. D., associate professor of history in Johns Hopkins University, and has been received with singular favor. This forms the first of a series of historical monographs which I have made arrangements to publish at suitable times. Considerable work in this direction has been done during the year with reference to the history of higher education in the universities and colleges of the older States in the Union, with special reference to the period anterior to the war of the Revolution.

Circular No. 2 is a historical summary respecting The Study of History in the Colleges and Universities of the United States, and has elicited great interest and commendation.

The Proceedings of the Department of Superintendence of the National Educational Association, held in this city in March, 1887, were prepared and edited as Circular No. 3, and are now in the hands of the printer, to whom it was delivered in the month of July, 1887.¹

THE PLAN AND SCOPE OF THE ANNUAL REPORT.

Upon examining the previous Reports of the Office, it seemed to me that, without violating the spirit or lessening the usefulness of the series, it was possible to increase the promptness of publication, the variety of contents, and the value of deductions in future issues by suitable changes in the method of their preparation and the details of their arrangement.

These changes may be summarized by saying that they contemplate the absolute avoidance of duplicate mention of facts, the omission of columns in the statistical tables which experience has shown can not be filled, the union and printing together of text and tables wherever relating to the same subject, and the addition of many convenient ratios and comparisons.

Following the lines of this plan, in preparing for the Report of 1885-86, the forms of inquiry were systematically revised, and in many cases simplified, though new topics were introduced wherever thought advisable. This process was continued in the preparation for the present Report, and the forms, printed in a convenient shape, were distributed to all the systems and schools upon the lists of the Office, amounting to nearly fifteen thousand.

The current literature of education was carefully examined, both for facts and opinions of value. The printed reports of States and cities, the catalogues and circulars of public and private schools of every grade, and other documents, were also examined with care for suitable material.

Having determined what facts could be best stated in tabular form, blank sheets for such tables were prepared in advance, and the names and addresses of schools were inserted therein. When the forms were received back from our correspondents, the statistical facts therein

¹ This Circular was printed and published in May, 1883.

given were promptly tabulated as received; meanwhile such portions of the text as did not require consultation of the tabular matter were hastened. As now presented, it is believed that the statistics relating to public and private instruction of all grades and kinds in the United States will be found more thoroughly systematized and more fully analyzed than heretofore.

The statistics of State and Territorial systems previously published by the Office, somewhat remodelled and extended in my first Report, are now further modified, so as to render the tabulated statements shorter and more compact and the discussion thereof more plain and convenient. While the concrete facts are thus presented, the ratio-tables and other comparative statistics then begun have been correspondingly extended and re-arranged. The main lines, now as then, are to illustrate and define (1) the increase or decrease during the year of each item for each State; (2) the ratio which each item in each State bears to every item in the same State, thus enabling the educational status of each State to be compared with that of every other; (3) tabular summaries by geographical sections, thus enabling broader comparisons and generalizations to be instituted.

Instead of depending upon the kindness and taking the time of correspondents by asking them to supply these ratios and comparisons, I have had them calculated in this Office according to carefully considered rules; in short, the object has been to give the information itself instead of the materials therefor, and to present accurate and complete statistics on a uniform basis.

The Report for 1885-86 presented these features mainly for State systems; in the present volume the work of improvement on the lines referred to above has been continued and enlarged. For example, the most important difference in the method of presenting the statistics of city and town systems in the Reports for 1885-86 and 1886-87 consists in the introduction in the latter of a comparative table similar in purpose to those described in the preceding paragraphs respecting State systems. A short account of the modifications introduced in this part of this Report is not out of place here.

The statistics have been extended to those cities whose population is 4,000 or more. The census of 1880 made that number the dividing line between the urban and the rural population, and this standard has been adopted as the lowest limit of population of "cities" by this Bureau. Though only a single column has been added to the table of statistics, the value of the figures there shown is vastly increased by the deductions drawn from them in the comparative table that follows.

In the blanks sent out for 1885-86 superintendents were asked to state "the average number of scholars per teacher;" the "average cost per capita of pupils in average attendance, based upon cost of supervision and instruction," and upon "incidental and contingent expenses;" and the "tax for school purposes upon the total property,

assessed and estimated." All these questions are omitted in the inquiries for the 1886-87 Report. Instead, all these calculations and others of a similar nature are made in this Office, thus insuring uniform methods of computation.

Further, the population between the ages of 6 and 14 years has been determined in each case, and averages are made upon that basis, as well as upon the average attendance upon the schools. For purposes of comparison upon equal terms this is absolutely necessary, since the "legal school age" is so variable as to make comparison impossible unless uniform bases were established.

The new tables show the percentage of "enrolment to population 6 to 14;" of "average daily attendance to population 6 to 14, and to enrolment;" the "average number of days that each person between the ages of 6 and 14 has been instructed;" the "average number of days of attendance of each pupil enrolled;" the "number of sittings for each 100 pupils enrolled and for each 100 pupils in average attendance;" the "average number of sittings to a building;" "the number of pupils in average attendance to each teacher;" "ratio of male teachers to whole number;" "ratio of high-school enrolment to total enrolment;" "ratio of private school enrolment to total public and private school enrolment;" "ratio of total public and private enrolment to population 6 to 14;" "number of volumes in libraries to each 100 pupils in average attendance;" "assessed value of property per capita of population 6 to 14;" "value of school property per capita of population 6 to 14 and of average attendance;" "ratio of value of school property to total assessed valuation;" "amount raised by city tax per capita of population 6 to 14 and of average attendance;" "ratio of amount raised by city or town tax to total assessed valuation;" "salaries of superintendents and teachers per capita of population 6 to 14 and of average attendance;" and finally, "ratio of salaries of superintendents and teachers to total assessed valuation."

The several instrumentalities for the training of teachers are carefully considered and represented in Chapter VI. In addition to the public normal schools and to a class of private schools which make the training of teachers their principal work, the summaries of pupils reported in the normal courses of secondary schools and colleges are included in the chapter, so that the general view of normal-school instruction may be as complete as heretofore.

On the other hand, care has been taken in other parts of the volume to display the amount and statistics of normal teaching afforded in each secondary or superior school, and copious cross-references are made wherever necessary.

Kindergartens, of which detailed tables were omitted in the Report for 1884-85, were carefully tabulated in my first Report, and similar tabulations appear in this volume (Chapter VII). The application

of kindergarten methods to the instruction of the blind and of other special classes is set forth in connection with other related facts.

The statistics of secondary instruction (Chapter VIII) have been rendered more complete in regard to public high schools, while the subdivisions adopted for the table correspond more exactly to the present condition of the schools considered, and therefore better facilitate the study of the details.

The changes in the forms and methods of the classification adopted are explained in the remarks relating to these schools. The whole subject was considered from every practicable point of view, and the best result attainable has been presented. It should not be understood, however, that the scheme here indicated is not open to future modifications; on the contrary, the experience gained during the year under review will be used to improve and extend the subject in future volumes.

Those familiar with the educational history of the past few years can not fail to be impressed with the evidence it affords of vital force in the superior institutions of learning in the United States, and of the great and growing interest manifested by foreign students of education in the details of their organization, equipment, and conduct.

The number and varied character of these institutions make it exceedingly difficult to devise a scheme suited at once to the just representation of individual institutions and to the record of particulars common to a class. The former is necessary to give a fair idea of the genius and growth of our institutions, and the latter to show their relation to educational problems of universal moment.

Two departures from the scheme formerly employed in this division of the Report have been made, namely, the introduction of Tables 43 and 44, presenting in a single view all the departments of State universities and foundations of private origin which consist of groups of related faculties or schools, and the removal from Table 48 of those departments whose statistics could not be separated from those elsewhere tabulated. These changes are fully explained in Chapter IX.

The treatment of details here, as in the division of secondary instruction, has been determined by the consideration of the information of chief importance to those charged with the duty of promoting the educational interests of the country.

Training for special pursuits and the education of special classes are considered with such fulness as is consistent with their relations to other parts of the field of instruction.

The section relating to libraries (Chapter XVIII) is much enlarged since my last Report. The general table of libraries, printed in the Report for 1884-85, was taken as the point of departure, and the tabulated statistics presented in this volume are the result of three processes, viz.: (1) the elimination of libraries connected with schools and systems mentioned in other parts of the volume; (2) the adding of all libraries discovered since the publication of that list; and (3) the classification of libraries having one thousand or more volumes into seven divisions,

according to the nature of their support and the conditions appended to their use. Summaries of libraries connected with schools and systems treated in other parts of this Report present the reader with the general facts useful for geographical and chronological comparison.

Chapter XXII contains a list of the publications of this Bureau from its origin in 1867 to the year covered by this volume, and an alphabetical index to their contents. This index is intended to render the use of these publications more easy when they are accessible, and to save the time of investigators and applicants when they do not possess the documents themselves.

The general condition and progress of education during the year under review thus set forth is discussed and exemplified in connection with the tables and statistics above described, and needs no further exemplification here. An examination of these discussions, etc., will show that the conditions and progress heretofore characteristic of American education have been, in general, maintained during the year 1886-87. There may have been here and there retrogressions and reactions, but these are more than balanced by healthy growths and judicious improvements. The subjects that attracted the attention of the profession in the year 1885-86 still continue to be the main objects of interest in the following year.

Among notable events of the year in the educational world may be mentioned the celebration by Harvard University of the two hundred and fiftieth anniversary of its foundation; the formal assumption by the corporation of Yale College of the name of "Yale University," as more exactly expressing the extent and importance of its present work in education; the centennial celebration of the incorporation of Columbia College, and the opening by that institution of its "School of Library Economy," and the various experiments, public and private, instituted for the introduction and application of manual and industrial training in the schools, both public and private.

HISTORY OF AMERICAN EDUCATION.

The Bureau of Education, with your approval, has entered upon an important line of educational inquiry. It has undertaken to investigate the history of American education from its earliest beginnings. The approaching Centennial of the United States Government under the Constitution renders such an historical review of the educational progress of the whole country both fitting and desirable. Our States will be stimulated to greater individual activity in the promotion of sound learning by a comparative history of what has been already accomplished.

THE COLLEGE OF WILLIAM AND MARY.

This new work of inquiry was begun in a very modest way by a study of the history of the College of William and Mary, the oldest collegiate institution of the South. At Williamsburg, the old capital of Virginia,

were trained many of the statesmen of the Revolutionary period, men who devised the so-called "Virginia plan," upon which our present Federal Constitution is based. George Washington was for many years the Chancellor of this famous college, and Thomas Jefferson and John Marshall were among its most distinguished sons. The influence of William and Mary College upon Southern education was carefully traced out, and the results of the inquiry were published as Circular of Information No. 1, 1887, a monograph of ninety pages, which has attracted great interest and favorable mention in the North and West, as well as at the South. The subject of Southern educational history has been so long neglected, and contains so much of real value, that the friends of American education, irrespective of section, are well pleased to have systematic inquiries extended into that part of our common country.

The precise scope of the above monograph can be quickly perceived from the following letter which was addressed by me to you.

DEPARTMENT OF THE INTERIOR,
BUREAU OF EDUCATION,
Washington, D. C., January 20, 1887.

The Honorable THE SECRETARY OF THE INTERIOR,
Washington, D. C. :

SIR: The history of the higher education in the United States deserves organized inquiry and national attention. The origin, development, academic status, and practical usefulness of many of our older and better institutions of learning are scarcely known beyond their own scholastic environment. Documentary and manuscript material for such educational history and statistics is abundant, although often widely scattered, as will be seen by an examination of the bibliography appended to the present sketch.

The College of William and Mary, founded in 1693 by royal grant, and long supported by popular legislation in Virginia, has been suffered to decline almost to ruin since the civil war, which destroyed the greater part of its property. The oldest college in the South, in fact the oldest in the country, with the exception of Harvard University, has been left to decay, while the latter institution, with which William and Mary College used to share the annual income of the bequest by Robert Boyle, the English philosopher, has lately celebrated its 250th anniversary amid general rejoicing, with the President of the United States and representatives of American and European universities to do honor to the occasion. The old college at Williamsburg, which gave Washington his first degree as civil engineer, and to which he gave his last public service as chancellor, the college which trained in law and politics Thomas Jefferson, Governor Randolph, Chief Justice Marshall, and nearly all of the Virginia statesmen of the Revolutionary and formative periods in our Federal history, has not now a single student. Its classic halls are closed and deserted. From a once flourishing faculty, which early and ably represented both history and political science, with other liberal arts, only the president, who is also professor of mathematics and physics, now remains. At the opening of every academic year, in October, Doctor Ewell causes the chapel bell to be rung, reminding Williamsburg that the ancient college still lives. To friends of the higher education in all of our States this fact will echo as a note of warning against public neglect and legislative indifference toward higher institutions of learning.

The present monograph has been prepared by Dr. Herbert B. Adams, the head of the department of history and political science at the Johns Hopkins University in Baltimore, in connection with his more extended inquiry for the Bureau of Education respecting the study of history in American colleges and universities.

This special inquiry is, however, not designed to be a special plea for the College of William and Mary, whose claim for reimbursement for damages suffered at the hands of undisciplined and straggling soldiers has more than once been presented to Congress, and more than once favorably reported by the Committee on Education and Labor, sustained by the opinions of lawyers and Federal officers. The primary objects of the present investigation have been to discover the historical beginnings of the higher education at the South; to trace the causes of the early prosperity of William and Mary College; to show its influence upon Virginia statesmen and the Southern States, its relation to the university ideas of Jefferson and Washington, and its significance to the whole country; to point out the causes of the decline of William and Mary College; to explain the rise of the University of Virginia, and the necessity of popular support for the higher education.

The most practical of all results from this historical study of William and Mary College is the suggestion of a possible revival in the city of Washington and throughout the country of the original Virginia idea of political education, which made Williamsburg a school of statesmen who were fitted in the college-capital to prepare the so-called "Virginia plan," from which our present Constitution grew. It is the idea of intimate organic connection between education and government in a municipal environment.

The promotion of political education by connection on the one hand with the people, and on the other with the administration of State and Nation, is an idea worthy of consideration in this centennial year of our Constitution, which was founded upon political wisdom and Federal democracy. In December, 1886, it was proposed, at a meeting in Philadelphia of delegates from the various States and Territories in the Union, to create a suitable memorial commemorative of the Constitution. Doctor Adams suggests a civil academy in the city of Washington for the practical training of representative college graduates appointed to government fellowships for two years from Congressional districts. He would combine, at the national capital, the West Point idea and the Williamsburg idea for the highest political education, and apply the results to the general improvement of civic life throughout the country. This eminent scholar writes with the freedom of one who understands as well as loves his subject; his article will commend itself to the hearty approval of all who are interested in American learning, in the history of our country, and in the faithful record of the first steps in American education.

In view of these facts I recommend the publication of the paper as a circular of information. I have the honor to be,

Very respectfully, your obedient servant,

N. H. R. DAWSON,
Commissioner.

L. Q. C. LAMAR,
Secretary.

Approved.

Encouraged by the favorable reception of the history of William and Mary College, I urged the author to prepare a similar but more extensive monograph upon Thomas Jefferson and the University of Virginia. Jefferson was the pioneer of university education and of free schools at the South. He advocated both as early as 1779, when serving as a visitor or trustee of William and Mary College. It has taken nearly a century for his noble scheme of public education for the whole people to find practical realization. Doctor Adams has traced the process of educational development in Virginia through various phases, and has discovered in the writings of Thomas Jefferson many early anticipations of what are now thought to be progressive ideas in pri-

mary, secondary, and higher education. A review of Jefferson's influence upon American institutions of learning can not fail to interest American educators in all parts of the country. His influence in this regard was not confined to a single State; it has pervaded the whole land; it is a vital element in modern educational democracy.

In connection with the monograph upon Jefferson and the University of Virginia, now in the hands of the Public Printer, sketches have been prepared of all the colleges of Virginia, with pictorial illustrations. This supplementary matter, together with the history of William and Mary College and of Jefferson's larger institution, will make the higher educational history of Virginia quite complete. The importance of this State as the original training-ground of many Southern statesmen and of teachers of every profession clearly justifies the historical attention bestowed upon it.

From such beginnings I have advanced gradually to the idea of an organized inquiry with regard to the history of American education, to be treated in State groups and in the following order:

1. *The Southern Atlantic States*, embracing Virginia, North and South Carolina, and Georgia. The work in this group of States has been already nearly completed by representatives of those States, working under the editorial direction of Dr. H. B. Adams, who himself elaborated the Virginia report as a model for the rest. These monographs upon the history of education in the older Southern States will all be ready for the Public Printer at an early date, and will be published during the current year. The historical interest discovered in the educational fields of North and South Carolina and Georgia is not surpassed even by Virginia, mother of institutions of learning, as well as of presidents and statesmen.

2. *The Northwest*.—The rapidly approaching centennial of the settlement of the old Northwest Territory made proper an immediate extension of these historical inquiries into that rich educational field. Prominent educators in each State in that territory have been engaged to co-operate in the prosecution of an organized inquiry under the general direction of this Bureau. Professor William F. Allen, of the historical department of the University of Wisconsin, has consented to be responsible for the educational history of that State; Professor George W. Knight, a graduate of the University of Michigan, and now professor of history in the State University of Ohio, will group the returns from Michigan, Ohio, and Illinois; and Professor Jas. A. Woodburn, of the State University of Indiana, will write the monograph upon that State. Illustrations will be secured to represent all the leading institutions.

3. *The Southwest*.—Justly balancing the inquiry into the educational history of the Old Northwest, I now propose, for the year 1889, a series of monographs upon the History of Education in the Southwest and Gulf States, embracing Kentucky, Tennessee, Alabama, Florida, Mississippi, Louisiana, Texas, Arkansas, Kansas, and Missouri. The successful pros-

ecution of this inquiry demands preliminary arrangement during the current year. Writers will be engaged and systematic investigations begun promptly under competent direction. The resources of this Bureau do not admit of a rapid extension of the work, but they are capable of achieving satisfactory results within limited areas in successive years. The method of handling a great subject, like American educational history, by State groups and State monographs seems to me not only best suited to the economic resources of the Bureau, but also quite in harmony with the State and local spirit of this country. The individual monographs can be freely distributed throughout all the States, but more especially in the sections most interested. The combined monographs will form a series of volumes representing handsomely and characteristically the various State groups already described.

4. *The New Northwest*.—After the completion of the work in the Southwest the inquiry will be extended into the great Northwest beyond the Mississippi River. This region of investigation will embrace Iowa, Minnesota, Dakota, Nebraska, Wyoming, and Montana.

5. *The Far West and the Pacific Slope* will conclude the pioneer work in American educational history.

6. *New England*.—Returning eastward, our inquiries will be centred for a time upon the Eastern States, considered as one educational group. Historical investigation in the older fields may well be undertaken after the pioneer work in the West and South has been completed. The educational history of New England is already comparatively well known, whereas in other sections of the country very little has been done toward the historical treatment of American education. All fair-minded and thoughtful men will rejoice to see work done first where it is most needed; and the older fields of American educational history will acquire fresh interest from the application of the comparative method of treatment.

7. *New York, New Jersey, Pennsylvania, Delaware, Maryland, and the District of Columbia* will form a convenient group for the conclusion of this educational series. Organized inquiry should finally be brought to bear upon the educational history of the city of Washington and upon an historical review of the scientific work of the United States Government, including the work of the Bureau of Education.

REPORT ON THE STUDY OF HISTORY IN AMERICAN COLLEGES AND UNIVERSITIES.

Public interest in American educational history has been tested by the Bureau of Education in a broader field than that opened by the monograph on William and Mary College. Immediately after the publication of the latter, the Bureau issued a larger monograph by the same author upon the Study of History in American Colleges and Universities. This report, while chiefly concerned with the origin and development of historical studies in American institutions of learning, gave

some account of representative American universities, notably of Harvard and Yale, Columbia and Cornell, the University of Michigan, and the new Johns Hopkins University, together with the principal American colleges for women. The following preliminary letter to you will explain concisely the general scope and purpose of the work:

DEPARTMENT OF THE INTERIOR,
BUREAU OF EDUCATION,
Washington, D. C., April 18, 1887.

The Honorable THE SECRETARY OF THE INTERIOR,

Washington, D. C. :

SIR: The accompanying monograph, prepared at the request of the Bureau of Education by Dr. Herbert B. Adams, of Johns Hopkins University, relates to the methods of studying history in American colleges and universities. The subject is treated from an historical point of view, and is a substantial contribution to the history of the higher education in the United States. Doctor Adams' sketch of William and Mary College, Circular of Information No. 1, 1887, with its practical suggestions for reviving political education throughout our country, was preliminary to this larger report, which is designed to promote the study of history as a basis for political science.

In December, 1885, a circular letter was issued from this Office, inquiring into the present condition of historical studies, not only in colleges and universities, but also in high schools, normal schools, institutes, academies, etc. The returns, while extensive, were on the whole unsatisfactory. In a few instances there were encouraging signs of good work in both higher and secondary training, but the general results indicated a serious absence of proper historical instruction in all grades of American education. By my advice the tabulation of statistical returns was restricted to institutes of the college and university grade. The question of secondary education in history demands special treatment and a study of the best methods now in use in the German gymnasia, the French lycées, and the English public schools.

From the unsatisfactory nature of the great mass of statistical returns, Doctor Adams was driven to another method of treating his subject—to a descriptive statement of the best experience of a few representative institutions in different parts of the country, based upon an original and independent study of documents, official reports, and catalogues. Harvard, Yale, Columbia, and Cornell were selected to represent the best Eastern and Northern experience in the teaching of history; the University of Michigan worthily stands for the great West; while the young Johns Hopkins University represents the historical spirit of the New South. At this latter institution studies are in preparation upon Jefferson and the University of Virginia, and the History of Higher Education in North and South Carolina and Georgia.

The best colleges for women have been included in the present monograph, namely, Vassar, Wellesley, Smith, and Bryn Mawr.

Many other institutions are brought into rapid review by means of the statistical tables appended to this report, and representing returns actually made to this Office. Other colleges are mentioned in a special inquiry into the subject of American History in our Schools and Colleges, contributed to this report, at the request of Doctor Adams, by Dr. Francis N. Thorpe, Fellow of the University of Pennsylvania. An account of the Study of History and Political Science in the Washington High School, by Dr. E. R. L. Gould, formerly Fellow of Johns Hopkins University, concludes the report. Doctor Gould's account shows what can be done for the development of secondary education in history and economics, and what actually has been done in the Federal capital under the auspices of the Government.

In this monograph, prepared by Doctor Adams, theoretical and ideal views of historical training have been carefully avoided. The writer has deliberately confined his attention to select chapters of actual American experience, and to things done or

attempted by particular institutions and individuals, whose work he has studied from authentic records. He has thus opened up a new line of inquiry, namely, the history of academic departments.

History is simply the record of human experience, whether in physics, politics, economics, ethics, or education. History has been called philosophy teaching by example; or, as teachers say, by object-lessons. Doctor Adams has applied the historical method to the discovery of the most approved methods of teaching history and of organizing historical departments in our American schools and colleges.

One of the most suggestive and noticeable features of his work is the attempt to illustrate by photo-engravings and diagrams the actual environment or library surroundings of certain schools of history and politics. In these modern days the college or university library has been brought into close *rapport* with department work by means of an ingenious system of seminary or class libraries in the very room where students meet. This suggested the introduction of the laboratory method for the study of history and other moral sciences. The growing value of historical and political studies, and the importance of promoting them throughout the country as a means of strengthening good government and good citizenship, I need not emphasize.

I beg leave to recommend the publication and illustration of this report on The Study of History in American Colleges and Universities as a most valuable contribution to the history of higher education in the United States.

Very respectfully, your obedient servant,

N. H. R. DAWSON,
Commissioner.

Approved.

H. L. MULBROW,
Acting Secretary.

OPINIONS OF THE RECENT WORK OF THE BUREAU.

In commendation of these contributions to American educational history many letters and acknowledgments have been received by the Bureau of Education from competent specialists and educators in the Old World, as well as in the United States and Canada. Our publications have been gratefully acknowledged, not only by American libraries and institutions of learning, but by the universities and learned academies of all the leading countries of Europe. It is impossible in this connection to present this mass of letters of acknowledgment; but the following selections from American critical journals and popular newspapers will serve to show how the recent work of the Bureau has been received.

"The Study of History in American Colleges and Universities. By Herbert B. Adams, PH. D. Washington, Government. 8°.

"The Study of History in England and Scotland. By Paul Fredericq. Baltimore, Johns Hopkins University. 8°.

"By a pleasant coincidence these two volumes reach us together, and they have a great and reciprocal interest. When Dr. Adams comes to look over the present series of his Studies, we believe that he will find it the most interesting, and perhaps the most valuable, of all.

* * * * *

"Dr. Adams's paper on the study of history in American colleges and universities is quite as painstaking and far more comprehensive a study than that of Professor Fredericq. The substance of some of the chapters has previously appeared as articles in Education, but they are now reproduced with many additions. Dr. Adams traces the study of history at Harvard from its foundation up to the preparation of

Mr. Winsor's Narrative and Critical History of America, and at Yale from the seventeenth century to the foundation of the courses now given by Professors Wheeler and Dexter. To Columbia College the writer awards the honor of being the first institution in America to recognize history as worthy of a professorial chair. His sketch of the historical teaching at Columbia, which embraces the work of Vardill, Anthon, MeVickar, Lieber, and Burgess, is in many respects the most interesting in the volume, and to it a very appreciative account of the School of Political Science is added. The University of Michigan and Cornell receive separate and generous treatment. The chapter on the Johns Hopkins University is a slightly revised reprint of Dr. Adams's earlier paper on the subject. We were very much interested in reading of the excellent instruction being given in the colleges for women, particularly at Wellesley.

"Read in connection with each other and together with Professor Fredericq's articles on the teaching of history in Germany and France, published some little time ago in the *Revue Internationale de l'Enseignement*, these pamphlets afford us the data for determining with some approach to exactness the comparative value of the historical instruction now being given at the world's great colleges and universities. We find advance everywhere—promising, hopeful advance. The spirit of Savigny, Ranke, and Droysen is abroad; and the work of Freeman and Seeley in England, and of Burgess, Emerton, Adams, and Channing in this country, is in the right direction, and productive of excellent results. But the next generation will be even better able than our own to appreciate what the modern method of studying and teaching history really means."—*Science*, December 9, 1887.

"One of the most interesting publications ever sent out by the Government Bureau of Education is a book entitled *The Study of History in American Colleges and Universities*, by Herbert B. Adams, Ph. D., associate professor of history in the Johns Hopkins University. It is a work of 300 pages, and it is excellently illustrated with full-page wood-cuts of the reading rooms of leading institutions. The picture of the book room of the Peabody Library is especially good. The work was prepared at the request of the Bureau of Education. Dr. Adams treats the subject from an historical point of view, and his book, in point of general and special value, is one of the most substantial contributions to higher education that has been published this year. Harvard, Yale, Columbia, and Cornell were selected to represent the best Eastern and Northern experience in the teaching of history; the University of Michigan worthily stands for the great West, while Johns Hopkins University represents the historical spirit of the new South. At this latter institution studies are in preparation upon Jefferson and the University of Virginia, and the History of Higher Education in North and South Carolina and Georgia. The colleges for women that have been included in the monograph are Vassar, Wellesley, Smith, and Bryn Mawr. Many other institutions are brought into rapid review by means of the statistical tables appended to this report, and representing returns actually made. Other colleges are mentioned in a special inquiry into the subject of American history in our schools and colleges, contributed to the report, at the request of Dr. Adams, by Dr. Francis N. Thorpe, fellow of the University of Pennsylvania. An account of the study of history and political science in the Washington High School, by Dr. E. R. L. Gould, formerly fellow of the Johns Hopkins University, concludes the report. In the monograph theoretical and ideal views of historical training have been carefully avoided. The writer has deliberately confined his attention to select chapters of actual American experience, and to things done or attempted by particular institutions and individuals, whose work he has studied from authentic records. He has thus opened up a new line of inquiry, namely, the history of academic departments."—*Baltimore American*.

"It is not often that Government publications can be recommended as interesting reading, but this monograph [*The College of William and Mary*], written by one of the most distinguished historical scholars in America, is an exception to the general

rule. Several practical educational questions * * * are ably discussed, and those interested in the higher education will find it instructive as well as entertaining."—*State Chronicle (Raleigh, N. C.), May 26, 1887.*

"The second circular, also by Doctor Adams, is an extended and valuable report on The Study of History in American Colleges and Universities. Its aim is to revive the study of political science throughout the country by promoting the study of the American nation as a basis."—*The (Philadelphia) American, December 24, 1887.*

"Of all the Circulars of Information issued by the Bureau of Education, one of the most valuable is No. 2 for 1887, entitled The Study of History in American Colleges and Universities, by Dr. Herbert B. Adams, Professor of History in the Johns Hopkins University, Baltimore.

"This 'circular' reaches the respectable dimensions of a volume of 300 pages, and consists of two parts; the first is an extended account of the origin and growth of historical study at some of our largest universities, and the second a summary of its present condition, to which are added extensive tables, showing all the details of the departments of history in forty-seven colleges and universities at the present time.

"To all interested in education this monograph will be welcome. To those who hold to the 'classical' side of the controversy concerning the proper subjects of college discipline, it will bring comfort in the oft repeated statement that the study has ever been and must continue to be 'based upon the solid substructure of thorough classical study.' Believers in the 'elective' programme will welcome it as indicating a tendency toward studies practical as well as disciplinary. It is well worth the attention of conservative institutions as indicating to them some of the distinctively modern demands which are now so plainly made upon them, while at the same time it shows clearly enough that they are in the best position to meet these demands. The large number of students at institutions of very recent origin shows that an exclusive reliance upon the traditions and methods of previous generations can not be maintained, certainly not if that reliance implies the deliberate closing of the eyes to tendencies which are none the less deep and strong because they are only lately developed.

"Several very attractive pictures of library interiors are found in the book, and help to make it the most complete and satisfactory account we have of college work in this one line."—*The (New York) Independent, February 9, 1888.*

As additional evidence of the influence of the work already done in the field of educational history, I would call attention to the fact that the Legislature of Virginia has lately agreed to revive the College of William and Mary by an annual grant of \$10,000 to make it a normal college in addition to its general academic functions. The accompanying letter from General William B. Talliaferro, president of the Board of Governors, is a gratifying statement of this fact:

DEAR SIR: In response to my request, you did me the favor to send me a number of copies of the paper prepared for your Bureau by Dr. Herbert B. Adams, of Johns Hopkins University, upon the College of William and Mary. In the extreme financial embarrassment to which events beyond control had reduced that college, which resulted practically in closing its doors, the Board of Governors determined, for the first time in her history, to apply to the Commonwealth for some relief, and accordingly a proposition was submitted to the General Assembly at its late session by which in consideration of an annual appropriation of \$10,000, the college proposed to educate free of all charge for tuition not less than one young white man for each county or delegate to the General Assembly, on condition that satisfactory assurance should be given by the student that he would teach two years in the public free schools of the State. In addition to the collegiate course it was proposed to establish a system of normal instruction in which these pupils should be trained without expense.

The college possessed ample buildings for lecture rooms, assembly halls, boarding houses, dormitories, and it was believed by the friends of the institution that the free school system of the State, to support which more than a million and a half of dollars is annually collected from the people of Virginia, would receive, by the infusion of trained teachers into the public schools, a benefit which can hardly be over-estimated.

It is perhaps well to state that we have in Virginia two normal schools for colored pupils, namely, at Hampton and Petersburg, and one at Farmville for white females, but no normal institution for white males. To present this scheme to the Legislature a committee was appointed, of which I was chairman. Believing that the naked presentation of the simple economic and practical proposition above stated would be greatly aided by an appeal to the sentiment involved in the even partial restoration of this ancient institution, and that the recollection of her history, and of the vast influences which she had exerted through her sons upon the destinies of the country, would rekindle the pride with which she had been heretofore regarded, and would aid us in our effort to secure the appropriation, the committee determined to avail themselves of the means of presenting this view to the Legislature which were so opportunely afforded by the admirable and very valuable production of Professor Adams, and it was therefore that I requested you to send me the copies which you so kindly furnished. We have had the good fortune to be successful, having secured the appropriation, and have, I think, the right to hope and the reason to believe that our old institution will renew its course of usefulness. I write now to acknowledge the obligation we are under to the Bureau over which you preside, to yourself, and to Doctor Adams, and to assure you that you may have the satisfaction of believing that the restoration of the oldest but one of the institutions of learning in the country will be quite largely due to the valuable paper which you have published.

I am, very respectfully, your obedient servant,

WILLIAM B. TALLIAFERRO.

Hon. N. H. R. DAWSON,
Commissioner of Education.

ALASKA.

One hundred and sixty years ago Vitus Behring discovered the strait between Siberia and Alaska which still bears his name, and which has since been extended to that part of the Pacific Ocean south of that strait between the continents of Asia and America and the Aleutian Islands. That intrepid explorer, in his second expedition between 1733 and 1741, discovered the Aleutian Islands, and touched the American continent south of Bristol Bay at the 58th degree of north latitude. Two years after this expedition had ended in his shipwreck and death, his attempts to establish a trade with the native tribes resulted in the acquisition of Northwest America by the Russian Empire. From that time until the sale of the territory to the United States, the Russian Government, through the agency of the trading companies, maintained an absolute despotism over the native races, and reduced the Aleuts to a state of serfdom. They were much more intelligent and less warlike than the Esquimaux, and were an entirely different people from the natives of the coast or the interior. The barbarous and inhuman treatment to which they were subjected by the early Russian explorers and trading companies, reduced the population to less than ten per cent. of

its original number. This system continued until 1818, when the Russian Government interposed between them and the trading companies, and adopted a policy which resulted in the improvement of their condition. In 1824 Father Innocentius Veniaminoff, now the Primate of the Greek Church, began his labors as a missionary among the Aleuts, and to him is due in great measure the change which has taken place in their condition. The entire race, under the influence of the clergy, were educated to some extent, and Christianized and converted to the doctrines and worship of the Greek Church.

Alaska, formerly Russian America, comprises all that portion of the North American continent lying west of the 141st parallel of west longitude, together with a narrow strip of land between the Pacific Ocean and the British Dominions, and separated from the latter by a line beginning at the southernmost point of Prince of Wales Island, in latitude $54^{\circ} 40'$ north; running thence north along Portland Canal to the point of the main land where it strikes latitude 56° north; and from this point along the summits of the mountain range parallel with the coast, except where the distance of these summits from the ocean exceeds ten marine leagues, to its intersection with the 141st meridian.

It also includes all the islands near the coast, and the whole of the Aleutian Archipelago, except Behring's Island and Copper Island, on the coast of Kamschatka. The area of Alaska, including the islands, is 532,000 square miles. This territory was ceded to the Government of the United States, in consideration of the sum of \$7,200,000, by a treaty with Russia on the 30th of March, 1867, the ratifications of which by the respective governments were exchanged on the 20th of June following.

By this purchase the United States acquired an additional extent of sea-coast on the Pacific and Arctic Oceans greater than its entire coast line on the Atlantic Ocean and Gulf of Mexico.

In regard to both climate and agriculture, the Territory is divided into three regions: The Yukon district, comprising the country north of the Alaskan Mountains; the Aleutian district, comprising the islands of that name and the peninsula; and the Sitka district, comprising the remainder of the Territory.

In the Yukon district the mean annual temperature is about 25° Fahrenheit, and the ground remains frozen to within two or three feet of the surface throughout the summer.

The climate of the Aleutian district is warmer, the mean annual temperature being from 36° to 40° Fahrenheit. In a series of observations, extending over five years, the greatest cold was found to be zero, while the highest temperature was 77° .

A still warmer and moister climate is characteristic of the Sitka district, the mean annual temperature being 44.7° , and the temperature during the winter seldom reaching the freezing point⁺

The interior of the country is well wooded. On the Pacific Coast dense forests of spruce, yellow cedar, hemlock, and balsam fir clothe the mountain sides, both on the islands and main land.

The Aleutian Islands are wholly destitute of timber. In the Yukon region the wooded district recedes from the coast, but timber is abundant in the interior.

The agricultural resources of Alaska are practically confined to the Aleutian and Sitka districts. The abundant growth of rich grasses in these districts affords excellent pasturage, and good oats, barley, potatoes, and root crops can be raised.

The natives of Alaska may properly be classed into two divisions, the Esquimaux and kindred tribes, and the Indians. To the first belong the inhabitants of the Aleutian Islands and the Innuvit, on the islands along the coast from Behring's Strait to Mount St. Elias.

The commerce of Alaska at present grows out of its fisheries, fur trade, and mining interests. Its extent may be inferred from the following carefully estimated statement of the market value of the products of these industries for the last year by the Governor of Alaska: Fur trade, \$2,500,000; gold (bullion and dust), \$1,350,000; fisheries, \$3,000,000; lumber and ivory, \$100,000; making a total of \$6,950,000.

Four peninsulas project from the continent into the waters of the Arctic and Behring's Seas. The most southern, long and narrow, has given its name to the whole land, and is prolonged by a chain of rocky islands westward for more than eight hundred miles.

From the southeastern corner of the main land projects the coast line as far south as $54^{\circ} 40'$ north latitude. Into the heart of the central portion of this Territory extend the northern ranges of the Rocky Mountains. One of these, the Alaskan range, turns southward at about 147° west longitude, runs along the southern edge of the Alaskan Peninsula, and forms the Aleutian Islands before mentioned, extending into the deeper waters of the North Pacific. North of these ranges the prodigious river Yukon takes its rise, flows through the Arctic plains, penetrates the mountains surrounding Norton Sound, and pours its floods into Behring Sea.

The river of warm water which flows through the Pacific Ocean, known as the Kuro-Siwo, or Japanese Current, is the great climatic influence of the country. It flows northward from the torrid zone along the coast of Japan, turns eastward and southward along the Aleutian Islands, then trends down the Pacific Coast of America, exerting its genial influence from Alaska along the shores of Washington, Oregon, California, and Mexico. Wherever its warm, moisture-laden winds find their way, there winter and drought are almost unknown. Under the influence of this wonderful current, and the winds that are constantly blowing landward across its temperate stream, the climate of the Aleutian Islands and southeastern Alaska is surprisingly temperate and mild, comparing most favorably with regions in the same latitude on the Atlantic coast.

This Territory is the only part of the United States that is not dominated at this day by the Anglo-American ideas and institutions, which began nearly three centuries ago to assert their supremacy in the New World. It has been repeatedly observed that colonization and civilization prosper best when travelling on parallels running east and west. This natural tendency is shown in the presence of the Esquimaux people in Alaska and other Arctic regions. The power that civilization gives increases this capacity, and the English races have shown themselves pre-eminently capable of successful modification and widespread growth. If it be true that

Westward the course of empire takes its way,

then the Anglo American flood-tide will eventually extend also to Alaska. Such seems the lesson of history, as it is the commonplace of poetry. Shall history repeat for Alaska the melancholy tale she has already penned respecting the Indian of the United States? Are the natives of the new Territory to be expelled from their fishing places and hunting grounds, confined to ever-diminishing reservations, or driven into mountains and deserts too poor to tempt the cupidity of the white invader? Are they also to acquire the vices and diseases of the white man, without acquiring his safeguards of industry, education, and religion? Shall they be exterminated, and shall the millstones of our Christian civilization grind to powder the simple children of our Alaskan winds and waves? These problems are to be solved in the shadows of the Rocky Mountains and along the tempestuous coasts of the Pacific, but the moral responsibility will rest upon us here, in the older, richer, better trained, and more thoughtful parts of our land. We may attempt to evade the problem and shirk the responsibility, but not without injury to our moral sense and fair fame as a great factor in the civilization of the Western Continent.

CIVIL GOVERNMENT.

The political condition of Alaska is anomalous and exceptional. The Organic Act of May 7, 1884, which provided a civil government, was deferred until nearly twenty years after the treaty of acquisition, and is an imperfect and crude piece of legislation.

This Act provides little more than the shadow of civil government, without the right to legislate or raise revenue. It expressly inhibits the operation of the general land laws, while it provides that the laws relating to mines and mining shall be in full force and operation. It provides no means by which its citizens may acquire homes or homesteads, or obtain title to an acre of land in its ample domain. It provides no means by which the inhabitants can obtain the benefits and protection of municipal law. It has established a single tribunal, with a more extensive jurisdiction than any similar court in the United States, but provides no means by which its processes and decrees may be

enforced. This Act has been well described as a "legislative fungus, without precedent or parallel in the history of American legislation."

As a consequence, the material progress and advancement of the Territory have been retarded, immigration has been discouraged, and its rich and inviting fields of industry remain undeveloped.

Tracts of land adapted to agriculture, producing vegetables and the grasses, and affording rich pasturage, may be found in many portions of the Territory. With the extension of the land laws to these parts of the country, an industrious and enterprising population would soon find comfortable homes and develop thriving industries. With the same advantages of civil government which are enjoyed by the citizens of other Territories, the people of Alaska would soon enter upon an era of prosperity which would justify the expectations of its most sanguine friends. It is to be hoped that Congress, at its present session, will provide such needful legislation as will protect its citizens and develop its rich resources. Alaska is the gate of the North Pacific, and in the not distant future must become one of our most valuable possessions.

EDUCATION IN ALASKA.

The duty of making needful and proper provision for the education of children of school age in the Territory of Alaska was devolved upon the Secretary of the Interior by the provisions of the act providing a civil government for Alaska, May 17, 1884, section 13, and the Commissioner of Education having been designated to carry out these purposes by the order of the Hon. H. M. Teller, Secretary of the Interior, bearing date March 2, 1885, and the same having been continued in force, with authority to prepare all needful rules and regulations for the management of the schools, a system of rules and regulations for the conduct of the public schools in the Territory was prepared, which was adopted and ordered to be promulgated by your order of the 15th day of June, 1887. These rules and regulations are contained in Chapter III of this Report.

This plan was forwarded to the Hon. A. P. Swineford, Governor of the Territory, and the other gentlemen who were appointed members of the Board of Education, with the request that they would at once organize under it.

When I took charge of this Office, as stated in the Annual Report for 1885-86, I found that Dr. Sheldon Jackson, General Agent of Education for the Territory, had just departed upon a tour of inspection. This was undertaken by order of my predecessor, which was approved by the Secretary of the Interior, bearing date of August 4, 1886. Under the authority given him a vessel was chartered, and he visited, in the fall of 1886, the Kadiak group of islands, the Shumagin Islands, and Unalaska, in Behring's Sea. During this voyage schools were established at several points, and a complete census of the population from Kadiak westward to Attu was taken. For a full report of his expedi-

tion, and of the condition of education in that Territory for the year ending June 30, 1887, I would refer to his report, which will be found in Chapter III, to the interesting details of which I would respectfully call your attention.

TOUR OF INSPECTION.

On the 15th of July last I was directed by you to visit the Territory for the purpose of examining into its educational affairs and public schools. I was instructed to see that the plan of education recently promulgated by your order of the 15th of June was put into operation, and that the schools of the Territory were made to conform to the same in its requirements; to examine the present condition of education among the children of school age, without reference to race; to decide what provision for the building of school-houses was needed, and to direct in what manner the school fund for the current fiscal year should be used, so far as I deemed necessary, and to make a detailed report upon the points covered by these instructions.

I left Washington on the 22d of July, and proceeded via the Northern Pacific Railroad to Tacoma, Wash. Ter., and thence by steamer through the inland passage to Sitka.

I was a passenger on the *Ancon*, and passed through the famous Alexander Archipelago, studded with its thousand islands. The ship stopped at nearly all the villages and settlements, affording me an excellent opportunity of seeing the country and conversing with its inhabitants.

Islands, mountains, glaciers, inlets, and channels appear all along this inland passage; the eye is delighted at every turn by a succession of the most beautiful and picturesque scenery. The islands are never out of sight, and rise from the bosom of the sea like emeralds in a crown of diamonds. The atmosphere is so light and pure that you are hardly conscious that you are breathing the elixir of life. The blue waters are as smooth and calm as those of an Alpine lake. Ranges of lofty mountains, rich in forest and verdure, with snow-capped summits and glaciers covering large areas, are nearly always in sight. All is wild, weird, and grand. Mounts La Perouse, Crillon, and Fairweather, and many others equally imposing, rising from 9,000 to 15,000 feet above the level of the ocean, with immense glaciers debouching from their frozen valleys and slopes, are successively seen; while Edgecumbe, whose fires have slumbered for a hundred years, with its crown of volcanic scoria glistening in the sunlight, appears like a sleeping giant resting from his labors. From its frozen peak cascades come leaping down like threads of silver until lost to view in the forest line.

En route I visited Nanaimo, Bella-Bella, Metlakahtla, and Port Simpson, in British Columbia; Fort Tongass, Annette Island, Port Chester, Fort Wrangell, Loring, Juneau, Douglas Island, Chilcat, and Haines. The steamer stopped for several hours and parts of days at each of these

points. At all of these towns schools have been in operation since 1885. I reached Sitka, the capital, on the 13th of August.

The schools were in vacation, but I met a number of the native children who attended the schools, and many adult Indians and citizens. Most of these children and some of the Indians speak English.

I met also the teachers at Fort Wrangell, Juneau, Killisnoo, Douglas Island, Chilcat, and Sitka, and obtained from them all the information they could give in regard to the condition of the native children under their care. They all unite in the opinion that the natives are both capable and willing, and learn rapidly.

METLAKAHTLA.

During the voyage, William Duncan, the distinguished English missionary, was a passenger on the steamer. Thirty years ago he established a mission for the Indians near Port Simpson, in British Columbia. He found them the slaves of superstition, practicing cannibalism and other disgusting rites of their ancestors.

Under his teachings about twelve hundred of them have been converted to Christianity and have gathered around them, in their Arcadian village of Metlakahltla, many of the comforts and appliances of civilization. The village was situated on a beautiful plateau near the seashore, and was in plain view of the steamer. One hundred dwellings, with gardens attached, two large school buildings, a public hall, several mills and stores, and a Gothic church, built of yellow cedar, equal in architectural design and finish to many of the churches of our own towns, attested their progress. Under his practical and sensible guidance they have been trained to habits of industry, and have become well-behaved and order-loving citizens. The children have had the advantages of schools and religious training. On account of some political differences between Mr. Duncan and the civil authorities of British Columbia, growing out of disputes respecting the title to the lands upon which this village was built, and also with the Church authorities, these people have become alienated from the Columbian government, and have removed to Alaska and placed themselves under the protection of the United States.

The point selected for their present settlement is on Annette Island, near Port Chester, about 60 miles north of the southern boundary of Alaska, and has been named Metlakahltla, after their old home. Mr. Duncan had been to the United States in the interest of his people, and was on his return. The steamer landed on Sunday afternoon, the 7th of August, at this point. The day was perfect—a “bridal of earth and sky.”

Attended by some of the passengers, Mr. Duncan was met upon the beach by a few of his people, and was warmly welcomed. The meeting was exceedingly impressive and affecting. Old men and women, girls and boys, gathered around this good man and expressed with tears their intense joy and gladness. Two United States flags, which had

been presented to him, were raised upon an improvised staff, and the Indians and passengers assembled under their folds in the shade of the trees on the shelving shore.

I quote the following description from the pen of a correspondent, who contributed a graphic account of this incident to the *Portland Oregonian* :

It is impossible to imagine a more lovely place than the harbor where the steamer lay at anchor. Semi-circular in shape, it opens out through a number of small islands to the sea on the westward. On the east and north, wild, rugged, mountains come down to the water's edge, and on the south a low green shore, skirted by a gravel beach, winds in beautiful curves.

The place was entirely uninhabited, except by a few of the Metlakahtlans, who occupied it as an advance guard of the colony. The remainder, about one thousand in number, will come as soon as the means of transportation are provided. The exercises were impromptu. Mr. Duncan addressed the people in their native tongue; told them of his trip to the United States, and mentioned how he had been received and how deep an interest had been excited in their behalf, and concluded by introducing Hon. N. H. R. Dawson, the United States Commissioner of Education, then upon an official tour of Alaska, who, at his request, consented to make an address, in order to allay the uneasiness of the Indians touching their new relations to the United States.

His address was interpreted by Mr. Duncan for the benefit of those who did not understand English. Mr. Dawson congratulated the Indians upon their advent to American soil. They were impressively told of the power of the great nation under whose protection they were about to place themselves, and assured that they would be protected in their rights of person and property and in the enjoyment of their homes, and that, although the general land laws of the United States were not in force in the Territory, they would be protected in the possession of any lands upon which they might settle, and that when these laws were extended over the country they would be allowed to hold their lands. In the meantime they would have the protection of the Government, and the same advantages of education which are enjoyed by the people of the Territory. Efforts had been made to impress them with the idea that the American Government was unfriendly to their settlement, but this impression Mr. Dawson successfully removed. His address was received with evidences of great satisfaction by the Indians. When he concluded, the flags were unfurled to the breeze, the ship saluting them with her single gun. The Indians sang "Rock of Ages" in their own language. The Rev. Dr. Fraser, of California, commended the new settlement to the protection of Divine Providence in a touching prayer, after which all united in singing "Coronation." One of the chiefs or selectmen, Daniel Ne-ash-kum-ack-em, then briefly replied to Mr. Dawson's address as follows:

"I desire to say a few words to let you know what our hearts are saying. The God of heaven is looking at our doings here to-day. You have stretched out your hands to the Indians. Your act is a Christian act. We have long been knocking at the door of another government for justice, but the door has been closed to us. You have risen up and opened your door to us, and bid us welcome to this beautiful island, upon which we have decided to build our home. What can our hearts say to this except that we are thankful and happy? The work of the Christian is never lost. Your work will not be lost to you. It will live, and you will find it after many days. The few of us who are here to-day have been made happy by your words, but how much more joy will they occasion when they reach all our people, numbering over a thousand. What shall we say more to thank you. We were told that no slaves lived under the flag of England. For a long time we relied upon this promise. We were content and happy, but we have found that our trust was misplaced. The promises made to us have been broken, and that nation, in its treatment of us, has set aside and disregarded its own laws, and has dealt with us as if we were slaves.

"We come to you for protection and safety. Our hearts, though often troubled, have not fainted. We have placed our trust in God, and He has helped us. We are now able to sleep in peace. Our confidence is restored. God has given us his strength to reach this place of security and freedom, and we are grateful to Him for His mercy and loving kindness. We again salute you, from our hearts, and thank you in the name of all our people."

This speech was delivered, in the intonations of his musical language, with a grace and ease of manner that harmonized well with the picturesque forum in which he spoke. It was an eventful occasion in the history of these people, and reminded me of the landing of the Pilgrims upon the inhospitable shores of New England, and was well calculated to rouse the highest feelings of devotion and enthusiasm. None who witnessed it, in the light of the serene heavens, and the beautiful landscape of mountain, sea, and forest, will ever forget it. It was one of those rare instances of patriotism and self-sacrifice for conscience' sake which are not often met with in the examples of history.

A large bell which the Indians had brought with them was tolled, its peals re-echoing from the distant mountains across the silent waters, and the passengers joined the Indians in their first service of evening prayer and praise in the presence of a gorgeous sunset. It was a striking illustration of the confidence and faith of these simple people in the providence of that God in whom they had put their trust.

The story of Metlakahltla teems with incidents of surprise and gratification. The abandonment of home and country by its entire population is well calculated to challenge the admiration and excite the sympathy of the country. So notable an event is not deemed unworthy of being called to your attention.

Mr. Duncan has removed nearly all of these people to their new home, and is now engaged in the arduous labor of providing for their shelter and support. He writes that strong efforts were made to dissuade them from carrying out their purpose, but that they have remained firm and steadfast. In December over seven hundred had joined him, and others were to follow. In addition to the Indians who have accompanied him, several neighboring tribes have signified their intention to unite with him in this new settlement.

A school has been established at Metlakahltla under the auspices of the Commissioner of Indian Affairs, and it is to be hoped that this colony will receive the protection and fostering care of the Government and people of the United States.

In making this voyage to Alaska, nearly ten thousand miles by land and water were travelled. Neither pen nor pencil can paint the wonderful scenery of this part of our continent, with its bays, inlets, and islands. It would be well for those who seek the delights of travel at least to acquaint themselves first with the wonderful beauties and features of this part of our continent, before seeking them in the Old World. Its calm and placid seas, its picturesque islands, its marvellous glaciers, its magnificent ranges of lofty mountains, are wonderful features of

its beauty and grandeur. Its immense forests, the abundance of its minerals, its furs and its fisheries, all promise to make it one of the wealthiest portions of our American empire.

It may not be extravagant to predict that, in the years that are to come, the exhaustless resources of this coast will furnish the material to rebuild the American shipping of the Pacific, and that these harbors will be the navy yards and havens for the commerce of half the world.

PLAN OF EDUCATION.

Upon my arrival at Sitka I found that the plan for the government of the schools, promulgated by your order of the 15th of June, had been adopted by the Board of Education, and that the Hon. A. P. Swineford, Governor of the Territory; Hon. Lafayette Dawson, Judge of the Federal Court for the district of Alaska, and Dr. Sheldon Jackson, General Agent of education for the Territory, who had been appointed members of the Board of Education, had promptly organized the same by electing Judge Dawson president and Dr. Sheldon Jackson secretary, and were proceeding to reorganize the schools. I met these gentlemen frequently in consultation, and discussed with them fully the condition of educational affairs in the Territory, and found them in full sympathy with the views and policy of the Department upon the subject of education, and heartily approving the plan of rules and regulations for the government of the schools.

They prescribed and adopted, with my approval, rules requiring the children between the ages of six and fourteen years, within two miles of any Government school, to be sent by their parents or guardians to school at least two-thirds of the time during which the schools should be open. These regulations were deemed absolutely necessary to insure the advantages of education provided for the children of the Territory by the Government. The schools, so far as I was able to ascertain by examination and consultation with officials and citizens, are well conducted, and the teachers are competent and prompt in the performance of their duties.

During my visit I was furnished with a copy of the following resolutions of the Board of Education, attesting its approval of the interest and policy of the Department in the schools of the Territory:

At a meeting of the Territorial Board of Education held at the office of Judge Dawson, at 4 o'clock P. M., August 22, 1887, Governor Swineford introduced the following resolutions, which were unanimously adopted:

Resolved, That the thanks of this Board, as well as of all other friends of education in Alaska, are due to the Hon. L. Q. C. Lamar, the Secretary of the Interior, for the kindly interest in the welfare of our rising generation manifested by him in sending hither the Hon. N. H. R. Dawson, the Commissioner of Education, to personally examine into and report upon the educational needs of our Territory.

Resolved, That the thanks of this Board are likewise due and are hereby tendered to the Hon. N. H. R. Dawson, not only for the excellent plan devised by him for the promotion of the cause of education in Alaska, but as well for the zeal manifested by him in personally investigating the condition of the schools already established, together with the necessity for others, to the end that he may be able to intelligently report

and recommend such further action by Congress as will fully supply the educational needs of the whole Territory.

We look upon his visit to us at this particular time as being fraught with promises of great good to the hundreds and thousands of children of school age in Alaska who are now being permitted to grow up in ignorance, and feel that we can not sufficiently thank him for the encouragement given, nor yet for the many valuable suggestions which have enabled us to put his educational plans into practical and successful operation.

Resolved, That the secretary be, and he is hereby, instructed to forward a certified copy of the foregoing resolutions to the President, the Secretary of the Interior, and Commissioner of Education, respectively.

I am satisfied that the adoption of this plan of education will add greatly to the efficiency of the administration of the schools in Alaska, and that it will be the beginning of a new era in its educational affairs. The education of the native inhabitants is a duty we owe them under the provisions of the treaty of acquisition with Russia. They stand upon the same footing in all their personal and civil rights with our own citizens, and upon the organization of a Territorial government will necessarily be admitted to all the rights of citizenship.

In the mean time they should be prepared, by having the advantages of education extended to them, to enter upon the duties of their new relations, and to meet the requirements and discharge the duties of our civilization.

PRESENT CONDITION OF THE SCHOOLS.

Dr. Sheldon Jackson has been in charge of the public schools since his appointment as General Agent in 1885, and has organized schools at twelve places. The following table, compiled from the monthly reports of these schools, as far as they have been received, shows their condition for the year 1886-87:

	Septem-ber.			October.			Novem-ber.			Decem-ber.			January.			Febru-ary.			March.

* Estimated.

I regret to state that the school at Bethel, which was founded by the Moravian Church, has met with a great many difficulties and disappointments, while that at Saint Michael, which was founded by the Protestant Episcopal Board of Missions, has been equally unfortunate. I trust that the difficulties which have been encountered will be surmounted, and that these schools will yet become centres of civilization in these inhospitable parts of the Territory.

The appropriation of \$25,000 for the present year will barely maintain the Government schools now in operation, including the building and repair of school-houses, and the purchase of supplies of stationery and fuel. In order to make this appropriation go as far as possible towards supporting the schools, it was found necessary to reduce the salaries of the teachers below the sum formerly paid them for their services.

Teachers have been reappointed for the next fiscal year at the above places, except Bethel and Saint Michael, and the indications are that there will be an increased attendance.

While at Sitka the Board recommended the erection of two new school buildings, one at Sitka and one at Juneau, at a cost of \$2,000 each, the completion of the school-house at Killisnoo, and of the school room at Fort Wrangell. To all of these recommendations I gave my consent.

From all the information I could gather, the school population of the whole Territory may be estimated at from 5,000 to 6,000.

There are conflicting opinions in regard to the increase of the native population. I, of course, could form no opinion upon this subject myself, and have had to rely upon the opinion of residents of the Territory. The general opinion seems to prevail that this population is not on the decrease, but is likely to increase. It is estimated that the entire population of the Territory is about 35,000.

Of this population about 25,000 are found in that section of the Territory westward from Kadiak, including the villages along the coast and islands, to the end of the Aleutian peninsula. These contain about 4,000 Creoles and Aleuts, who are civilized, and to a large extent educated. They reside mainly on the islands and are generally members of the Greek church.

In the southeastern section of the Territory the white population is estimated at 2,000, residing principally at Sitka, Juneau, Douglas Island, Wrangell, Killisnoo, and some smaller points, while the natives number seven or eight thousand.

WHAT PROVISION IS NECESSARY FOR SCHOOL-HOUSES.

In order to provide for the present wants of the Territory, and also for the accommodation of children at other points where schools are not now organized, it will be necessary to build a number of school-houses.

The Board of Education, after a full consideration of the educational wants of the Territory, urgently recommend the immediate organization of schools, with the erection of proper school-houses, at the following points: Unalashka, Belkofsky, Morshevoi, Wood Island, Spruce Island, Haguck, Ayakhtalik, Cook's Island, Yakatak, Hoonah, and Metlakahtla.

This would require for the first year an outlay of \$10,500 to build school houses, \$9,000 for the salaries of teachers, besides \$3,400 to provide supplies for the support of the schools, aggregating \$22,900. At these places the population under twenty-one years of age is estimated at 1,097.

The Board of Education also recommend that schools *ought* to be established at the following places :

Karluk, Katmai, Old Harbor, Orlova, Umnak, Skilakh, Sushetno, Atkha, Klukwan, Attoo, and Akhiok.

The population under twenty-one years of age at these places is estimated at 836. In order to establish schools at these points it would require an expenditure for buildings of \$11,000, for teachers' salaries of \$12,800, and for supplies \$3,300, amounting to \$27,100.

In transmitting to me the above recommendation the Board use the following language :

For your guidance in preparing the estimates of appropriations for education in Alaska for the fiscal year ending June 30, 1889, the Territorial Board of Education have the honor to transmit to you, as a preliminary report, the following tables, and to recommend that you urge upon Congress the importance of making an appropriation sufficient to establish these new schools.

Tables Nos. 1, 2, and 3 aggregate \$77,100. New mining camps, like Douglas City and Berner's Bay, and fisheries, like Loring and Tongass Narrows, will also probably require schools soon, so that for one year an appropriation of \$85,000 could be wisely used for education. After the necessary buildings are erected the annual expense need not be so great.

The tables referred to in this communication are as follows :

Estimates for the support of existing schools in Alaska for the year ending June 30, 1889.

Places.	Salaries.	Buildings.	Supplies.	Population under 21 years.	School attendance 1886-87.
Yukon River.....	\$1,200		\$150		
Bethel.....	1,200		150		13

Atkha.....	1, 200	1, 000	300	41
Klukwan.....	1, 200	1, 000	300	200
Attoo.....	1, 200	1, 000	300	61
Akhiok.....	1, 200	1, 000	300	48
Total.....	12, 800	11, 000	3, 300	836

After consultation with the Board, as already stated, I decided that at least \$5,000 of the present appropriation should be used to build school houses at Juneau and Sitka, to complete the school-house at Killisnoo, and to repair that at Wrangell. I deemed the erection and repair of the school buildings at these places absolutely necessary, after a personal inspection of the buildings that had been in use. They did not afford suitable accommodations for the teachers and children.

The cost of building is made expensive by the fact that all the lumber used for building purposes in the Territory has to be purchased at Tacoma or Portland. There are immense forests of spruce and hemlock, which afford abundant timber of excellent quality, but the United States laws prohibit the manufacture of lumber for sale.

APPLICATION OF SCHOOL FUND FOR PRESENT YEAR.

The school fund for the present year will be applied towards the maintenance of the schools now organized, and the completion and repair of school houses at the points mentioned, and for the purchase of supplies of stationery and fuel.

The members of the board desire to do all in their power to increase the efficiency of the schools, and to extend the benefits of education to all the children in the Territory.

It will be remembered that the Government owns no school-houses at any of the points where schools are now established, except at Sitka, Juneau, Killisnoo, and Fort Wrangell. At all other points buildings have to be leased. I can see no good and sufficient reasons to postpone the establishment of schools at all the points where they can be supported and have the attendance of a moderate number of children. If the natives are to be civilized, the earlier the proper means are adopted to educate them, the better for them and the better for the country; they will the sooner become citizens and add to the wealth of the State by their intelligence.

I feel great confidence that the creation of a Territorial Board of Education, with the rules provided for the government of the schools, will insure an honest and faithful administration of the educational affairs of the Territory, and a wise and judicious expenditure of the appropriations made for that purpose. The aid and assistance of a local board I deem absolutely necessary for the proper administration of the educational affairs of that distant and isolated district. The familiarity of its members with the condition and wants of the Territory must be of great advantage in the organization and management of its public schools.

FUTURE POLICY OF THE GOVERNMENT.

It is conceded that the perpetuity of our American institutions depends in great measure upon the intelligence of its citizens, and that this intelligence is due in no small degree to our system of common schools and public education. If it be true that the intelligence of the American citizen is so necessary to the security and enjoyment of his liberties, how much more important is it that the native races, who are now being endowed with all the rights of citizenship, shall be prepared by education to appreciate and enjoy their new privileges, and to understand their new obligations and political relations. Especially is this true of the people of Alaska, whom the Government has undertaken by its treaty stipulations to place upon an equal footing with its own citizens. Their education and elevation in the scale of civilization should become the settled policy of the Government, and should be pursued with earnestness and vigor. It is proposed by the plan for the local management of the schools, which has been put in operation, should the means be furnished, to establish common schools in every native tribe, and in every settlement having a sufficient number of children, which schools shall be open to all, without reference to race. They are to be taught to speak, read, and write English, the purpose of the Government being to educate them in our customs, methods, and language. In addition to the public schools which are supported by the United States Government, seventeen schools are maintained by the

Greek Church on the Aleutian Islands and in the southernmost part of the Territory, at which the children are taught both the Russian and English languages. These schools have an attendance of about four hundred children, and are supported by the Imperial Government, which appropriates annually the sum of \$20,000 towards their maintenance.

At Sitka the Presbyterian Missionary Board maintains an industrial training school, which is partially supported by the Government, and is in a flourishing condition. It has over one hundred inmates, who are taught the elementary branches of a common English education. The boys are also taught carpentry, while the girls are taught to sew, knit, and cook, and are trained in housekeeping. The school is under the management of Prof. William A. Kelley, and for its purposes is a most excellent institution. It is well managed and conducted, and deserves the fostering care of the Government. The children are well clothed, well fed, and well behaved, and are attentive to their studies, and great attention is given to their moral as well as their mental training. It has trained quite a number of boys as carpenters, who are now valuable citizens and a great acquisition to the community.

The improvement of the educational condition of the inhabitants depends entirely upon the liberality of the Government, and unless larger means than the appropriations which have been heretofore made are obtained, no improvement can be expected. Many of the natives speak English, and some are fairly educated in the elementary branches, and seem anxious to adopt the manners and customs of the white man. They make good mechanics, miners, sailors, and laborers, while a few are skilled artisans and carve beautifully in wood and metal. Some of the specimens of their handicraft in carving and jewelry are indeed surprising, when we consider the few opportunities that they have had to improve themselves in any of the arts. Unlike the Indians upon the continent, they are generally industrious and self-supporting, and are in no sense of the term the wards of the nation. They feel the necessity of labor in order to supply themselves with the comforts of life and to protect themselves against the inclemencies which prevail in these Arctic regions. Many have abandoned the savage practices of their ancestors, and have been brought under the humane teachings and influences of Christianity, and are members of the Greek, Roman Catholic, and Protestant communions. This is particularly the case with the Creoles and the Aleuts, who are to a large extent civilized and educated.

My own observation in respect to the character of these people coincides with the opinion of the Hon. A. P. Swineford, expressed in the following paragraph from his report for October, 1885:

These people, it should be understood, are not Indians. Their appearance, habits, language, complexion, and even their anatomy mark them as a race wholly different and distinct from the Indian tribes inhabiting other portions of the United States.

They are far superior intellectually, if not in physical development, to the Indians of the plains, are industrious, more or less skilful workers in woods and metals, and

that they are shrewd, sharp traders all who have had dealings with them will be willing to testify. They yield readily to civilizing influences, and can, with much less care than has been bestowed upon native tribes elsewhere, be educated up to the standard of good and intelligent citizenship. Just in proportion to their educational progress they should have the rights and privileges conferred and the duties and penalties of full citizenship imposed upon them.

It will be observed that the Territorial Board of Education estimates the amount needed for the support and organization of schools in the Territory and the building of the necessary school-houses, at \$77,000. I do not think this sum is extravagant or too large, if it be the purpose of Congress to provide schools for the whole population of the Territory, and to extend the advantages of education to all the children within its limits. In view of the fact, however, that all of these schools cannot conveniently be organized and provided with suitable buildings within one year, I think that an appropriation for the next fiscal year for education in Alaska should not be less than \$50,000. This sum will support the present schools with some additions, and allow \$20,000 to be used in the erection of school-houses at places where they are absolutely necessary. If schools are to be maintained, buildings must be provided. For this reason I believe that the sum of \$50,000 can be wisely and judiciously used for the purposes mentioned, and I therefore recommend it, and I hope that an appropriation of that amount will be recommended by you in your estimates.

I remained in the Territory until the end of August, and during my visit was the recipient of many kindnesses and courtesies at the hands of citizens and officials. To the governor, the judge of the district court, the general agent of education, the collector of the port, the marshal, and clerk, I am specially indebted for many attentions, and also to Commander J. S. Newell, of the United States steamer *Pinta*; Lieut. James A. Turner, U. S. Navy; the late district attorney, Hon. M. D. Ball; Mr. Maurice E. Kenealy, editor of the *Alaskan*; Hon. James Sheakley, U. S. Commissioner at Fort Wrangell; and Mr. George Kosirometinoff, United States interpreter, all of whom gave me every opportunity and facility to prosecute the objects of my visit.

I have also to acknowledge the great kindness of the Rev. Mr. Austin, and of Prof. W. A. Kelley, of the Presbyterian Mission School, at Sitka, and of their excellent staff of teachers.

REMOVAL OF THE OFFICE.

The sundry civil appropriation bill, approved March 3, 1887, enacted that as soon as practicable after the completion of the Pension Building, and not later than December 1, 1888, the Secretary of the Interior should cause to be removed to that building the General Land Office, the Bureau of Education, the office of the Commissioner of Railroads, and the Bureau of Labor, and vacate the buildings now occupied by said Offices and Bureaus.

I would respectfully protest against the removal of this office, as

contemplated, and urge you to use your influence to have the order of Congress, so far as it relates to the removal of this Bureau, revoked, and suitable provision made in the appropriation bills for the retention of it in its present quarters.

The duties performed by the employés of the Bureau of Education, though nominally clerical, generally differ from those performed by clerks in most Offices. The principal duty of this Bureau is the collection, preparation, tabulation, and publication of statistical information in the form of reports, and such other methods as shall seem best fitted for the benefit of the public schools and the improvement of the means of education. In other words, much of its work is original, and requires careful study, analysis, and investigation. In its investigation this Bureau deals largely with questions of a statistical and historical character, and needs for the full performance of its work the use of books and apparatus to which no parallel can be found in the ordinary service of most Government Bureaus. These investigations require the comparison of authorities, the compilation of reading matter, calculation and construction of statistical tables, and the general investigation of educational causes, conditions, and results. To perform this labor successfully its employés need not only good light, good air, comfortable temperature, and properly constructed seats and desks, but also an ample collection of books close at hand and ready for reference, a museum of articles relating to the construction of educational buildings, the furniture of school rooms, and the apparatus of instruction, space around each employé for the proper use of books and articles from the library and museum, and freedom from the disturbance and noise which inevitably exist when large numbers of employés are congregated, no matter how orderly their behavior. It is quite possible in ordinary offices to organize clerks into divisions of one or two hundred, with subdivisions of correspondingly large size. It is utterly impossible to do this in such an office as the Bureau of Education without sacrificing both the unity and the accuracy of results.

In consequence of the character of its work, this Bureau has accumulated a very valuable library of 20,000 volumes, 60,000 pamphlets, and many thousand duplicates, and a museum of approximately twenty thousand articles. These books and articles have been collected from all countries. The books are in many languages, and on all subjects relating to education. The space assigned to them in the present building is inadequate to their perfect use, but is so apportioned that the most useful and necessary parts of these collections are accessible and are effectually protected from the intrusion of unauthorized persons. The isolation of the Office and its property, as at present organized, I deem essential to the usefulness of the one and the safety of the other.

The removal of these collections is no mere matter of transfer from one building to another, but will require time, care, and money.

The loss of time in making such a removal will be great; the loss of convenience almost entire; and the labor and money required for this purpose will be considerable.

The foregoing observations are not presented as my theory of the matter, or from any personal objection to removing to the Pension Building, but are the result of the past experience of the Bureau in a somewhat similar position.

Eleven years ago Congress caused the Bureau of Education to be moved from the present building to a joint occupancy with the Pension Office of the building on the corner of Twelfth Street and Pennsylvania Avenue. The Pension Office then, as now, was the first occupant of the building, and the quarters assigned to this Bureau were so inadequate in extent, inconvenient of access, and unsuited for its work, that practically no efficient work was done by this Office during the year that the joint tenancy continued. The growth of the Pension Office forced the Bureau out of its unwelcome quarters, and Congress removed it back to the present building, the two changes in location costing somewhat more than the present rent of this building for one year.

The Twelfth Street building, like the present Pension Building, consisted of large rooms on each floor, suitable, perhaps, for the large divisions and sections of the Pension Office, but absolutely destructive to the repose, the quiet, and the seclusion found essential to the proper performance of the duty of the Bureau of Education. The plan of the present Pension Building, the great number of employés already in that office, and the very large number proposed to be added by the transfer of other offices, will repeat, and doubtless aggravate, the history of that change.

Another view of the relations of this Bureau to its work would not occur to the ordinary thinker. It was established chiefly for the purpose of supplying the teachers and people of the United States with information as to the methods most useful for the promotion of public and other education. The performance of this duty has made it proper to open the library and museum of the Office to persons interested in education, and such persons, under present circumstances, subject to proper regulations, have made frequent and valuable use of them.

If the Bureau and its collections are to be moved to a building where the necessities of another kind of service will render access to the library and museum difficult or uncertain, the use of them by persons not connected with the Bureau would necessarily be greatly disturbed or prevented.

In this connection I would invite your attention to the wise and liberal action of Congress a few years ago, when a specially constructed building for the Medical Library and Medical Museum was authorized. By this measure the great working tools of that magnificent Bureau were put into a condition for most effective use, both by that Office and by those for whom that Office chiefly labors. The reasons that justified

the construction of that building are equally cogent for the permanent and suitable lodgment of the Bureau of Education separate from other Offices of dissimilar size and purpose.

The Wright Building, now occupied by the Bureau, is situated very near the office of the Secretary of the Interior, and close to lines of cars by which persons desiring to visit it for consultation and study may have easy access; and yet the location is one sufficiently quiet and retired to allow the work of the Office to be done in comfort and with considerable efficiency. Though too small for the needs of the Bureau, it can be made to serve for some time longer by a judicious use of the present space.

It contains about 11,000 square feet and has a basement and four other stories.

Briefly described, the basement is for the storage of fuel and the documents of the Office; the first story is used by the Statistical Division, the second floor by the Commissioner, chief clerk, and Record Division, and the third floor by the library and the clerks employed in connection therewith; while the upper floor is devoted to the museum.

It will be seen that the constructive divisions of the building correspond to the administrative divisions of the Office, while the six rooms on each floor permit that subdivision and seclusion which the nature of its work requires. In case of the removal of the Bureau to the Pension Building, there is no possibility of securing even an equal floor space; a reduction of this would be disastrous to the Bureau in every conceivable way.

If any change is made at all, the one dictated by a regard for the purpose and usefulness of the Bureau, would be to provide it with a building specially adapted for the safe and proper storage and use and display of its valuable collections and the efficient service of its employes, and until such a change can be made, it would seem wise, economical, and expedient to retain it in its present quarters.

DELAY IN THE PUBLICATION OF THE REPORT.

It has been my endeavor to expedite the publication of the Annual Report. I am informed that, as a general rule, of late years it has not been received from the Public Printer until about a year and nine months after the close of the period to which it relates. After so long a delay much of the statistical and other information which it contains is stale, and the value of the whole Report is seriously impaired.

Many causes conspire to produce this delay. The Bureau is in immediate correspondence with every known educational institution in the United States, sending its forms of inquiry at the end of each year to State superintendents of public instruction, superintendents of city schools, presidents and principals of academies, normal schools, kindergartens, professional, agricultural, and scientific colleges, colleges and universities, and to managers of libraries and museums, and receiving from them reports covering every phase and feature of the in-

terests under their charge. This, however, can not be done until after the close of the school year in June, when the work of preparing the Report commences. The statistical tables are made up mainly from the voluntary replies received after this date from these correspondents. Some of them, notably the State superintendents of public instruction, are themselves subjected to delay in receiving and collating the reports of their subordinates, so that their returns are frequently not received until many months after the close of the school year. The importance of early returns to this Office has been urged upon these gentlemen, and it gives me pleasure to say that they have responded promptly to my appeals as far as lay in their power. In some instances, however, they have not been able to give the desired information until seven or eight months after the close of the school year.

The work of digesting, tabulating, and summarizing the statistical returns, when once under the control of this Office, with accuracy and expedition, has been the object of constant solicitude. The employés of the Office constitute a force of experts, trained to handle the material thus collected. From their constant and intelligent study of the subject, and the accumulated experience of the past, they have learned what information is of most value to the educational world, how best to present their inquiries, and the breadth and scope to give them.

As a result of the efforts made in this direction, the preparation of the manuscript of the Annual Report for the Printer has been advanced some six months during the last two years. This Report is now sent to the Printer in ten months after the close of the school year.¹ It is not probable, for the reasons assigned above, that much further improvement can be made in this respect. It is greatly to be desired that the printing and binding of the Report should be conducted with greater dispatch.

The Office is now furnished with 20,000 copies of its Annual Report for distribution among its correspondents. When it is remembered that this Report is sent to all of the State, county, city, and town superintendents, to colleges and universities, secondary schools, public libraries, and a large number of teachers and others interested in education in the United States, and also to foreign Governments and institutions of learning, it will readily appear that this number is entirely too small to supply the demand. There are nearly three hundred thousand teachers in the schools of the United States. If only ten per cent. of these were supplied with a copy of this Report, thirty thousand copies would be necessary.

On account of this limited supply a great many most worthy applications have to be declined. The Reports of other Bureaus, certainly not more valuable to the people than those of the Office of Education, are given a large and liberal circulation. The claims and wants of the educational classes of the country would seem to deserve the same generous recognition and consideration at the hands of Congress.

¹ The manuscript of this Report was sent to the Printer May 16, 1888.

CONCLUSION.

In bringing this Report to a close, I beg to express my obligation to the large number of correspondents who have voluntarily furnished the greater portion of the material for its preparation. Without fee and without reward many thousand educationists promptly and cheerfully responded to all the inquiries and demands that have been made upon them. Without their valuable assistance and co-operation the Annual Reports of this Office could not be prepared.

I would also acknowledge my indebtedness to the employés and clerical corps of the Office, who have zealously, intelligently, and cheerfully performed the labors and duties of their respective positions. To the chief clerk and the chiefs of divisions I am under renewed obligations for their hearty aid and respectful kindness and consideration, while to you I must return my thanks for the interest which you have always taken in the work of the Office and for the uniform courtesy shown me personally and officially.

I have the honor to be, very respectfully, your obedient servant,

N. H. R. DAWSON,
Commissioner.

The Hon. L. Q. C. LAMAR,
Secretary of the Interior.

SOLUTION

CHAPTER II.

STATISTICS OF STATE COMMON SCHOOL SYSTEMS.

Completeness of the returns—System pursued—Multiplicity of ratios—Limitations of statistics—Urban and rural school systems—Misuse of the tables—Sources of error—School year, total population, and population 6-14 (Table 1)—School ages and school census (Table 2)—Enrolment (Table 3)—Average daily attendance (Table 4)—Total attendance; duration of schools (Table 5)—Number of school buildings; seating capacity (Table 6)—School libraries; high schools (Table 7)—Private schools (Table 8)—Teachers (Table 9)—Salaries of teachers (Table 10)—School revenue (Tables 11, 12, and 12 A)—School expenditures (Tables 13, 14, and 14 A)—Permanent school fund, total assessed valuation, and value of school property (Table 15)—Percentage of increase or decrease of various items during the past year (Table 16)—Ten years' growth of the public school system (Table 17)—Education in the South—Expenditure—Education in the North and West—Chief State school officers (Table 18).

Completeness of the statistical returns.—The progress and present condition of common school education in the United States is set forth in the following tables with as much accuracy and completeness as the material that came to hand up to the time of going to press permitted. Returns for the current scholastic year, of more or less completeness, were received from forty-one States and Territories, including Georgia and Louisiana, whose statistics for the calendar year 1886 are republished. This equals the number reporting the previous year. It is a matter affording considerable satisfaction that such is the case, since of the twenty-four States and Territories that have adopted the biennial report system few or none issue a report for the present year.

The Bureau is greatly indebted to many State superintendents for the special efforts they have made to forward their returns in season for publication, and in several cases for their courtesy in furnishing advance sheets of their printed reports. It is only through their voluntary co-operation in the interest of education that the exhibits which appear in the following pages have been made possible.

Seven States and Territories failed to send returns for 1886-87, as follows: New Jersey, Delaware, Tennessee, Wisconsin, Wyoming, Utah, and New Mexico. The returns of the preceding year are given in every case, however, except in that of New Mexico, from which no full educational statistics have been received later than those of the United States census of 1880.

The State superintendency of Delaware having been abolished, application for the statistics of the current year was made to the county superintendents; two of the three county superintendents (those for New Castle and Kent Counties) responded; as their returns did not give a complete view of the State, however, it was deemed best to publish the figures for 1884-85 as taken from the printed State report.

The statistics of Wyoming and Washington Territories were taken from the reports of their respective Governors to the Secretary of the Interior, and are very imperfect, especially those of the former Territory.

SYSTEM PURSUED.

The practice of working up in this Bureau the material of the returns made to it has been extensively pursued, as will appear from the following tables. The idea has been to give, not only the materials for information, but the information itself. Such computations as are most needed, and as are of general utility, have been made, so that those who have use for the results may find them ready to hand. Not the least advantage of this work is, that it is uniformly done for all the States, the imperfections and limitations of the data, when known, being taken into consideration, and the best results obtained of which the character of the material admits.

Arrangement.—The arrangement of the tables has undergone some alteration, chiefly with the object of facilitating reference and rendering more easy the comparison of different States and geographical sections with each other as regards their educational condition.

Totals.—No totals are given for the United States or for any geographical section, except in case of those items which are reported from every State or are estimated. The common practice of using incomplete totals as if they were complete, has been a fruitful source of erroneous deductions. Too much emphasis cannot be laid upon the point that only homogeneous numbers, such as only complete totals are, are comparable with each other. In order to fill up the most important columns, if returns were lacking in only a few instances, recourse was had to estimates, if there was any good basis therefor, or to the returns for the preceding year. In such cases it may be seen that the percentage of error in the totals is only a small fraction of what it was in the number so supplied. This course has been pursued on the assumption that it is better to have an approximate knowledge of a subject than to be entirely destitute of information regarding it.

MULTIPLICITY OF RATIOS.

The idea may occur to a person examining the tables for general purposes, without having his attention directed to any particular subject, that there are an unnecessary number of ratios, etc., enough, it may be, to perplex or even confuse him. But it must be borne in mind that each student or investigator who has recourse to the tables for any specific purpose, follows his own line of argument and requires data adapted to his own particular needs, according to the aspect under which he is viewing educational problems.

LIMITATIONS OF STATISTICS.

In the discussions of the tables the Bureau has formulated only the most obvious of the many conclusions of which the data admit. The points that can be satisfactorily elucidated by these statistics, however, are few, compared with the host of questions that are pressing for a solution, or upon which more light is desired. Even within their legitimate sphere the usefulness of the tables is greatly restricted by their incompleteness—to mention no other defect—by the array of blanks which is met with in nearly every column. But above and beyond this, the fact remains that but few of the circumstances or conditions that affect the educational life of a State can be subjected to quantitative measurement. The tables give the number of teachers in a State, but how can their educational force be measured as compared with as many teachers in another State,—their power of developing latent faculties, of moulding character, or of imparting information? We may know that in one State there has been half as much again expended for education for each child as in another, but where are we to find the figures which will tell which State profited most from its expenditure, in which it has been made judiciously under competent direction, and in which it has been marked by extravagance, jobbery, or a vain desire for outward show to the sacrifice of more essential matters? Regard should be had for these and like considerations in the use of statistics; the information they furnish should be compared with and supplemented by that derived from non-statistical sources, in order to get the clearest light practicable upon any subject.

URBAN AND RURAL SCHOOL SYSTEMS.

A comparison of the schools of a State which contains a dense city population with those of a sparsely settled agricultural State, is manifestly unjust to the latter; hence the desirability of making separate exhibits of the rural schools of the different States has forcibly impressed itself upon the attention of this Office. In order to effect this, the city statistics must be eliminated from the State returns, an operation which can be properly effected only when the city returns have all been made; these latter, however, have heretofore been incomplete, a considerable percentage of cities failing to make any report to this Office.

MISUSE OF THE TABLES—SOURCES OF ERROR.

Improper use of the tables.—There are frequently brought to the notice of the Bureau instances where false deductions have been made through improper use of the statistical tables. Nearly all these errors arise from considering as comparable with each other quantities which in point of fact are not so; which do not cover the same extent of territory or are for different years, or are not homogeneous in some other respect, as an inspection of the foot-notes or an examination of other columns of the table would generally have made apparent. For instance, in determining the amount of money expended in any State for each pupil enrolled, care must be taken that the enrolment and expenditure are each reported for the whole State and for the same year, and also that they are free from any other limitations that would impair the accuracy of the result.

The number of "children of school age" in one State can not be compared with that of another, except in those few cases where the school age is the same in the States concerned. This might appear to be a self-evident proposition, were it not for the fact that the expenditure per capita of "school children," the percentage of "school population" enrolled, and such like quantities are continually used as the measures of the educational status of the different States, even in journals of the highest class. If the

capacity of a bushel were different in each State; if in some, for instance, it were twice what it was in others, a comparison, without any notice of this circumstance, of the number of bushels of wheat raised in the different States would furnish results just as truthful as the comparisons involving "population of school age," the school age being arbitrarily determined by the Legislature of each State.

Defects of the tables.—The above remarks apply to the misuse of the statistical tables and the erroneous deductions resulting therefrom. There are other sources of error, however, inherent in the tables themselves, which the most skillful manipulator of statistics cannot avoid, being, in fact, unaware of their existence. These sources of error are of various kinds; but it is the desire of the Bureau again to call attention to that particular one which is the cause of the greatest confusion and misconception, *i. e.*, the want of uniformity in common school statistics.

This want of uniformity has been fully recognized in the addresses and discussions of educationists during the past decade and a half. The necessity for a common language of statistics has been frequently pointed out; but there has been no general movement in the direction of uniformity, notwithstanding the reports and recommendations that have been made. Steps in advance have been taken here and there, but the matter, as a whole, is in nearly the same unsatisfactory condition as ever. Each State has its own understanding as to the meaning of the terms used, its own rules and methods of computation, so that its statistical language is unintelligible when placed in juxtaposition with that of other States.

Classification of school revenue.—The classification of school revenue affords perhaps the most notable instance of diversity. There is a certain source, *viz.* the income of the United States surplus revenue of 1837, which is essentially of the same character in all the States that possess it. Yet it is classified in some States as income from permanent funds, in others as income from State taxes, and in one at least as income from local taxes, varying according to the system of book-keeping that may have been adopted. Again, in the case of taxes levied under a State law the revenue from which is retained and distributed in the localities where it was collected, there is a want of uniformity; such taxes are classed sometimes as State taxes, and sometimes as local taxes. Also, special taxes on the property and capital stock of corporations, and miscellaneous taxes and licenses, are sometimes classed as local taxes, and sometimes as revenue "from other sources." Taking it altogether, the table of school revenue affords but poor facilities for ascertaining the relative amount of income from the different sources in the several States.

Average wages of teachers.—There are two methods in use for ascertaining this quantity; the first gives the simple mean of the several rates of pay; in the second, each rate is given a weight proportioned to the number of months it was in operation, the average being found by dividing the total amount paid to teachers by the total number of months taught. Where the school term is of unequal length in different parts of a State and the salaries vary widely, it makes a great difference which method is used. Either one may be resorted to, provided it is uniformly followed by all the States, with a proper understanding of the result it gives. If the average salary is wanted, the first method would seem to be the proper one to use, since a salary is not a sum received, but is a rate of pay, and is independent of the time it is in operation. If the average amount actually received by each teacher during the year is wanted, the second method would be the one to use.

Reliable vs. unreliable statistics.—The above are only some of the more palpable difficulties that lie in the way of the adoption of a universal language of statistics. It is the more to be regretted that they exist, since, after a uniform system was once adopted, the making of reports, returns, and computations, at least in regard to certain important points, would be as easy as is now the case. A teacher need not be called upon to "lay down his life in a struggle simply to perfect his statistics;" he, as well as school officers, can attain to statistics of wide application with as little labor as they now do to those of limited range; to statistics that will not only answer the question, "Are we of this State advancing or receding?" but also that other question, "How do we stand as compared with our neighbors in other States?"

SCHOOL YEAR, TOTAL POPULATION, AND POPULATION 6 TO 14.

[Table 1, Page 54.]

Mode of computing population.—The necessity of having some statistics of population, and the methods of computing those given in this Report, are set forth somewhat in detail in the Bureau's Report for 1885-86 (pp. 22 and 23). It was erroneously stated in that Report, however, that a committee of the National Council of Education had recommended the age six to fourteen as the school census age. The original recommendation of their report was in accordance with that statement; but after considerable discussion in the council, the committee withdrew this recommendation and substituted four to

twenty-one as the school census age. The age of each individual enumerated was to be noted, however, so that the number of children between any two limits of age could be ascertained.¹

Predominance of child population.—An examination of the last column of Table 1 reveals the circumstance that the proportion of children to be educated in a community varies greatly in different parts of the country. In the North Atlantic Division, for instance, there are only 17 children of the age given to every 100 persons, while in the South Atlantic Division there are 21, and in the South Central Division 22. A computation of the number of children 6 to 14 years of age to every 100 adults would show a still greater disparity. This excess of children whose education is to be provided for forms one of the peculiar disadvantages under which the South labors, and must be taken into account in forming an idea of the educational situation in that section.

Density of population.—The density of population is another important factor affecting education. In sparsely settled agricultural States, where the schools are of necessity small and far between, the conditions are, and must remain, unfavorable to the development of a highly organized system, carried on at great expense for teachers and educational appliances, and holding sessions of nine or ten months in the year, as is the case with densely peopled States having a large urban population. It is on this account that Column 5 of Table 1, giving the population per square mile of each of the States and Territories, has been introduced.

It is a notable circumstance that while the density of population in the North Central States is less than one-third of that in the North Atlantic States (it being twenty-seven and ninety-seven in the two sections respectively), the people of the former group have nearly equalled, and in some cases surpassed, those of the latter in the development of their public schools. The fact that this is so forms a high encomium upon the enterprise and intelligence of the people of the North Central States.

The desirability of having separate exhibits of urban and rural school systems, in addition to the complete State exhibit, is referred to elsewhere in this Report.

SCHOOL AGES AND SCHOOL CENSUS.

[Table 2, Page 57.]

The primary object of a school census, in nearly every case where one is taken, is to secure a basis for the apportionment of the State school revenue. As a general rule, the persons of the age for free attendance at the public schools are the ones enumerated; in a few instances, however, as in Massachusetts, Rhode Island, Michigan, Oregon, and California, the scope of the school census is determined, not by the age of those entitled to free school privileges, but by special age limits which govern the distribution of the school revenues. Hence, as regards the school population of the different States as given by the school censuses, there is a want of homogeneity, not only in respect to the years included, but as regards the essential natures of these quantities, some of them being merely ages for the distribution of funds, others ages for free attendance.

This circumstance has been mentioned in order to illustrate further the non-comparability of the "State school populations;" this point can not be too strongly emphasized; it may be said, without exaggeration, that the treating of these quantities as homogeneous has been the most fruitful source of the abnormal and contradictory statements

that have been made of late years, in the public press and in legislative debates, regarding educational conditions.

Age for free attendance.—The age for free school privileges, as will be seen by the table, is very different for the different States. In an attempt at classification of these ages, it can not be found that they follow any very well defined law under the different aspects under which they may be viewed. In most cases they were presumably determined by local or temporary causes, and were not based upon any general consideration, else there would not be seen the diversity that actually exists in the case of contiguous and similarly circumstanced States.

The number of different school ages for free attendance is fifteen; of these, the age six to twenty-one has been selected by fourteen States; five to twenty-one comes next, adopted by ten States; and six to eighteen by seven States. Of the remaining ages, no one has been adopted by more than two States.

As regards duration, the Southern Central States have the shortest average period, extending over 13½ years; then follow (excluding in the computation those States whose age limits are undefined) the South Atlantic States, 14½ years; the Western States, 14 $\frac{5}{11}$ years; the North Atlantic States, 14½ years; and lastly the North Central States, 15½ years.

It will be seen that the differences in the duration of the free school age in the different sections of the country are so small as to be practically without significance.

In 1 State (Massachusetts) there is no inferior limit of the free-school age. In 4 States it begins at 4 years of age, in 15 at 5 years, in 23 at 6 years, in 3 at 7 years, and in 1 (Texas) at 8 years. As regards the superior limit of free attendance, in 2 States (Connecticut and Texas) it stops at 16 years, in 8 at 18 years (including the District of Columbia, where the free-school age is 6 to 17 *inclusive*), in 6 States at 20 years, in 28 at 21 years, and in 3 States (Massachusetts, Rhode Island, and Michigan) the free-school age extends indefinitely upwards.

In the preceding paragraphs the word "States" is to be considered as including also the Territories.

Compulsory school age.—Seventeen States, seven Territories (including Alaska), and the District of Columbia have a compulsory attendance law; twenty-one States and two Territories have none. The compulsory school age of New Mexico has not been reported to this Office, though it is known that a law establishing one was recently enacted.¹

The compulsory school age, unlike the free school age, has one well-defined characteristic, which the geographical classification adopted in the tables clearly exhibits. It is entirely wanting (except in the District of Columbia, which stands in a peculiar relation to the rest of the country) in the two southern divisions. Every North Atlantic State has compulsory attendance, except Pennsylvania, and the same is true of every North Central State, except Indiana, Iowa, and Missouri.

In many instances, however, the compulsory attendance law, if not actually a dead letter, is practically so, as will be exhibited in another portion of this Report.

The duration of the period of compulsory attendance ranges from 4 years (in Dakota) to 9 years (in Wyoming). Six years of age is the lowest inferior limit and 10 the highest (the latter also in Dakota). The superior limit ranges from 14 to 16 years of age, in no case going beyond the latter.

Increase of school-census population.—Although the school-census populations may not be compared with each other, nor aggregated, on account of their heterogeneity, the percentage of increase of these populations may, if we assume that the population between any two limits of age in any State increases in the same ratio as that between any other two limits (*i. e.*, that the proportion of the population of any given age remains constant in each State), an assumption that may be made as regards the increase of a few years within very narrow limits of error. It is on this assumption that the percentage of increase or decrease of school-census population has been aggregated by geographical divisions in Column 8 of Table 2.

The largest percentage of increase is found, as might be expected, in the Western Division, which contains the newer States and Territories that are being opened up for settlement, and where a small absolute increase sometimes causes a large relative one. Taking the five States and Territories of that division that furnish the necessary data, the average increase per cent. of the school-census population is found to be 5.63, which would cause it to double in about twelve and a half years.

The next largest rate of growth of school-census population is found in the South; the percentage of increase in the South Atlantic Division (based on two States only) is 3.21,

¹From information received at this Office since the tables were compiled, it appears that the law does not define the age at which children may be compelled to attend school in New Mexico, thereby rendering it applicable to the whole "school population"—*i. e.*, those from 5 to 20 years.

while in the South Central (based on five States) it is 4.21; these rates of increase would cause a doubling in the two divisions in twenty-two and in seventeen years respectively.

Of the individual States of these two last named sections, Alabama shows an increase of 7.2 per cent., equivalent to a doubling of her school population (and also of her total population, upon the assumption referred to above) in about ten years. This growth, if correctly reported, is a truly phenomenal one, and emphasizes the plea for more funds for the schools of Alabama, made by Superintendent Palmer of that State in his last report. The average increase of the school-census population for all the States and Territories affording data to be used in the computation (27 in number) is 2.61 per cent., which would cause it to double in twenty-seven years. States and Territories from all parts of the country and under all conditions of growth are represented in this average, and it may be considered as expressing with a tolerable degree of correctness the actual present rate of growth of the United States in population.

ENROLMENT.

[Table 3, Page 59.]

The total public school enrolment of the United States, as made up from the latest data received and supplemented by estimates in two cases (Arkansas and Montana), is 11,805,660.

Growth of enrolment.—The yearly increase for the United States can not be accurately determined, as ten States and Territories do not furnish the necessary data. Assuming, however, that the States and Territories so lacking have made the same progress as the others in the same divisions, the yearly increase would be 305,772, or at the rate of 2.66 per cent. per annum. The increase over the amount reported for 1885-86 is greater than this, a circumstance which results from the fact that the returns of some of the States are two or more years later than those given in the preceding Report.

In only five States (New Hampshire, Vermont, South Carolina, Ohio, and Nevada) and one Territory (Arizona) has the enrolment decreased. The largest relative decrease, 5.37 per cent., is found in New Hampshire. Dakota furnishes the largest per cent. of increase, 11.70, followed by Indiana with 9.20. This large development of the school registration of Indiana is a notable circumstance, when compared with the nearly stationary condition of that of the contiguous States, Ohio and Illinois.

The enrolment of Mississippi is considerably less than that reported for last year, as is also the average daily attendance. State Superintendent Preston writes to the Office that there has probably been no actual decrease, but that the attendance has heretofore been fraudulently exaggerated in the reports of certain teachers who were paid according to the number of pupils they taught. The law has been changed so that this method of determining teachers' wages is no longer practised.

Considering the different geographical divisions, all show a satisfactory growth in enrolment, unless it may be the North Atlantic Division, where the rate of increase (.71 per

cent.) is less than one-half the rate of increase of school population (1.62 per cent.); this last quantity, however, is computed from such defective data that entire reliance can not be placed upon it.

Proportion of children enrolled.—In the proportion of children enrolled in the public schools, the North Central States are far in the lead, having 121 pupils in the public schools for every one hundred children six to fourteen years of age. That this result should be a matter of congratulation, considering the relatively low density of population of these States, has been already noted.

Notwithstanding the tremendous strides that have been taken in the development of the school systems of the Southern States during the last ten years, as exhibited in Table 17, they are still far behind the Northern States in regard to *proportion of children enrolled in the public schools*. In the South Atlantic States only 89, and in the South Central States only 79 children out of every 100, 6 to 14 years of age, are enrolled as pupils in the public schools. This results in a great degree from the excessive proportion of children to grown persons met with in the Southern States; for if we compare the *proportion of total population enrolled*, the disparity which appears to the prejudice of the Southern States almost disappears, and in one case is quite reversed, *i. e.*, the proportion of total population enrolled is actually greater in the two Southern divisions (being 19.06 and 17.49 in the cases referred to) than it is in the Western Division (16.86).

No account is taken here of the duration of attendance at school, but only of the circumstance that the pupils were on the school registers. If the element of time is taken into consideration, the South appears much more at disadvantage.

The great advantage which the Northern States possess is the much larger number of tax-payers in proportion to the number of children to be educated. Even if the relative wealth of the North and South were equal, which is far from being the case, each tax-payer of the former section would have a far less burden to bear in the work of getting all the "schoolable" children within the schools.

AVERAGE DAILY ATTENDANCE.

[Table 4, Page 62.]

According to the most recent returns, the number of pupils daily attending all the public schools of the United States while they are in session is, on an average, 7,571,416.

As in the case of enrolment, it is not possible to determine the exact yearly increase, but a very fair approximation places it at 218,500, or at the yearly rate of 2.89 per cent.

The greatest increase in average attendance is observable in the South; in both of the Southern divisions it is not only remarkably large, but it is to be noted that it exceeds the increase of enrolment; in other words, not only more pupils are going to school there, but also the attendance of those who do go is more regular. This is an evidence of increased appreciation of public schools not to be overlooked.

Florida shows the greatest growth of average attendance, viz, 13.94 per cent.; in the District of Columbia, Virginia, and Georgia the growth is also exceedingly noteworthy. Indiana stands in the same relation to the States on her east and west borders as in the case of enrolment.

The average attendance has decreased in six States, so far as reported, viz, New Hampshire, Vermont, Rhode Island, Connecticut, New York, and South Carolina. The greatest decrease, 3.64 per cent., took place in New Hampshire.

Regularity of attendance.—The rate of increase of average attendance for the United States (2.89 per cent.) exceeds slightly the rate of increase of enrolment (2.66 per cent.) as estimated; this indicates a greater regularity of attendance for the country at large.

Column 7 of Table 4 gives this regularity of attendance explicitly. The average for the United States is 64.13; that is, for every one hundred pupils enrolled during the school year, sixty-four have attended daily, on an average, during the sessions of the schools; or, looking at the matter in another light, each pupil enrolled was present, on an average, sixty-four days out of every one hundred his school was in session.

Regularity of attendance is greatest in the Western Division (66.51), and least in the South Atlantic Division (62.79), but it is nearly uniform in the different sections of the country, more so, perhaps, than any other single item which admits of statistical record. When the individual States are considered, a greater inequality is observed; in Maine and Arizona the regularity of attendance is 82.79 and 84.26, respectively, while in Minnesota it drops to 49.17; it is possible, however, as in other instances, that this inequality may be due in some measure to inaccuracy or incompleteness in the school reports, or to a lack of uniformity in the methods used.

This regularity of attendance is far from being as high as is to be desired. Compulsory attendance laws do not seem to affect it to any appreciable extent, as it is somewhat higher in the South Central States, where there are no compulsory laws, than in the North Central States. It will probably depend for improvement upon a growing appreciation of the benefits of a public school education.

Such as it is at present, however, it is far in advance of any former period, and the progress it has made in the last semi-decade is especially noteworthy. This virtually uninterrupted growth in the regularity of school attendance will become very apparent from an inspection of the following tabular statement:

Ratio of average daily attendance to enrolment at various periods since 1871-72; computed from the Annual Reports of the Bureau of Education.

Year.	The United States.	North Atlantic Division.	South Atlantic Division.	South Central Division.	North Central Division.	Western Division.
	<i>Per ct.</i>	<i>Per ct.</i>	<i>Per ct.</i>	<i>Per ct.</i>	<i>Per ct.</i>	<i>Per ct.</i>
1871-72	59.29	58.26	57.14
1876-77	60.31	60.95	57.19	59.40	62.42
1881-82	60.67	61.67	59.85	55.34	60.94	63.60
1886-87	64.13	65.10	62.79	65.51	63.25	66.51

The tendency suggested by the above figures is unmistakable; they show conclusively the steady growth of a sentiment in favor of popular education—a growth not confined to any one part of the country, but extending throughout its length and breadth.

This remark will be seen to possess greater force when it is considered that there has been an increase in the proportion of children enrolled as pupils, as well as an increase in the proportion of the number enrolled who attend regularly (see Table 3).

Average number of pupils to a teacher.—This (as given in Column 8) may be said to be a measure of the sufficiency of the teaching force. It is only given for those States that report the number of teachers' places; and as that highly important item is reported from only a few States, the column is mostly blank.

As far as it is possible to ascertain, the number of pupils to a teacher is very nearly uniform in the different sections of the country, ranging from 23.59 in the Western Division (founded on two States only) to 28.06 in the North Atlantic Division (founded on three States). The figures for the individual States, however, show great inequalities, enough so to throw some suspicion on the accuracy or uniformity of the returns.

TOTAL ATTENDANCE; DURATION OF SCHOOLS.

[Table 5, Page 64.]

The total number of days attended is reported by but thirteen States. This quantity is so important for statistical purposes, however, and withal so simple and easy to obtain, that it has been deemed best to retain it in the tables, in the hope that it will come to be more generally reported.

It should be obtained by aggregating, or summing up, all the days attended in all the schools as shown by the school registers, and by no other method.

Comparative amount of schooling given.—Column 3 shows how many days' attendance each child 6 to 14 years of age would have been able to obtain if the actual attendance had been divided up among such children equally. This quantity possesses greater significance, as a measure of the amount of schooling given in a community, than perhaps any other single one that can be deduced from the data supplied to the Bureau. The results are comparative merely; any other minor age might have been selected, with the result of giving another series of numbers of virtually the same relative values.

It will be seen from this table that, so far as reported, the greatest relative amount of schooling was given in Massachusetts—enough, in fact, to provide each child six to fourteen years of age, with 194.79 days, or 9.74 months of twenty days each. From this the numbers range down to 39.51 days, given in Alabama, about one-fifth of that given in Massachusetts.

The summary of Column 3 by geographical divisions exhibits vividly the disparity in the amount of schooling given in the different sections of the country. The statistics given in Tables 3 and 4 related only to the number of pupils going to school, without regard to the length of time they went; the inequality under those circumstances was considerable, but still within bounds. It is when the element of time is introduced, and the whole school population brought into consideration, that the disparity between the sections is brought into strong relief.

Actual average amount of schooling given to each pupil enrolled.—Column 4 furnishes an entirely different set of numbers. Only the pupils on the school registers are taken into account, and the number of days each one on an average attended is shown. This quantity is of inferior significance to that contained in Column 3 or that in Column 5; but as it may be found useful to know in certain inquiries, it has been computed and tabulated here.

Average duration of attendance.—This quantity, given in Column 5, gives the average length of session of the schools in days, when to each school is given a weight proportioned to its average daily attendance. This is manifestly the proper basis upon which to compute the average number of days the schools were in session during the year. A school with ten times the average attendance of another school should count for ten times as much.

The "average duration of schools in days," tabulated in Column 6, is presumed to give the simple mean of the number of days of session of the different schools, regarding all the schools as equal units. This quantity is of no practical use, or would be of none, if the material existed for computing Column 5. It is less than that contained in Column 5, since the larger city schools with their greater number of days of session are not given their proper weight.

In the case of some States the numbers tabulated in Columns 5 and 6 are equal. This shows that in these States the average duration of schools in days (Column 6) has been derived from the average daily attendance or total attendance (Column 2), or *vice versa*, while in other States these quantities have been computed independently of each other.

This want of uniformity should be noted for the purpose of guarding against it. The quantities contained in Columns 2 and 6 are independent of each other, and each should be derived as previously stated.

The average duration of attendance, then, it may be repeated, is the average number of days the schools were in session, giving to each school a weight proportioned to its size (or number of pupils), and is found by dividing the total number of days' attendance by the average daily attendance.

The greatest duration of attendance, 189.62 days, is found in the North Atlantic Division, the least 94.23 days, in the South Central Division, so far as can be ascertained.

Increase in the duration of schools.—Of the States which furnish data for tabulating the change in the duration of schools, 18 show an increase, 8 a decrease, and 3 no change from the previous year. This indicates a decided balance in favor of more days of schooling in a year, but no estimate has been made of the extent of this change. Whatever it may be, however, taken into consideration with the increased regularity of attendance previously set forth, it shows a condition of affairs full of promise as regards the number of days' schooling given to each pupil.

It is hoped in the next Report of this Office to give more definite information regarding the increase over previous years in the duration of schools.

NUMBER OF SCHOOL BUILDINGS; SEATING CAPACITY.

[Table 6.]

School accommodations.—Column 2 of Table 6 gives the number of school buildings in each State, so far as reported. In some cases where reports were lacking the number of schools is given instead.

A knowledge of the number of school-houses is useful for some purposes; on account of their great difference in size, however, something else is needed to determine the question of sufficiency of school accommodations. This is effected by a consideration of the number of sittings taken in connection with the number of pupils for whom seats are to be provided.

The number of sittings is reported only from ten States and Territories. It is hoped that this number will be increased in future years.

As regards the sufficiency of the seating capacity, it should be observed that the number of seats may fall short of the enrolment, and yet be large enough, since all the scholars enrolled during the year are seldom present at one time. On the other hand, it should be greater than the average daily attendance, since the number actually attending must sometimes exceed the average. The number it should just equal, in order to show a sufficiency without a surplus, is the maximum attendance, a statistical quantity almost unknown in the United States, though used with effect in some foreign systems.

Whenever the number of sittings, then, exceeds the enrolment, there is, *ipso facto*, a sufficiency of school accommodation. This is the case with all the States reporting, except Rhode Island and the District of Columbia, as will be seen from an inspection of Column 6. Yet in these two cases the number of sittings exceeds the average attendance, so that a deficiency can not be argued; the data simply are not sufficient to determine whether or not the sittings are sufficiently numerous.

Column 8 gives the average number of sittings to a building, or the average size of school buildings.

SCHOOL LIBRARIES; HIGH SCHOOLS.

[Table 7, Page 67.]

School libraries.—The educational value of school libraries is beginning to be more fully appreciated by superintendents and teachers. No statistics upon this point in any degree approaching completeness, however, have ever been collected. Those given in Columns 2 and 3 of Table 7 present what information of a quantitative character touching this subject it has been possible to collect.

It appears that Ohio and Michigan are the States in which, so far as known, school libraries have received their greatest development, the former having 191 volumes and the latter 154 volumes for every one hundred pupils in average attendance. In the Southern States no public school libraries of any consequence are reported.

It is not possible, from want of data, to make summaries of the statistics of school libraries that would be of any use whatever.

High schools.—High school statistics in like manner are, and apparently must remain, in an unsatisfactory condition. There is no well-defined line outside of cities, as a general rule, separating high schools from other schools. In the rural districts schools, and even the studies of individual pupils, are of a mixed primary and secondary character. The high school statistics that are given, therefore, can lay no claim to accuracy or completeness in most cases, but are presented as being the best that could be collected from State superintendents, and as furnishing valuable indications of a general character.

The statistics of individual high schools are given in detail in another chapter of this Report (see Index).

By far the greatest public high school enrolment is found in the North among the older States. In the North Atlantic Division, out of every 1,000 pupils enrolled 64 are high school pupils. Maine leads in this point, 77 pupils out of every 1,000 enrolled in that State being high school pupils (Column 9).

With the exception of the District of Columbia, and an estimate by the State superintendent of Mississippi, no high school statistics are reported from the two Southern divisions. It is known, however, that in these divisions the great bulk of secondary instruction is or was given in private high schools and academies. In Georgia, at least, there is a constitutional provision forbidding any except the elementary branches being taught in the public schools at the charge of the public funds.

In the North Central States 23 pupils out of every 1,000, and in the Western States 17, are high school pupils. The average for all the States reporting is 35.

a Including only the States tabulated above.

PRIVATE SCHOOLS.

[Table 8, Page 69.]

The statistics of private schools, notwithstanding the importance that attaches to them, are of the most fragmentary character. One phase of educational activity, a definite knowledge of which is absolutely necessary to a full understanding of the subject, is thus left almost wholly unrecorded. Furthermore, the statistics that are given bear in some cases internal evidences of unreliability.

The obligations which should be imposed upon private school teachers, in the matter of reporting the statistics of their schools, have become a subject of discussion. In Connecticut legislative action has been taken which should result in a complete system of private school reports. Superintendent Orr, of Georgia, has urged the right of the State to require private school reports, and has defined the basis upon which this right rests. (See Index, under head of "Private schools.")

Growth of private schools.—It would be useful to compare the percentage of increase or decrease of the private school enrolment as given in Column 6 with that of the public school enrolment, to see if the public schools are more than holding their own. The abnormal results that are recorded for some of the States, however, in the column mentioned, would seem to indicate that either this year's or last year's report, as the case may be, was extremely defective.

The three North Atlantic States reporting apparently furnish the most reliable statistics of growth; enough so, perhaps, to enable a fair estimate to be made of the present prospects of private schools in that section. It will be found that while Vermont shows a decrease of .36 per cent. in public school enrolment, and Connecticut and New York an increase of only .20 and .98, respectively, the private school enrolment has increased 3.57 per cent. in Vermont, 5.13 in Connecticut, and 4.12 in New York. Those figures may be considered as establishing conclusively the fact that the private schools are gaining on the public schools in the States mentioned, and the presumption that they are so doing in the neighboring States.

Extent of private school enrolment.—Column 7 gives the proportion of pupils who are enrolled in the private schools. It shows that, so far as can be determined, private schools have received their greatest development in the North Atlantic Division, where 11.17 per cent. of all pupils are enrolled in private schools; that is, out of every 100 pupils enrolled in schools of all kinds, 11 are enrolled in private schools.

Illinois and California also show a large private school enrolment; Dakota a phenomenally small, perhaps imperfectly reported one. For all the States reporting 8.56 per cent. of their total enrolment is to be found in private schools, leaving 91.44 per cent. for the public schools.

Comparative enrolment to be found in all schools.—Column 6 of Table 3 gave the average number of pupils enrolled in the public schools for each 100 persons 6 to 14 years of age. Column 8 of the table under review gives the same, taking in also the pupils enrolled in the private schools; that is to say, it shows how many pupils are enrolled in all schools, public and private, for each 100 persons of the age mentioned. Table 3 gave only a partial view, *i. e.*, it was confined to the public schools. Table 8 gives a complete view, but unfortunately it is limited to a few States.

TEACHERS.

[Table 9, Page 72.]

Table 9 gives (1) the whole number of different teachers, classified by sex, and (2) the number necessary to supply the schools, or number of teachers' positions. This latter quantity does not admit of classification by sex, since any teacher's position may be occupied at one time by a man and at another time by a woman.

The number of teachers necessary to supply the schools, though reported from only comparatively few States, is the more important item of the two. It is the quantity which should be used, as a general rule, when the "number of teachers" is wanted; that is to say, though a number of different teachers may in succession occupy the same position in the course of a school year, they only count as one teacher for most statistical purposes.

The "whole number of different teachers" is wanted principally for determining questions of sex in teachers, and of frequency of change in the teaching force. It is, however, almost universally used, or rather misused, when the "number of teachers" is wanted for any purpose whatever, thereby vitiating the arguments or conclusions based upon it. Still it furnishes the only knowledge we have regarding the number of teachers in the majority of States and Territories.

Attention is called to this point for the purpose of emphasizing the great need that exists of having reported the number of teachers necessary to supply the schools.

The whole number of different teachers in the United States, according to the latest returns, is 338,637, an increase of 15,571 over the number last reported. This increase, however, possesses no particular significance, since it may arise from an increased number of changes in the existing teaching force instead of the establishment of new teachers' positions. What knowledge the Bureau has regarding the actual sufficiency of the teaching force is given in Column 8 of Table 4.

Sex of teachers.—A comparison of the increase of the whole number of male teachers with that of female teachers should show to what extent one sex has displaced the other during the year. As far as can be determined the number of male teachers in the United States increased at the rate of 2.63 per cent., female at the rate of 2.61 per cent., showing practically no change in the relative numbers of the two sexes for the country at large.

In the North Atlantic Division the male teachers would seem to be gaining in numbers, due to the heavy decrease of female teachers (20.90 per cent.) in New Hampshire.

In the next three divisions the female teachers have increased in greater proportion than the males. The large decrease of teachers in Mississippi is probably one of the results of the re-organization of the school districts of that State, securing fewer and larger schools. In the Western Division, again, the male teachers have gained in proportionate numbers.

The present relative number of teachers of each sex is given in Column 13. The different sections of the country present well-marked distinctions in this matter. In the North Atlantic States only 23 teachers out of every 100 are male; then come the North Central and Western Divisions, in which about one-third of all of the teachers are male; in the two Southern divisions the males are in the majority, in the South Central Division largely so.

Massachusetts has the smallest proportion of male teachers of any State or Territory, or about one in ten. In Arizona and Arkansas the proportion of male teachers is largest, being in each instance more than three-fourths of the whole.

Though no considerable change in the relative number of teachers of each sex has taken place during the year covered by this Report, yet when the last 10 years are taken into account a decided displacement of male teachers is apparent, extending through every section of the country, except in one instance. This displacement will be seen from the following tabular statement:

Percentage of male teachers at intervals of five years since 1876-77, computed from the Reports of the Bureau of Education.

Year.	The United States.	North Atlantic Division.	South Atlantic Division.	South Central Division.	North Central Division.	Western Division.
	<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>
1876-77	42.37	28.88	63.20	60.25	44.28	44.65
1881-82	39.39	26.11	58.66	67.46	38.14	36.27
1886-87	35.95	22.63	52.25	62.23	32.64	33.26

It will be observed that in the North Atlantic Division, where the relative number of male teachers was smallest in 1876-77, the displacement of males has been going on nearly as extensively as in any other section. Whether this process can continue without detriment to the best interests of the schools, especially as regards the education of the older boys, is a question worthy of serious consideration.

Changes in the teaching force.—Column 12 is designed to show the average number of changes in the teaching force to every 100 teachers' positions during the school year. This will be seen to vary exceedingly in the several States reporting the necessary data, so much so as to suggest a greater or less degree of inaccuracy in the reports made. The averages for the North Atlantic, North Central, and Western Divisions, however, are tolerably uniform, being 25.41, 23.60, and 27.15, respectively. The want of permanency in the teachers' position is one of the greatest drawbacks to the progress of the public schools to a higher degree of efficiency. Just to what extent this want of permanency exists can be determined in no better way than the one given, and it would be a matter affording peculiar satisfaction if the data required for the purpose were more accurate and complete.

SALARIES OF TEACHERS.

[Table 10.]

The average monthly salaries of male teachers have increased in 15 States and Territories, and decreased in 17, out of the 32 in which this change can be determined satisfactorily. As regards the salaries of female teachers, there has been an increase in 17 States and Territories, a decrease in 13, and no change in 2.

The greatest difference between the salaries of male and female teachers is met with in the North Atlantic and North Central Divisions; the least, in the South Atlantic Division.

The want of uniformity in the methods of computing the average wages of teachers has already been pointed out in previous Reports of the Office; so long as it continues to exist, no reliable comparisons of the wages of teachers in different States can be made. There is one method that is unqualifiedly incorrect, namely, taking the mean between the maximum and minimum salaries of a county or township as the average salary.

The average salary of all the male or female teachers of a State possesses no great degree of significance. The classification should be more in detail, distinguishing city from country teachers, and white from colored, in order to be useful as a guide in determining the remuneration of teachers.

SCHOOL REVENUE.

[Tables 11, 12, and 12A, Pages 76, 78, and 79.]

A consideration of school revenue is chiefly valuable for comparing the relative amounts derived from different sources in the several States.

The value of the results arrived at, however, is considerably vitiated through a want of uniformity in the classification of school revenue. As an instance of this, it may be said that certain revenues of essentially the same character in all the States are classed in some States as income from permanent funds, in others as income from State taxes, and in others still as income from local taxes. Also, taxes imposed by a State law, but retained and distributed in the communities where they were collected, are sometimes reported as State taxes and sometimes as local taxes. These taxes may be called compulsory local taxes, as they differ both from voluntary local taxes and from taxes paid into the State treasury and distributed therefrom on some general basis of population or attendance, which latter are State taxes proper. A more detailed classification would remedy the misunderstanding in this matter, were there any possibility of its being adopted.

State aid to education.—There may be noted a growing sentiment in favor of having more of the school revenues collected and apportioned by the State authorities according to population or attendance (see Index under the head of "Revenue"). The design is to equalize the school funds, so that all parts of a State may have a school term of equal length, or nearer equal than at present.

Ten States and Territories, all situated in the North and West, report no State tax whatever (Table 11, Column 3). In the North Central Division only 9.8 per cent. of all the school revenue (Table 12 A, Column 3) is raised by State taxes, hardly sufficient to give anything like equal school privileges to all the children in the States composing that division.

SCHOOL EXPENDITURES.

[Tables 13, 14, and 14 A, Pages 81, 83, and 84.]

The total amount expended for common schools in the United States during the school year 1886-87, or according to the latest reports, was \$115,103,886, an increase of \$3,798,959 over the amount last reported by this Office.

This amounted to an average expenditure of \$1.99 per capita of total population, \$10.27 per capita of population 6 to 14 years of age, and \$15.40 per capita of average attendance. The schools were kept open a mean length of 135 days (Table 5, Column 6), so that each dollar expended furnished about 9 days' schooling on an average.

The Northern and Western Divisions expended from three to five times as much per capita of population 6 to 14 as did the two Southern divisions. When the proportion of actual wealth expended is considered, however, the disparity nearly or quite disappears; though the statistics on this point are incomplete and unreliable, yet they show satisfactorily in a general way that the South is expending about as much relatively of its available means for education as the North. The average expenditure for all the States reporting the necessary data was 5.61 mills per dollar of assessed valuation.

By far the greatest expenditure per capita of average attendance (setting aside Alaska with its expenditure of \$59.72 per capita of average attendance) is met with in the Western Division where it averages \$25.12.

The amount reported as expended for salaries of superintendents and teachers is \$79,531,925, indicating a yearly increase of \$2,641,722, or at the rate of 3.44 per cent. per annum. This exceeds the rate of increase of either the school population or average attendance, as will be seen by reference to Table 16.

Of the total amount expended for schools, 14.42 per cent. was expended for sites, buildings, furniture, libraries, and apparatus; 69.10 per cent. for the salaries of superintendents and teachers; and 16.48 per cent. for all other purposes. (Table 14 A.)

It will be observed that the older North Atlantic States are expending proportionably quite as much of their school moneys for sites, buildings, etc., as the newer North Central States, and considerably more than the Western States. The least relative expenditure of this permanent character is met with in the Southern States, as might be expected from the low density of population and mild winter climate.

PERMANENT SCHOOL FUND, TOTAL ASSESSED VALUATION, AND VALUE OF SCHOOL PROPERTY.

[Table 15, Page 86.]

Permanent school funds.—Twenty-one States report permanent school funds yielding an annual revenue, nine of which are in the North Central Division. A number of other States are known to have some permanent funds not reported in the table. In some cases what was originally a permanent school fund has been so invested or disposed of that it is a mere matter of book-keeping whether it continues to appear as such or not, the practice varying in different States in that respect.

Texas has the largest permanent school fund, both present and prospective; on account of the defective returns from that State, however, it is impossible to say what proportion of her total school revenue, or what revenue per capita, is derived from it. Illinois has the next largest permanent fund, nearly twelve million dollars, though only 6.1 per cent. of her whole school revenue is derived from it (Table 12 A, Column 2). Alabama derives a larger proportion of her school revenue from permanent funds than any other State, depending on that source for nearly one-fourth of the whole, though the amount of the fund itself is not reported.

Total property valuation.—On account of the difference in the rates of assessment in the different States, conjoined to other circumstances, the statistics of total property valuation

tion are of a very uncertain character, and, as was stated in the last Report of this Office, can only be used as a general guide. They were introduced to meet the necessity that exists of providing some way of determining what proportion of their actual means the people of different localities are paying out for education. It may be that it would be preferable to compare the school expenditure with the expenditure for all purposes, State and local, as has been suggested by Superintendent Bettison, of New Orleans, were there not difficulties in the way of determining the latter quantity satisfactorily.

School property.—The value of school property has increased at a much greater rate, in every section of the country, than either the school population or attendance. (See also Table 16.) The average yearly increase in the value of school property for all the States reporting was 6.22 per cent., while that of school population was only 2.61 per cent. and that of average attendance 2.89 per cent. In the State of Missouri alone the increase in the value of school property was close upon two million dollars.

The present value of school property, as related to population, attendance, etc., is given in Columns 12 to 15 inclusive.

TABLE 15.—PERMANENT SCHOOL FUNDS, TOTAL ASSESSED VALUATION, AND VALUATION OF SCHOOL PROPERTY.

g Excluding Alaska.

h Approximately.

TEN YEARS' GROWTH OF THE PUBLIC SCHOOL SYSTEM.

[Table 17, Page 91.]

The general lines of development of the public schools of the different parts of the United States for the last ten years are indicated in Table 17. In this table it is clearly demonstrated that the growth of the public school system, taking into account the average for the United States, has not only kept pace with the growth of population, but has outstripped it.

While the population of the United States 6 to 14 years of age has increased 29 per cent. during the last decade, the enrolment in the public schools has increased 31.1 per cent., showing that there is an increase of 1.6 per cent. in the proportion of children 6 to 14 enrolled.

EDUCATION IN THE SOUTH.

This increase in the proportion of school children enrolled is due entirely to the growth of the public schools of the two southern divisions, which are the only ones in which the public school enrolment has increased at a greater rate than the population 6 to 14. In the South Central Division, especially, the growth in school enrolment, as compared with the increase of school population, has probably never been paralleled in a country so long settled; the school enrolment has, in fact, in the division referred to, nearly doubled during the decade, while the population 6 to 14 has only increased by about one-third.

From the relative increase of population 6 to 14 and enrolment, it may be deduced that the proportion of school population enrolled as pupils has increased 25.3 per cent. in the South Atlantic Division, and 34.1 per cent. in the South Central Division. In the three northern and western divisions there has been a decrease, amounting to 9.3, 1.7, and 8 per cent., respectively.

The actual proportion of children enrolled in the public schools (Table 3, Column 6) is still at the present time less in the South than in the North. If the extension of the public school system in the South, however, should continue at the marvellous and unprecedented rate it has exhibited during the past decade, the two sections would be placed nearly on an equal footing in this respect (though not in regard to length of school term). Whether such will prove to be the case will probably depend on the growth of the South in material prosperity. It has already been shown that, as near as can be ascertained, the people of that section are paying nearly as largely of their means for education as those of the North (Table 14, Columns 5 and 9). Any further considerable development of their public school system will probably depend, therefore, on their increased ability to bear the expense, *i. e.*, on the increase of their property per capita of population.

EXPENDITURE.

The increase of expenditure has in every geographical division grown at a greater rate than the increase of population 6 to 14; that is to say, the expenditure for schools per capita of population 6 to 14 has increased in all the different groups of States in which it has been summarized. This increase in per capita expenditure is least in the Western Division (2.2 per cent.), greatest in the South Central Division (20.9 per cent.), and averages 9.4 per cent. for the United States.

On account of the inordinate increase of enrolment in the South, however, the increase in expenditure has not been able to keep pace with it; so that the expenditure *per capita of enrolment* shows a small decrease in the two southern divisions. This is a result that might have been anticipated from a school enrolment growing to such a degree that it has begun to tax to the utmost the ability of the people to provide for it.

The status of education in the South, it may be remarked, can not be properly considered without a reference to the fact that the funds for educating both the whites and colored people are, and must continue to be, supplied in the main by the whites. Further reference is made to this point in another chapter.

In the three northern and western divisions the expenditure per capita of enrolment has largely increased, allowing longer school terms, and higher wages for teachers.

The following tabular summary has been computed from Table 17, and presents a more complete view of some of the data made use of in the preceding remarks:

Percentage of increase during a decade.

[1876-77 to 1886-87.]

[NOTE.—Dec. indicates a decrease.]

Group of States.	Increase in the number of pupils enrolled to every 100 children 6 to 14.	Increase in the expenditure per capita of population 6 to 14.	Increase in the expenditure per capita of enrolment.

EDUCATION IN THE NORTH AND WEST.

It may be noted here that the proportion of children 6 to 14 years of age enrolled in the public schools has decreased only in those divisions in which compulsory attendance laws are generally in force, and in each one of these there has been a decrease.

It is possible that this decrease has been offset, or more than offset, by an increase in private school enrolment. On this point no satisfactory knowledge can be obtained on account of the general absence of private school statistics.

Whether, however, the private schools have absorbed the children who might have swelled the public school enrolment, or whether such children are out of school altogether, the fact remains that the public schools of the three divisions referred to seem to have been on the wane during the past decade, and that they do not gather in as large a proportion of the school population as they did ten years ago, although more money is expended upon them.¹ This is a matter of the highest gravity, and requires serious consideration. Has the public school system reached and passed its maximum phase in the North and West? Is universal education by the State an abstraction not to be realized in the concrete?

The disclosures made by the tables which are given in this connection impart new significance to the remark made by Superintendent Le Roy D. Brown at a recent meeting of the Department of Superintendence of the National Educational Association: "Strange it would be if a growth, at once so rapid and luxuriant, should be altogether sound and enduring!"

¹As to the causes at work to produce the falling off in the proportion of children enrolled in Connecticut, see page 114.

²Bureau of Education, Circular of Information No. 3, 1887, p. 64.

TABLE 18.—CHIEF STATE SCHOOL OFFICERS.

[NOTE.—This list has been revised to date of going to press.]

Name.	Address.	Official title.
Solomon Palmer-----	Montgomery, Ala----	State superintendent of education.
Woodville E. Thompson	Little Rock, Ark----	State superintendent of public instruction.
Ira G. Hoitt-----	Sacramento, Cal ----	Do.
Leonidas S. Cornell ----	Denver, Colo -----	Do.
Chas. D. Hine-----	Hartford, Conn-----	Secretary of State board of education.
J. H. Caldwell-----	Newark, Del.-----	President of State board of education.
Albert J. Russell-----	Tallahassee, Fla----	State superintendent of public instruction.
James S. Hook-----	Atlanta, Ga.-----	State school commissioner.
Richard Edwards-----	Springfield, Ill-----	State superintendent of public instruction.
H. M. La Follette-----	Indianapolis, Ind.---	Do.
Henry Sabin-----	Des Moines, Iowa---	Do.
J. H. Lawhead-----	Topeka, Kans-----	Do.
Jos. Desha Pickett-----	Frankfort, Ky-----	Do.
Joseph A. Breaux-----	Baton Rouge, La-----	State superintendent of education.
Nelson A. Luce-----	Augusta, Me.-----	State superintendent of common schools.
M. A. Newell-----	Baltimore, Md-----	State superintendent of public instruction.
John W. Dickinson-----	Boston, Mass-----	Secretary of State board of education.
Joseph Estabrook-----	Lansing, Mich-----	State superintendent of public instruction.
D. L. Kiehle-----	Saint Paul, Minn.---	Do.
J. R. Preston-----	Jackson, Miss-----	State superintendent of education.
Wm. E. Coleman-----	Jefferson City, Mo---	State superintendent of public schools.
Geo. B. Lane-----	Lincoln, Nebr-----	State superintendent of public instruction.
W. C. Dovey-----	Carson City, Nev-----	Do.
James W. Patterson-----	Concord, N. H.-----	Do.
Chas. W. Fuller-----	Trenton, N. J.-----	Do.
Andrew S. Draper-----	Albany, N. Y.-----	Do.
Sidney M. Finger-----	Raleigh, N. C.-----	Do.
Eli T. Tappan-----	Columbus, Ohio-----	State commissioner of common schools.
E. B. McElroy-----	Salem, Oregon-----	State superintendent of public instruction.
E. E. Higbee-----	Harrisburg, Pa.-----	Do.
Thos. B. Stockwell-----	Providence, R. I.---	Commissioner of public schools.
James H. Rice-----	Columbia, S. C.-----	State superintendent of education.
Frank M. Smith-----	Nashville, Tenn-----	State superintendent of public schools.
Oscar H. Cooper-----	Austin, Tex.-----	State superintendent of public instruction.
Justus Dartt-----	Springfield, Vt.-----	Do.
John L. Buchanan-----	Richmond, Va.-----	Do.
Benj. S. Morgan-----	Charleston, W. Va-----	State superintendent of free schools.
Jesse B. Thayer-----	Madison, Wis.-----	State superintendent of public schools.
Sheldon Jackson-----	Sitka, Alaska-----	General agent of education for Alaska.
Charles M. Strauss-----	Prescott, Ariz-----	Superintendent of public instruction.
E. A. Dye-----	Mellette, Dak-----	Do.
Wm. B. Powell, white } G. T. Cock, colored-- }	Washington, D. C.---	Superintendent of District schools.
Silas W. Moody-----	Boisé City, Idaho-----	Superintendent of public instruction.
A. C. Logan-----	Helena, Mont-----	Do.
Trinidad Alarid-----	Santa Fe, N. Mex-----	Ex-officio superintendent for reports.
P. L. Williams-----	Salt Lake City, Utah-----	Superintendent of public instruction.
J. C. Lawrence-----	Olympia, Wash. T.-----	Do.
John Slaughtier-----	Cheyenne, Wyo.-----	Do.

CHAPTER III.

DIGESTS OF STATE SCHOOL REPORTS.

ALABAMA.

[From Report of State Superintendent Solomon Palmer, 1886-87.]

The schools of Alabama during the past year have been in as prosperous a condition as the meagre school revenues permitted. "The pressing want of our school system," says Superintendent Palmer, "is more money, that the public schools may continue a longer period each year, and that our teachers may be paid better salaries. Notwithstanding the fact that the system is sorely crippled in its operations for the want of adequate funds to meet the constantly growing demands upon it, there is no doubt of its increasing popularity and usefulness. The advantages to be derived from a good school system are more keenly felt by the great body of the people of the State to-day than ever before in its history."

CHANGE IN THE PLAN OF THE REPORT.

The statistical tables and summaries of the report include only the country schools. Special reports are given from the cities and separate school districts. These reports, however, are not upon any uniform plan, so that it is not possible to get exact totals for the State except upon one or two points. Alabama is thus placed upon a different plane from the other States as regards her educational statistics, and is not comparable with them. There is no question as to the desirability, for certain purposes, of separating the statistics of the country from those of the city schools in all the States; without so doing, States with a large urban population can not be justly compared in many respects with the more sparsely settled States. But it is necessary to have in addition a general summary for the whole State.

COMPARATIVE STATISTICS.

During the scholastic year there were—

Enrolled in white schools.....	153,304
Enrolled in colored schools.....	98,396

Total enrolled.....	251,700
---------------------	---------

Average daily attendance in white schools.....	93,723
Average daily attendance in colored schools.....	63,955

Total daily attendance.....	157,718
-----------------------------	---------

Of the enrolment the attendance was 63 per cent.—of whites 61 per cent., of colored 65 per cent.

Number of schools for white.....	3,658
Number of schools for colored.....	1,925

Total schools taught.....	5,583
---------------------------	-------

Teachers in white schools, males.....	2,413
Teachers in white schools, females.....	1,237
	3,650

Teachers in colored schools, males.....	1,264
Teachers in colored schools, females.....	569

Total teachers in colored schools.....	1,833
--	-------

Total teachers employed.....	5,483
------------------------------	-------

These statistics are very near the same as those in last report. If the cities were included in this they would show a gratifying increase during this year.

Average monthly pay of white teachers.....	\$22.16
Average monthly pay of colored teachers.....	21.58
Average monthly pay of teachers.....	21.87

Decrease in white \$5.43, and in colored \$4.39 since last report.

Average paid each teacher.....	\$82.83
A decrease of.....	\$29.96
Average enrolment to white teacher.....	33
Last year it was.....	39
Average enrolment to colored teacher.....	45
Last year it was.....	48
Average cost of pupil per month, on basis of enrolment.....	cents. 54½
Average cost of pupil per month, on basis of attendance.....	do. 84
Last year on enrolment.....	45½
Last year on attendance.....	do. 75½
Average length of schools in days, white.....	70
Average length of schools in days, colored.....	71
Average length of schools in days.....	70½
Average length of schools in days, white, last year.....	87½
Average length of schools in days, colored, last year.....	87½
Average decrease since last report.....	16½

The marked decrease in these figures, as before explained, is on account of the omission of the cities and separate school districts; were they included there would be but little change since last report.

It might be of interest to note a few changes in the past ten years:

In 1876-77, pupils enrolled.....	143,571
In 1886-87, pupils enrolled.....	251,700
Increase in ten years.....	108,129
In 1876-77, schools taught.....	4,175
In 1886-87, schools taught.....	5,583
Increase in ten years.....	1,408
In 1876-77, poll-tax collected.....	\$116,627.41
In 1886-87, poll-tax collected.....	136,805.75
Increase in ten years.....	20,268.34

SCHOOL CENSUS—REDUCTION OF THE PER CAPITA.

The school census of August, 1887, shows for the whole State a total increase of children of school age (7-21) in two years of 32,614. Speaking of the effect of this increase upon the apportionment of the school revenues, Superintendent Palmer says that "the reduction in the per capita of the colored is larger than that of the whites on account of the liberal appropriations made by the last Legislature out of the fund for that race for the university for the colored people and for normal schools. It should be borne in mind that this reduction in the per capita occurs notwithstanding the additional appropriation of \$20,000 to the school fund made by the last Legislature. But for this appropriation the per capita would have been reduced some 4 cents lower than it was. These figures must impress every thoughtful person who desires the prosperity of the State and values the intellectual and moral culture of the young with the fact that, to make our public school system what it ought and must be,

MORE MONEY IS NEEDED.

"In point of material resources and natural advantages Alabama is surpassed by no State in the Union. Capital as never before is seeking investment within her borders. The demand of the times is a public school system with adequate funds to place the blessings of at least an elementary education within the reach of every child in the State. Possessed of such a system, no State in the Union would have so bright a future as Alabama. But, if in our haste to grow rich, we neglect our public school system and the intellectual and moral training of our youth, these natural advantages and boundless resources may prove a snare and a curse by enticing to our State a mass of ignorant immigrants who care not for education, who regard not our long-cherished institutions, and who are enemies to a higher and more ennobling civilization. But if we foster our public school system and make it the pride of our citizens, as many of our sister States have done, we will be blessed with a thrifty, enterprising class of immigrants, who appreciate and who have been accustomed to free public schools for their children, and who will invest their money among us and heartily co-operate with us in developing our State and in perpetuating our free institutions. To such a class of immigrants, a public school system that pays no more than \$1 per child, including poll tax; that pays teachers on an average only \$21.87 per month; that runs its free public schools only 70½ days in the year, and that does not pretend to provide any school buildings, is not very inviting."

After introducing statistics to show how much more Michigan, Arkansas, and Tennessee are paying for public schools than Alabama, the superintendent continues: "With the foregoing figures before us it is not so surprising that in 1880 the census

shows that Alabama, out of a population of 1,262,505, had 433,447 over the age of 10 years who could not write, while Michigan, with her splendid school system, out of a population of 1,648,690, had only 63,723, and Arkansas, out of a population of 802,525, had only 202,015, and Tennessee, out of a population of 1,542,359, nearly 300,000 larger than Alabama, had only 410,722 illiterates.

"This difference may, it is true, be accounted for in some measure by the large illiterate negro population of the State, but it must be admitted by every one not blinded by prejudice that our meagre appropriations for public schools causes in no small degree this difference so disparaging to Alabama, when compared even with other Southern States.

"One of our wisest statesmen recently said 'that no State in the Union is more deeply interested in the cause of popular education than Alabama.' After citing the fact that more than 96,000 voters in the State could not read the ballots which, as freemen, they are empowered to cast for the weal or woe of their country, he asks with pertinency and much force, 'How can we, with such a mass of ignorance exercising the great privilege of suffrage, hope to perpetuate the life and continued prosperity of our free institutions?'

"How to dispel this dark cloud of illiteracy that hangs over our State, shrouding all in gloom and obscuring our prospects for the future, is the practical question that should engage the mind and stir the heart of every patriot and lover of humanity. There is no better way of rifting this cloud of illiteracy than by letting in the rays of intellectual light into the minds of the young, or of dispelling the gloom that it engenders than by instilling in their young hearts correct principles and habits of living, which can and should be done by every teacher of our public schools. These schools are the available means for the intellectual and moral training of our young, and it is the highest duty of the State to sustain them, but to do this as it should be done, more money is necessary.

"Upon the imperative duty of the State to provide the means for the education of her children, I hope to be excused for making the following apt quotation from a speech of Lord Macaulay, one of the greatest historians, most brilliant writers, and ripest scholars of the past century:

"I say, therefore, that the education of the people ought to be the first concern of a state, not only because it is an efficient means for promoting and obtaining that which all allow to be the main end of government, but because it is the most efficient, the most humane, the most civilized, and in all respects the best means of obtaining that end. This is my deliberate conviction, and in this opinion I am fortified by thinking that it is also the opinion of all the great legislators, of all the great statesmen, of all the great philosophers of all ages and of all nations, even including those whose general opinion is and has ever been to restrict the functions of government."

"Strong as the foregoing is, it is not stronger than the following from that peerless orator and wise statesman, Seargeant S. Prentiss, of Mississippi, taken from a speech delivered in New Orleans in 1846:

"The principle that society is bound to provide for its members' education as well as protection (protection of person and property), so that none need be ignorant except from choice, is the most important that belongs to modern philosophy. It is essential to a republican government. Universal education is not only the best and surest, but the only sure foundation for free institutions. True liberty is the child of knowledge; she pines away and dies in the arms of ignorance."

LOCAL TAX RECOMMENDED.

"In my former reports I have frequently expressed the hope that a sentiment favorable to local taxation for school purposes might be awakened in the minds of the people of the State, and earnestly urged its importance as the best available means of securing sufficient funds to make a public school system efficient. But in this my hopes were blasted by a decision of our Supreme Court in a case brought up from the separate school district of Cullman, in which the Supreme Court held that such a tax was in violation of our constitution. The only chance to increase our school fund by means of local taxation is to have our fundamental law amended. This should be done, as we can not hope to make our school system what it ought to be without local taxation. As may be above seen, Michigan derives more than one-half of her ample school fund from local taxation. But a change of our fundamental law is not only uncertain, but at best its accomplishment requires time, and we can not afford to wait for this to be done."

In addition to the district of Cullman, mentioned by Superintendent Palmer, many communities, small towns, and country neighborhoods, says the Montgomery Advertiser, asked and obtained from the Legislature a special act authorizing them to levy a local tax for schools. These special acts were declared unconstitutional by the Supreme Court, as above stated; but the fact that they were called for is conclusive evidence of the strong public sentiment in favor of free schools, and of the willingness to support them by voluntary local taxes, in addition to the State apportionment.

A STATE TAX PREFERABLE TO AN APPROPRIATION.

"Our only hope, so far as the State is concerned, is to increase the direct appropriation from the State. The people of the State have manifested a willingness to do this, as has been repeatedly expressed by their representatives in the Legislature by an increase of the appropriation for schools within the past few years from \$130,000 to \$250,000. It is confidently hoped that by the time our next Legislature convenes that the values of the taxable property of the State will have so increased that an additional appropriation for school purposes may be made without risk of impairing the State's credit. A better plan still, in my judgment, would be to levy a special tax of say three mills on taxable values, to be used exclusively for public schools. I believe in this way the people would more willingly pay this tax, knowing that it could never be diverted from the sacred purpose for which it was raised, and that it would be returned to them ten-fold in the enhanced valuation of their property, and better still, in the education of their children free of cost."

POLL TAX.

"There was no material difference between the school funds of the two preceding years' except in the amount of poll tax collected. There has been a very decided falling off in the poll tax, both in the amount of assessments and collections, but especially in the latter. The poll tax collected for the year ending September 30, 1886, was \$144,962.37, while that for the past year was only \$135,572.34, a falling off of \$9,390.03. There was a failure on the part of the collectors in Elmore and in Sumter Counties to pay over to the county superintendents all the poll tax due the school fund in these counties, but this only amounts to a few hundred dollars and will not account for this difference. * * * By an examination of preceding reports it will be seen that the collections of poll tax are no more than they were several years ago. It is true that this failure to collect polls is chiefly in the 'black belt,' as it is sometimes termed, where the colored race are most numerous; but I feel sure that by greater vigilance on the part of collectors, and more rigid scrutiny on the part of commissioners' courts, much more poll tax could be collected to increase the school revenues of the State than has been done the past year. By an act of the last Legislature the collector is charged with the collection of the insolvent polls of the preceding year, a much better plan than that of turning the lists over to the justices of the county, as required by the old law. The aggregate of errors and insolvencies allowed the past year amounts to \$72,782.63, nearly one-third of the entire assessment, and more than half as much as was collected. This is not creditable to our people and does not manifest the interest in education that should be shown by those who so sorely need the blessings of a public school system.

SCHOOL LANDS.

"It will be seen that there has been collected, during the year, on claims for school lands, the sum of \$8,855.79. It is to be regretted that the records of this office are so defective, caused, no doubt, by the confusion resulting from the Civil War, that it is impossible to ascertain, with any degree of certainty, what particular subdivisions of school lands were purchased by those persons against whom the State holds claims; and, in many cases, parties claim that they have made full payment for school lands when the record fails to show any payments; and in some cases, lands were sold before the war, and there is no evidence in this office of any such sales. It is very desirable both for the State and for the persons claiming these lands that the question of title should be settled, and patents issued to those entitled to them, and the claim of the State enforced against those who have not paid for the school lands claimed and used by them. During the year there has been constant inquiry about title to school lands, caused, no doubt, by the fact that these lands are becoming more valuable. It is to be hoped that county and township superintendents will take advantage of the favorable opportunity offered by the demand for these lands to secure settlements of these old claims held by the State. In many cases parties have been in the adverse possession of these lands for twenty and thirty years, claiming that the purchase money has all been paid, and yet there is no pretence that the State has been divested of her legal title to them. In such cases the interest of the claimants demands that they should have these questions settled, and should secure a patent from the State under compromise act, approved March 1, 1881. Quite a number of settlements under this act have been effected during the year, and considerable money certified into the State treasury to the credit of the school fund of the townships in which the land lies."

ARBOR DAY.

"In compliance with a request made by the Southern Forestry Congress, and in accordance with a beautiful custom that is prevailing in well nigh every State in the Union, I requested the schools of the State to observe the 22d of February, George Wash-

ington's birth-day, as Arbor Day, by planting shade trees and shrubbery on their school-grounds, and dedicating them with appropriate ceremonies to the memory of those they love.

"Notwithstanding the fact that the appointed day was most unfavorable, by reason of heavy rains, hundreds of schools observed the day, and thousands of trees were planted and dedicated amid the songs of the joyous children."

"That the day may continue to be observed until such results are obtained, I hereby designate the 22d of February as Arbor Day, and request its proper observance by all the schools of the State."

For other information relating to education in Alabama consult the Index.

ALASKA.

The following rules and regulations were issued by the Secretary of the Interior on June 15, 1887:

RULES AND REGULATIONS FOR THE CONDUCT OF PUBLIC SCHOOLS AND EDUCATION IN THE TERRITORY OF ALASKA.

By virtue of the power conferred upon the Secretary of the Interior by the Act of Congress of May 17, 1884, authorizing him to make needful and proper provision for the education of children of school age in the Territory of Alaska, without reference to race, until such time as permanent provision shall be made for the same, the following rules and regulations for the government of the public schools in Alaska are hereby promulgated:

I.—General Management.

SEC. 1. The general supervision and management of public education in Alaska is hereby committed to the Commissioner of Education, subject to the direction and control of the Secretary of the Interior.

SEC. 2. There is hereby organized in the Territory of Alaska a board to be known as the Territorial Board of Education, to whom shall be committed the local management of the schools in that Territory, subject to the general management and supervision of the Commissioner of Education.

The Governor of the Territory, the judge of the United States court for the time being, and the general agent of education in Alaska shall constitute this Board of Education, and the general agent shall be secretary of said board and shall keep a record of its proceedings.

SEC. 3. The regular meetings of the Board of Education shall be held, at such times as said board may appoint, in the town of Sitka, in said Territory.

SEC. 4. The Territorial Board of Education shall have power, subject to the approval of the Commissioner of Education—

(a) To select and appoint the teachers of the public schools, to prescribe their duties, and to fix their salaries;

(b) To provide general rules for the government of the schools and the attendance of the children;

(c) To prescribe the series of text-books to be used in the public schools and to require all teaching to be done in the English language;

(d) To select the location and supervise the erection of the school-houses, to provide plans for the same, and to lease houses for school purposes.

SEC. 5. Requisitions for all materials for the erection of school buildings, articles of school furniture, supplies of books, stationery, and other necessary materials for the use of the schools must be made by the Territorial Board of Education upon the Commissioner of Education, and when such requisitions are approved by the Commissioner they will be transmitted to the Secretary of the Interior for his approval, and, when approved by him, the supplies will be purchased by the Commissioner of Education, and paid for as hereinafter provided.

SEC. 6. The Board of Education, at least three months in advance of the close of the scholastic year, shall submit to the Commissioner of Education detailed estimates of the probable necessary expenses for the support of the Territorial schools for the next fiscal year, including therein the erection of school buildings, the pay of school officers and teachers and other employés, travelling expenses of the general agent and the district superintendents, rents, fuel and lights, furniture, school books, apparatus, and all other necessary expenses for the maintenance of the schools.

SEC. 7. All salaries, expenditures, and other claims for the payment of educational expenses in Alaska must be audited by the Territorial Board of Education, approved by the Commissioner of Education, and, when approved by him, transmitted to the Secretary of the Interior for his approval, and when so approved, will be paid out of the funds appropriated by Congress for the education of the children of the Territory.

SEC. 8. In cases of special emergency the Board of Education may incur expenditures for immediate necessary school purposes in advance of the approval of the Commissioner of Education, but such liabilities shall be only for unforeseen and necessary purposes, and shall in no case exceed \$100.

SEC. 9. Whenever such extraordinary expense is incurred the Board shall make an immediate report thereon, in writing, to the Commissioner of Education, setting forth the reasons for incurring said expense, and transmitting properly signed and audited vouchers for the payment thereof.

SEC. 10. In the preparation of estimates, vouchers, and other official forms and papers the blanks approved by the Treasury and Interior Department will be used by the Board of Education.

SEC. 11. For his services each member of the Territorial Board of Education hereby established shall receive the sum of \$200 per annum.

SEC. 12. At the close of the school year the Territorial Board shall make a report to the Commissioner of Education, transmitting the hereinafter-mentioned report of the general agent, and containing their opinions and recommendations respecting the subjects thereof, and such other topics as shall be deemed by them proper for the general welfare of education in Alaska.

II.—The General Agent.

SEC. 1. A superintendent of education, to be known as the general agent of education in Alaska, shall be appointed by the Secretary of the Interior, and shall hold the position during the pleasure of the Secretary, and until his successor is appointed.

He shall receive from the Government for his services as general agent an annual salary of \$1,200.

SEC. 2. The general agent of education shall reside at Sitka, and shall be provided with an office, with the necessary furniture, stationery, fuel, and lights. He shall not leave the Territory without the written permission of the Secretary of the Interior.

SEC. 3. It shall be the duty of the general agent to exercise general supervision and superintendence over the public schools and teachers in the Territory, subject to the approval of the Territorial Board of Education.

SEC. 4. He shall visit each school district and each school in the district of Sitka at least once a year. He may, once a year, in each district hold a teachers' association at such time and place as in his judgment will best promote the interests of the public schools. The schools in the district of Sitka shall be under his immediate supervision.

SEC. 5. The general agent shall make a report at the end of the school year to the Territorial Board of Education, which report shall embrace—

(a) The number and general condition of the schools in the Territory.

(b) The rules and regulations prescribed by the Board of Education for the government of the schools and the duties of the teachers.

(c) The number of children between the ages of six and twenty-one years in the Territory, the number of children attending the public schools, the number attending other schools, and the number not attending any school.

(d) The names, ages, residence of the teachers and other officers employed in the schools, and the amount of their respective salaries.

(e) The time spent by the general agent in the Territory and the time spent by him in visiting the schools.

(f) And any and all information and suggestions that may be useful for the advancement of education in the Territory, or that may be required by the Commissioner of Education.

SEC. 6. It shall be the duty of the general agent to keep an inventory of school books, school furniture, and other property received by him from the Government, and at the end of his term of office he shall deliver to his successor all of the books and papers of his office, taking a receipt therefor.

III.—School Districts.

The Territory of Alaska is divided into three school districts, which shall conform to the geographical divisions known as Sitka, Kadiak, and Unalashka, as follows:

SEC. 1. Sitka, comprising all Southeastern Alaska, with an area of 28,980 square miles.

SEC. 2. Kadiak, comprising the region from Mount Saint Elias westward to Zakharoff Bay, with an area of 70,884 square miles.

SEC. 3. Unalashka, comprising the region from Zakharoff Bay westward to the end of Aleutian Islands, and northward to the Arctic Ocean, with an area of 431,545 square miles.

SEC. 4. In the districts of Kadiak and Unalashka the district superintendent, the United States deputy collector of customs, and the United States commissioner at Kadiak and Unalashka shall constitute and are hereby appointed a school committee. The supervision of the schools in these districts shall be under these committees, and all reports of the progress and condition of the schools, with recommendations for the location of new schools, and for the erection and repair of school buildings, shall be made to the general agent by said committees, and for their services as members of such committees the deputy collectors and commissioners shall be allowed \$100 each per annum.

SEC. 5. In each of these two last-named districts or divisions the Territorial Board of Education shall appoint one of the teachers to act as district superintendent. These superintendents shall visit the schools of their districts at least once a year, and keep the general agent informed of their condition and wants as to school buildings, the manner in which the teachers perform their duties, and all reports shall be made to the general agent by the superintendents through the committees of their districts. The district superintendent, in addition to his salary as teacher, shall be paid the sum of \$200, which shall be in full payment of his services and travelling expenses as such superintendent.

SEC. 6. The children shall be taught in the English language, and the use of school books printed in any foreign language will not be allowed. The purpose of the Government is to make citizens of these people by educating them in our customs, methods, and language. The children are primarily to be taught to speak, read, and write the English language. Vocal music may also be taught in the schools.

SEC. 7. The Sitka training school should teach the primary branches of industrial education. The boys should be taught shoemaking, carpenter and cabinet work, printing, and such other trades as are of use in the Territory, while the girls should be instructed in intelligent housekeeping and household industries.

SEC. 8. A common school should be established in every settlement where there are children in sufficient number, and at least one school in every tribe of Indians or native settlement.

Comfortable school-houses must be provided. These schools must be open to all children without reference to race.

L. Q. C. LAMAR,
Secretary of the Interior.

The organization of the board of education provided for in the above rules and regulations has already been referred to in Chapter I (see p. 32). The board met at Sitka July 14, 1887. Judge Lafayette Dawson was chosen president of the board, and Dr. Sheldon Jackson, general agent of education for Alaska, secretary.

Following is the report of the general agent to the Territorial board of education, together with the letter of the board transmitting the report, with recommendations, to the Commissioner of Education.

LETTER TRANSMITTING REPORT OF GENERAL AGENT.

SITKA, ALASKA, November 17, 1887.

SIR: We have the honor to transmit to you the annual report of the educational agent for Alaska, with our approval, except the recommendation, on page 57¹, of a division of the field.

We consider a division of the district unnecessary—that it would only complicate and retard the educational interests of Alaska.

But we would recommend one superintendent or general agent for the whole district, at a salary of not less than \$2,500 per annum, and that he be compelled to remain in the Territory and give his undivided personal attention to the Government schools.

Action of the Territorial board of education in Alaska.

SHELDON JACKSON, *Secretary.*

TO HON. N. H. R. DAWSON,
*United States Commissioner of Education,
Washington, D. C.*

¹ Page 111 of this Report.

REPORT OF THE GENERAL AGENT.

OFFICE OF THE GENERAL AGENT OF EDUCATION IN ALASKA,
Sitka, Alaska, June 30, 1887.

To the TERRITORIAL BOARD OF EDUCATION:

SIRS: In accordance with the recent regulations received from the Hon. N. H. R. Dawson, United States Commissioner of Education, I have the honor to send you my second annual report as general agent of education in Alaska.

This report covers the period from July 1, 1886, to June 30, 1887.

But few of the friends of Alaskan education, outside of her borders, realize that this Territory is without roads, horses, stages, and railroads, and much the larger portion without steamers or other means of regular communication with the outside world.

A monthly line of mailsteamers reaches Sitka and a few points in southeastern Alaska, and that is all; and when tourists make the grand excursion to Alaska, they only sail among the islands in one small corner of the country.

The great main-land of Alaska, with its smoking volcanoes, mammoth hot springs, highest mountains, largest glaciers, grandest rivers, wildest scenery, teeming animal life, and strangest natural phenomena, unvisited and unseen, stretches away two thousand miles beyond them.

And not only is Alaska largely cut off from the outside world, but in a certain sense it is cut off from itself; that is, there are no public means of intercommunication between its widely-separated sections. The private steamers of the Alaska Commercial Company, a few whaling vessels, an occasional trading schooner, and the Revenue Marine steamer, on their annual cruise to Behring Sea, are the only vessels seen in its waters, and they only for a few months in summer.

When, therefore, the United States Government was led to undertake the establishment of public schools in Alaska it was met at once with the difficulty of transportation. This proved so serious that the Government was compelled to be content the first year with taking charge of the schools in southeastern Alaska previously established by the Presbyterian Board of Home Missions. The only exceptions were the schools at Unalashka and on the Kuskokwim River.

Very unexpectedly a teacher was able to reach the former on a steamer chartered for another purpose. To reach the latter the Moravian Church, which took the contract for conducting the school, chartered a schooner at San Francisco, which conveyed the teacher and his party 4,479 miles to the mouth of the river. The material for the houses, school supplies, and supplies for the household were then transferred to row-boats, which carried them to their destination, 150 miles up the river. The same vessel that conveyed the teacher carried the lumber and hardware for the necessary buildings, the family furniture, the school appliances, and provisions for twelve months. They left San Francisco on the 3d of May, 1885, and it was the middle of the following August before all the building material reached its destination, at Bethel. This was the Moravian party of Rev. and Mrs. William H. Weinland, Rev. and Mrs. John H. Killbuck, and Mr. Hans Torgersen.

When, therefore, in 1885 the responsibility of establishing schools in all sections of Alaska was placed upon the Hon. John Eaton, United States Commissioner of Education, he was greatly embarrassed by his inability to secure reliable and explicit information concerning the educational needs of the villages of civilized Creoles, Aleuts, and Eskimaux in southern and southwestern Alaska.

Application was made to and instructions received from the Honorable the Secretary of the Navy, directing the commanding officer of the United States ship *Pinta* to take the general agent on a trip of inspection along the coast.

A combination of circumstances prevented the ship from making the trip.

It was then decided that the only practical way of securing the information absolutely necessary for the intelligent action of the Government was to send a special vessel under the control of the general agent.

Nothing could be done, however, until the amount of the appropriation for 1886-87 should be known. The appropriation was not made until the 4th of August, 1886.

Immediately upon the passage of the bill I was authorized to charter the schooner *Leo*, and by September 3 teachers had been summoned from Texas, California, and Washington Territory, the vessel loaded with lumber for school-houses, family furniture, and supplies, and we were on our way to sea. The authority to charter the vessel was given by Hon. John Eaton, by letter dated on the 4th day of August, 1886, as shown by a copy of his letter among the papers. The schooner was chartered from John G. Brady, of Sitka. The cost of the trip was \$4,535, which was paid to Brady on the 1st of February, 1887, out of the appropriation, as per voucher on file.

The cruise proved a stormy one, consuming 104 days. Passing through the equinoctial storms, we encountered the early winter gales of that high northern latitude.

Laying our course for Atkha, one of the Aleutian group of islands, the storms finally landed us, September 21, at Kadiak, 900 miles to the eastward of our destination. Ka-

diak Island is the western limit of forests along the southern coast of Alaska. It is also near the eastern limit of the Innuited, or civilized Eskimau population.

The first European or Russian settlement on this island was made by Gregory Shelikoff in 1784; and soon after a school (the first in Alaska) was organized for the children of the Russians. Also the first church building in Alaska was erected on this island. For a long time it was the Russian capital and the chief seat of their operations in America. A tombstone in the Russian cemetery bears the date of 1791.

The village has a pleasant look, and consists of 43 log-houses, 23 rough board houses, and 12 painted ones. It has a Russian Creole population of 303, of whom 143 are children. There are 20 white men in the settlement. The Russian school had been extinct for more than a quarter of a century, and for years the people had been looking for another. It was a great satisfaction to be permitted to give them a good school. Prof. W. E. Roscoe, an experienced teacher from California, with his wife and babe, was stationed at this place, and received from the people a very warm welcome. He had been landed but a few hours when a delegation of adults waited upon him and asked that a night school for instruction in English might be established for the married people.

Mr. Benjamin McIntyre, the efficient general agent of the Alaska Commercial Company, furnished a school-room free of rent and in many ways gave important help to the teacher. Valuable assistance was also received from Mr. Ivan Petroff, deputy collector of customs.

Opposite Kadiak is Wood Island, with 50 bright children. The patriarch of the village gathered them into a room and then made a touching appeal for a school. It was with a heavy heart that I said to them, as subsequently I was compelled to say to many others, "I would be glad to give you a school, but I can not." The meagre appropriation by Congress of \$15,000 for the education of the ten or twelve thousand children of Alaska necessarily deprives the majority of them of any school.

To the north of Wood Island is Spruce Island, where a Russian monk, at his own expense, kept up a school for thirty consecutive years. He died and his school was discontinued. To their entreaties for a school we had to turn a deaf ear. They are a well-to-do people, with humble but pleasant homes. They have a number of cows, make butter and cheese, and raise potatoes. The men are mostly hunters of the sea-otter.

Still farther north is Afognak Island, with 146 school children. A school was established among them, with Prof. James A. Wirth in charge. While superintending the unloading of the school supplies through the breakers we were invited by one of the villagers to a lunch of rice, fried chicken, potatoes, eggs, bread, and sweet fresh butter, cake, home-made preserves, and Russian tea served in glass tumblers.

From Afognak we visited Karluk, with its 118 children; Akhiok, 48; Ayakhatalik, 72; and Kagiak, 45. All of these groups of bright-eyed, rosy-cheeked, and healthy children had to be refused schools for want of funds. At some of these villages the ladies of our party were the first white women ever seen.

From the Kadiak group of islands, nine days' battling with the waves brought us to Unalashka, in Behring Sea. This is the commercial port of western Alaska and contains a population of 340, 132 of whom are minors under twenty-one years of age.

Mr. S. Mack, agent of the Alaska Commercial Company; Dr. Call, the company physician; Collector Barry, and Commissioner Johnston did all in their power to make our visit pleasant. At this village a school of 24 pupils was in operation under the control of the Russo-Greek Church. The teacher, Tsikoores, was born in Greece and partly educated in San Francisco.

The boys attend school in the forenoon and the girls in the afternoon. The instruction is mainly in the Russian language.

The public school maintained in 1885-86 had been discontinued.

The appropriation of Congress was made so late in the summer that there was no opportunity of communicating with the teacher.

He hearing nothing from the Bureau with reference to continuing another year took passage upon the revenue steamer, at the close of her summer cruise, and left the country. The desks and school supplies were removed to Unga.

The Greek Church has 16 general holidays and 200 minor ones during the year, which are celebrated more or less by the Alaskan churches. These numerous holidays prove a serious hindrance in securing regular attendance at school.

American citizens that have never heard a prayer for the President of the United States, or of the Fourth of July, or the name of the capital of the nation, are taught to pray for the Emperor of Russia, celebrate his birthday, and commemorate the victories of ancient Greece. Upon one occasion, trying to inform them that we had come from the seat of government at Washington to open the way for the establishment of schools, we found that the only American city they had ever heard of was San Francisco. After laboring with them, one man was found who had somehow heard of Chicago. Boston, New York, Philadelphia, and Washington were unknown regions.

In the mountains back of Unalashka a volcano was in active eruption.

Passing out of the beautiful harbor of Unalashka four days brought us by the magnifi-

cent smoking volcanoes of Shishaldin and Pavloff to Belkofsky, the centre of the sea-otter fur trade.

This place, with its white houses crowning a high bluff, presents a very pleasant appearance from the sea. It has a population of 203 Aleuts and Creoles, of whom 91 are under 21 years of age. The Greek Church keeps a small school with an attendance of 16 at the time of our visit. The teaching is in Russian, with the exception of two afternoons in the week, when a Creole teaches in broken English. We were importuned to establish a good Government school, but the appropriation was too small.

From thence we sailed to Unga, the centre of the cod fisheries of the North Pacific. Unga has the largest American population of any village in Western Alaska, and a greater appreciation of the value of a good school. It has 74 children under 21 years of age.

At this point I left Mr. and Mrs. John H. Carr to establish a school. On this trip a complete census was taken of the population from Kadiak westward to Attou, and in a total population of 3,840 I enumerated 1,649 children. These are children of a civilized people who, by the terms of Article III of the treaty of 1867 between Russia and the United States, are declared to be citizens, and are guaranteed all the "rights, advantages and immunities of citizens of the United States," and yet after nineteen years of total neglect the United States Government only gives them three teachers, and the American churches but one missionary.

At every station visited the agents and employés of the Alaska Commercial Company, without an exception, gave us their hearty co-operation and all the assistance in their power towards the establishment of their schools. At two of the stations they supplied the buildings necessary for the schools free of rent, and at all of them furnished the teachers with their household supplies on the same terms given their own agents. Without these facilities it would have been almost impossible to have established the schools in that section.

From Unga eight days' driving before the storm brought us to Klawak, one of the principal settlements on Prince of Wales Island. It was my purpose to establish a new school at this point, but finding that the salmon cannery and saw-mill had closed for the season and the larger number of the people left for their winter village, Tuxikan, with the full consent of the teacher, Prof. L. W. Currie, I took him and his family to Tuxikan and temporarily established the school at that point. In the spring, when the people returned to Klawak for work, the school was removed to that point, where it now is.

Bidding them God speed, four days bring us to Sitka, the capital of the Territory, with its two good day schools and flourishing industrial training school.

At Sitka, taking on board the Governor and his interpreter, we sailed to Killisnoo, where was landed lumber and materials for a new school building.

Calls were made and schools inspected at Hoonah, Juneau, Wrangell, and Tongass.

Mr. and Mrs. S. A. Saxman, with their furniture and school supplies, were removed from Loring to Tongass, and finally we dropped anchor at Seattle, Puget Sound, on the 15th of December, and the memorable voyage of the first load of school teachers for Alaska was at an end.

All the objects of the trip were secured.

CONDITION OF THE SCHOOLS.

St. Michael.—In pursuance of the plan of the United States Commissioner of Education to establish schools in at least a few of the leading centres of the Territory (as the amount appropriated was not sufficient to do more), correspondence was had with the Mission Board of the Protestant Episcopal Church with reference to the establishment of a public school in the valley of the Yukon River.

Owing to the impossibility of getting the necessary supplies into that region the first season, it was finally arranged that the school might temporarily be located at St. Michael, on the coast. Consequently on the 1st day of July, 1886, a contract for the establishment of such a school was entered into between the Hon. John Eaton, United States Commissioner of Education, and Dr. William S. Langford, Secretary of the Protestant Episcopal Mission Board.

Rev. Octavius Parker, of Oregon, was appointed teacher. From a correspondence between Dr. Langford and the Alaska Commercial Company, the former was led to believe that although houses were very scarce at St. Michael, yet they would be able to provide for the teacher.

Upon Mr. Parker's arrival at his destination he found, to his great disappointment, that although the agent of the company did everything in his power for him, even to sharing his own residence, yet the quarters were so contracted that it was with great discomfort that his own family could get along, and that there was no possible place for holding a school.

To add to his difficulties the priest of the Russo-Greek Church, who had previously been living in the Yukon Valley, removed to St. Michael and opened a school, teaching the natives in the Russian language. This church school, while doing next to nothing

for the children, yet through misrepresentation and prejudice kept them away from the Government school.

Professor Parker, however, taught a few from time to time in his own sitting-room.

He has now purchased a building at Anvik, on the Yukon River, where he will open a school next September with Rev. John W. Chapman as assistant. Although there are two teachers the Government pays but one salary.

This school met with a great loss last winter in the death of Mrs. McDowell, who had accompanied Professor Parker as an assistant.

Bethel.—At this point, 150 miles up the Kuskokwim River from Behring Sea, school was opened on the 8th of September with six pupils—four boys and two girls; of these, three boys were boarding pupils, living in the teacher's family. This number gradually increased until he had an attendance of thirteen. The migratory habits of the people after food, and the custom of the whole family accompanying the man and father, greatly interferes with the attendance on school. The few children who did attend were found to be willing and apt scholars, and made as good progress as could be expected in a strange language. The boys are taught and required to do their own washing, ironing, and cooking. As the children have never been accustomed to any restraint, the school hours have been broken up as much as possible. The school day consists of two hours in the forenoon, two in the afternoon, and one in the evening. Outside of these hours they cut and split wood, wash, iron, cook, and do chores. Good buildings were erected at the expense of the Moravian Church, and the foundations of an industrial training school are being wisely laid. During the last two years there has been a great scarcity of food in the valley of the Kuskokwim, which has interfered with school operations, but it is thought that a sufficient supply can be secured this season, which will enable the teacher to receive all the pupils that shall offer.

There are twenty-two regular villages on the river, with a population of 2,600.

On the coldest day last winter the thermometer recorded 44° below zero as over against 50° below during the winter of 1885-86. I regret to say that, owing to illness in his family and hemorrhages of the lungs himself, Professor Weinland has been compelled to leave the field and return to Pennsylvania.

The school will be carried on by Mr. and Mrs. John H. Killbuck, experienced teachers from Kansas. They have been in the work at that place for the past two years, and have made considerable progress in mastering the native language.

Nushagak.—During the summer of 1886, Rev. Frank E. Wolff, of Wisconsin, was sent out by the Moravian Church to erect a teacher's residence and school-house at Nushagak, at the mouth of the Nushagak River, Behring Sea. After the erection of the residence, he returned east for the winter. On the 12th of May last, accompanied by his family and Miss Mary Huber, he sailed from San Francisco to open a Government school at Nushagak. Miss Huber is a teacher from Pennsylvania, of large experience and great success, who resigned her position in a prominent ladies' seminary in order to enter the Alaska work. At this school, as at the others, the Government pays but one salary.

These three schools, 500 miles from each other, and central to a population of from 10,000 to 12,000 uncivilized natives, should by all means be sustained. They are the entering wedges to the civilization of that whole great region—the beginning of better things. And the trained men and cultivated women who are willing to exile themselves from the world, endure the rigors of an arctic climate, battle continuously with cruel superstitions and filthy customs, and work with a barbarous, degraded, and dirty people, in their zeal to educate, civilize, and lift up the child population and transform them into useful citizens, are worthy of full sympathy, hearty co-operation, and a generous support.

Unga.—This is the chief sea-port and village on the Shumagin Islands. School opened on the first day of November, 1886, with Professor and Mrs. John H. Carr, of Washington Territory, teachers.

The only place that could be obtained for the school was a small and uncomfortable room 22 by 9½ feet. Into this the children were crowded so closely that they could not leave their seats for recitation. A commodious school-house is a pressing necessity. The progress of the pupils has been as gratifying as it was unexpected. Towards the close of the school year the Russo-Greek Church established a school in this village and sought to draw the children away from the Government school, but without success.

The Russian school, like the majority of their schools in Alaska, is mainly taught in the Russian language, and the studies are largely on the liturgy and catechism of the church. This school met with a great loss in the death of Mrs. Carr on the 15th of June. By her sweet disposition, as well as skill in teaching, she had secured the affections of her pupils to an unusual degree.

Kodiak.—This school was kept in a cooper shop, which was fitted up and kindly tendered to the Government by the Alaska Commercial Company. While it was a generous act on the part of the company, for which the Bureau of Education should render it thanks, yet it is not to the credit of a great Government that it must be dependent on private parties for buildings in which to hold its schools.

A good substantial school building is greatly needed at Kadiak.

The pupils manifested a great fondness for and excelled in writing and drawing, but with a few exceptions were dull in arithmetic. In addition to the ordinary day school Professor Roscoe held an evening school for working men who could not attend during the day, and Mrs. Roscoe an afternoon school for married women.

Strenuous efforts were made upon the part of some to discourage the attendance of the children, and a strong prejudice manifested itself against the children being taught English. But notwithstanding the opposition 59 pupils were enrolled during the year.

Over against these discouragements there were some encouraging examples of unusual eagerness to secure the advantages of a good school.

One family, over 80 miles away by sea, reading in a stray copy of a San Francisco paper that a public school was to be established at Kadiak, broke up housekeeping and the mother and two grown daughters moved to Kadiak to attend school, reaching there six months in advance of the teacher.

Another family, consisting of a mother and five children, on their way to school were shipwrecked and lost. There is no doubt that there are many families ready to make great personal sacrifices to secure educational advantages.

Professor Roscoe has made good progress in learning the Russian language, spoken by the pupils of his school. As he becomes more and more proficient in it he will be more and more successful in teaching English.

Afognak.—This school has met the usual difficulties encountered in all the schools among the Aleut and Creole population. The people in language, and still more in sympathy and feeling, are Russian. They are taught in some cases to believe that the American occupation is but temporary and that Russia will again come into possession. Many of them look upon the Americans as barbarians and do not wish their children to learn English. In some cases an effort has been made to frighten those who manifested some interest by telling them that as soon as their boys learned English the Government would draft them into the army and carry them off, no one knew where.

The school at Afognak had the further difficulty that there was no interpreter to be had, as at Kadiak and Unga, or any children of American fathers, as a nucleus for the school. Neither parents nor children have any idea of the necessity of application or the importance of the advantages offered them by the school. Then, the building used for the school (the only one suitable that could be rented in the community) was too far one side to accommodate the people. Notwithstanding these and other hindrances, a good school was maintained and the children that attended with any degree of regularity made good progress. They excel in music, writing, and drawing.

The murder of Mr. B. G. McIntyre, the general agent of the Alaska Commercial Company at Kadiak, was a great blow to the school. He had great influence among the people of the islands and had actively interested himself in behalf of the schools.

Prof. James A. Wirth, who has natural gifts in acquiring language, being able to speak several European tongues, is making rapid progress in learning the Russian, which is the language of his district.

The private building occupied by the school is inconvenient and unsuited for the purpose and a comfortable building should be erected at once in a central location.

Chitcheet.—Owing to the infrequency of communication (this school being 100 miles from a post office) it was not for some weeks after school should have commenced that I received the resignation of Miss Sarah M. Dickinson as teacher and it was several weeks after her successor was appointed before he could reach the place.

The school was opened in January by Mr. Salomon Ripinsky with a good attendance. The average continued large until April, when the parents, hiring as packers to the miners going into the interior, took their children away with them.

This greatly diminished the attendance during the spring months.

Through the courtesy of Rev. Eugene S. Willard, in charge of the Presbyterian mission, a good building, desks, etc., were furnished the school free.

Juneau.—Dr. F. F. White, in taking charge of this important school at the commencement of the school year, at once proceeded to systematize and grade it.

The school opened with a good attendance of American and Creole children, the natives being largely away from home preparing their winter supply of food. But as the natives returned to their homes the attendance of their children steadily increased through the winter until spring, when they were off again for food. As the attendance of the native children increased that of the Americans and Creoles fell off. It was the old story of mixed schools. The appropriation allowed of but one teacher, and consequently there could be but the one school. In 1885 and 1886 the attendance was largely Creole; in 1886 and 1887 it was largely native.

The advanced classes finished their geography and made satisfactory progress in United States history, physiology and hygiene, and arithmetic, both mental and practical.

It was a notable fact that the first and second chiefs of the Auke tribe were at times daily attendants, and their children among the most regular of the pupils.

Juneau, being the largest and most important settlement in Alaska, should have a good, substantial school building and separate schools for the whites and natives.

Killisnoo.—This school has had to contend in common with the others with irregular attendance.

Professor Johnston speaks approvingly of the eagerness to learn manifested by the Creole pupils.

At the commencement of the school year lumber and material were procured to erect the much needed school-house, but a difficulty arising with regard to the location the erection of the building was delayed until this summer. This is the first school building erected by the Government in Alaska.

Sitka.—The two Government schools at the capital of the Territory are housed in buildings that a thrifty farmer would not consider comfortable enough for his cattle. They also have to contend with irregularity of attendance, especially in the school for natives.

Miss Powell reports the rapid advancement of the Creole pupils and the gratifying progress they are making in learning the English language.

If suitable buildings can be erected this coming fall the usefulness of these schools will be greatly increased.

Fort Wrangell.—This eldest of the schools in southeastern Alaska has had a most successful year.

The school year opened with 45 pupils and steadily increased to 112. It can well be called the polyglot school. Among the pupils were representatives of 13 tribes, Americans, and the following half bloods: French and Stickine, Irish and Stickine, American and Stickine, American and Russian Creole, American and Alaskan Creole, American and Hydah, Scotch and Hanegah, and Norwegian and Taltan.

With regard to the intellectual capacity of the full and half bloods, Miss McAvoy reports that while the half bloods learn more easily, the full bloods master their studies more thoroughly. That while the half bloods are more nimble of brain, the full bloods have quite as much of it. And that the full bloods learn to speak better English than the half bloods. She also reports the great interest her children have taken in the Child's Health Primer and the hygiene for young people.

The school has been kept in a room in the old hospital. The roof leaks, the water pours in around the windows, and the floor of the front porch has rotted away, and partly fallen in. If the school is to be kept in the same place another season the building should be extensively repaired.

Klawak.—This is a new station, the school being established for the first time last winter. The school was first commenced at Tuxikan, where, with commendable heroism, Mr. and Mrs. Currie had volunteered to go. As no white man had ever resided in the village there was no suitable dwelling to be had, and the teacher was compelled to occupy a portion of one of the native houses. This was a plank building about thirty-seven feet square with a rotten bark roof. Through the cracks of the plank floor the surf could be seen at high-tide dashing under the building. The house was constructed after the native fashion, all in one room. Entering the door, steps led down two feet to a plank platform seven and one-half feet wide, which extended around the four sides of the room. From the platform steps descended three feet to the lower floor, which formed a pit twenty-one by twenty-two feet in extent.

In the centre of this pit a space eight feet square had been left unplanked. This was the fire-place. In the roof directly over the fire-place a similar opening had been left for the escape of so much of the smoke as had not previously escaped through the cracks of the sides of the building. Through this same hole in the roof the rain descended in sufficient quantities to put out the fire.

On the platform opposite the door was a small room fifteen and a half by six and a half feet used as a bed and store room. The hole in the roof was roughly boarded up, and a large box stove placed in the pit, which became the school room.

Posts were erected at each corner of the pit, and sheeting stretched across, curtaining off the platforms on two sides of the building. These platforms thus curtained off became the residence of the teacher. The native with his family of six occupied the other two platforms.

Into this dilapidated and uncomfortable building this cultured family, in their zeal to lift up this poor people, moved without a murmur.

In the spring Mr. Currie, with his family, removed to Klawak, renting the only building to be had, an unfinished board shanty erected out of refuse lumber.

Notwithstanding all these discomforts and hindrances he had a very large school, his total enrolment for the whole year being 184. The best work, however, can not be expected until the teacher has a comfortable building in which to house his school.

Howkan.—This school has continued to send in its good monthly reports.

The temporary shanty which for several years past has been used for the school during a heavy snow storm last winter was crushed, and now the school is shelterless.

In some respects the Hydah are considered the best people on the North Pacific Coast, and immediate steps should be taken to erect a school-house suitable for this important Hydah centre.

Tongass.—In southeastern Alaska are the three small villages of Port Tongass, Cape Fox, and Scowls, neither of them with a population sufficient to justify the expense of a school, and yet, if united, would form the constituency of a good school.

To secure such a school the leading men of the three villages have agreed to leave their old settlements and together build a new one.

In the hope that the united village would be located at Loring, Prof. S. A. Saxman, of western Pennsylvania, was sent to that place.

Finding but very few people there (work for the season having closed at the salmon cannery), it was thought advisable that for the winter at least he should teach the school at Tongass.

During the Christmas holidays Professor Saxman, accompanied by Mr. Louis Paul, a native missionary, and another native, started to visit Port Chester, a place that had been mentioned as a suitable location for the new village. The party was lost at sea. When they did not return two search parties were sent out, who found the canoe broken on the rocks. The bodies of the men were never recovered. This sad event closed the school.

It is now more than probable that Port Chester will be settled this summer by a colony of Christianized and civilized natives from Metlakahla led by Mr. William Duncan. If this proves to be the case, it will make a centre around which the scattered population can cluster and secure good school facilities.

The above schools furnish the following statistics:

CHURCH AND PRIVATE SCHOOLS.

In addition to the above, schools have been in operation on each of the seal islands, St. Paul and St. George, supported by the Alaska Commercial Company. The Russo-Greek Church has had small schools at Unalashka, Belkofsky, Kadiak, and Sitka. * * *

At Juneau there has been a school under the auspices of the Roman Catholic Church, and at Sitka an industrial training school under the control of the Presbyterian Board of Home Missions, assisted by the Indian Bureau.

Although applied for, I have failed to receive the statistics of the Russian and Roman Catholic schools.

The Sitka Industrial Training School, with its large and commodious buildings and teaching force of 13 persons, is the best equipped school in the Territory.

The two principal industries at present taught the boys are carpentering and blacksmithing. The institution is also furnished with tools for boot and shoe making, and a press and complete outfit for a printing office.

During the present summer the Elliott F. Shepard Industrial Building has been erected, furnishing accommodations for the carpenter shop, wood-carving, boot and shoe room, and printing office. A hospital building has also been erected in connection with the school.

Mr. Edwin Hale Abbott, of Milwaukee, has generously offered to found a department of wood-carving and weaving, in which the native population excel.

The attendance has averaged 100.

As the boys and girls are clothed, fed, lodged, and taught at the institution, they are continuously under the influence of the teachers, and the best results are secured.

The school is under the management of Prof. William A. Kelly, assisted by Rev. Alonzo E. Austin, chaplain; Mrs. A. E. Austin, matron of the Boys' Home; Miss A. R. Kelsey, matron of the Girls' Home; Miss Ida M. Rogers, teacher in the school-room; Mrs. Susan S. Winans, teacher in sewing room; Miss Virginia M. Pakle, teacher in the laundry; Mrs. Charles E. Overend, teacher in the kitchen; Mr. C. E. Overend, teacher in the carpenter shop; and Mr. Joel Liberty, teacher in the blacksmith shop.

* * * * *

During my trip last fall along the coast of southern Alaska to Behring Sea, I procured a complete census of the Aleut, Eskimau, and Creole population from Kadiak to the end of the Aleutian Islands.

Last winter the teachers of southeastern Alaska took a census of their respective villages. These statistics are embodied in the following table with those taken by myself during my trip of last fall to the Aleutian Islands:

Name of village.	Adults.		Minors under 21.		Total adults.	Total children.	Total population.
	Men.	Women.	Boys.	Girls.

No official course of study has been marked out for the various schools. The experience of the two years during which public schools have been in operation, and the experience of the mission schools for nearly twelve years, have demonstrated the fact that it would not be wise to hamper the teachers with a course of study that would not fit the surroundings of the school. Attendance is so irregular, the pupils of such different ages (from 6 to 60), with such varying aptitudes for acquiring the English language, and all ages in the primary grades, that a uniform plan would be impossible. It must be left necessarily to the tact and originality of the teacher.

COMPULSORY ATTENDANCE.

The reports of the several teachers during the year are burdened with complaints of irregular attendance and of their inability to secure the best results from their teaching because of this irregularity. The new board of education has taken this matter in hand, and it is hoped that something may be accomplished next year in securing a more regular attendance of the pupils.

The appropriation of Congress for the education of children in Alaska, without distinction of race, was only \$15,000.

If the schools had been dependent upon that alone, either one-half of them would have had to be closed, or all of them closed up at the end of six months. Fortunately there was an unexpected balance of 1884 which was available. The aggregate expense of running the schools the past year has been \$25,000. In the appropriation for 1887 and 1888 the sum of \$25,000 has been granted. As it is very essential that the number of schools should be increased and buildings erected at the more important points, I would urgently recommend that the appropriation for 1888 and 1889 be increased to \$50,000.

Every publication which helps to make Alaska known to the outside world, either directly or indirectly, helps the school work.

Among the popular works on Alaska published in recent years are the following:

Life in Alaska. By Mrs. Eugene S. Willard. Illustrated. Philadelphia: Presbyterian Board of Publication, 1334 Chestnut Street. Pp. 384. Price \$1.25.

Among the Alaskans. By Mrs. Julia McNair Wright. Illustrated. Philadelphia: Presbyterian Board of Publication. Pp. 351. Price \$1.25.

* * * * *

I would recommend the following additions to and modifications of the school laws:

1st. That as the new rules and regulations look to obligatory school attendance, the board of education be authorized to employ a special policeman to enforce attendance at each settlement where a public school exists and at which there is no other policeman to perform the duty; said policeman to be paid from the educational fund.

2d. That the supervision of the schools of the Territory be divided into the eastern and western division.

The eastern division shall comprise southeastern Alaska and the western division the remainder of the Territory.

That a superintendent of public instruction be appointed by the United States Commissioner of Education for each of these divisions.

That the superintendent of the eastern division shall have his headquarters at Sitka, and be *ex officio* secretary of the board of education.

That the superintendent of the western division shall have his office at the Bureau of Education, Washington, and spend that portion of the year in which vessels are plying between the different ports of western Alaska in visiting the schools in his district.

This division of the superintendence is rendered necessary—

(a) Because there is no means of transportation between eastern and western Alaska. The one section is reached by sea from Puget Sound, and the other section by sea from San Francisco. This is such a barrier to jurisdiction, that although the civil government has been in existence over three years, not one of the civil officials has been able to visit any portion of the Territory outside of southeastern Alaska, except the general agent of education, and he only succeeded by chartering a special vessel. There have been several murders in southwestern Alaska, but the guilty parties are at large because the court has no means of reaching them.

(b) This division is rendered necessary by section 4 of rules and regulations, which directs that the general agent "shall visit each school district and each school in the district at least once a year."

This is a physical impossibility. With the present means of communication no one person can visit each school in the Territory once during the same year. If he gives his attention to the schools in southeastern Alaska he can not reach those in western Alaska the same season. And *vice versa*, if he attempts to visit the schools in western Alaska it will keep him away from southeastern Alaska the entire season. In the forming state of the schools it is important that a yearly visit should be made, but this can only be accomplished by a subdivision.

3d. I would again renew my recommendation that the Honorable Secretary of the Interior be requested to ask Congress for \$50,000 for the school fund for the year ending June 30, 1889.

4th. I would further recommend that the annual reports of the several teachers, the special report of Miss Alice C. Fletcher to the Honorable Secretary of the Interior on the need of schools in western Alaska, and the proceedings of the Territorial board of education be printed in the appendix to this report.

5th. I would still further recommend that legislation be asked from Congress setting apart one-fourth of the gross revenues of Alaska annually as a fund for the education of the children of Alaska without distinction of race.

In the Western States and Territories Congress has granted sections 16 and 36 in each township for the use of the schools in said States and Territories.

In Alaska the lands are unsurveyed, and when in course of time the general land laws are extended over it, the nature of the country and the requirements of the population will prevent the laying out of the land to any great extent in sections of a mile square.

While no school fund is practicable for years from the lands, the General Government derives a regular revenue from the Seal Islands, a portion of which can be used in the place of the proceeds of the sale of the school lands.

The present method of supporting the schools by an annual appropriation prevents the feeling of permanence. A failure on the part of Congress any one year to make provision for the support of the schools will close them up, causing a loss of public property and a serious drawback to the success of the schools.

Very truly, yours,

SHELDON JACKSON,
United States General Agent of Education in Alaska.

ARIZONA.

[From Report of Governor C. M. Zulick, 1887.]

PUBLIC SCHOOL SYSTEM.

The public school system of Arizona is a subject of pride to all of her citizens. School advantages are freely offered to every child in every part of the Territory. Paying higher salaries than any State or other Territory, it also requires a higher standard of ability in the teacher. The public schools are supervised by a Territorial superintendent of public instruction, who is elected biennially. There is also a Territorial board of education, consisting of the superintendent of public instruction, Territorial treasurer, and the Governor, whose duty is to adopt rules and regulations for the government of the public schools and libraries, devise plans for the increase and management of the Territorial school fund, prescribe and enforce the use of uniform series of text-books and course of studies, grant educational diplomas, and revoke for immoral conduct or evident unfitness for teaching Territorial diplomas. The probate judge of each county in the Territory is made *ex officio* county superintendent of the public schools for his county. His duty is to apportion the school moneys to each district of his county, to draw the necessary warrants on the county treasurer for expenses against the school fund, enforce the course of study, the use of text-books, and the rules and regulations for the examinations of teachers as prescribed by the proper authority. The Territory is divided into school districts, which are presided over by three school trustees, who are elected at a special election, and whose duties are to generally superintend all school matters within their district. The public schools of the Territory are maintained by the levy of a tax of 3 cents upon each \$100 value taxable property, collected and paid into the Territorial treasury as a special fund for school purposes, and then apportioned to the respective counties. The school year begins on the 1st day of July and ends on the last day of June. The Territory has also in successful operation a normal school, located at Tempe, Maricopa County, and has endowed a university at Tucson, Pima County, which is not yet constructed.

All moneys accruing to the Territory by the sale of personal or real property of an escheated estate, or from the rents or profits of lands or tenements held as escheated, are payable into the school fund, as also all moneys arising from fines, forfeitures, and gambling licenses.

By her liberal and progressive system of public schools Arizona is diffusing knowledge among her rising generation and preparing her youths to intelligently assume the duties of American citizenship when clothed with its cares and responsibilities.

SCHOOL LANDS.

By act of Congress there have been seventy-two sections of public lands within the Territory granted for the purposes of a university, also the sixteenth and thirty-sixth sections of every township for a school fund. The Territory is deprived of the use of these lands until it becomes a State. If the sixteenth and thirty-sixth sections in every township could be sold and the money arising from the same appropriated to defraying the school expenses of the Territory, it would prove a great benefit to the cause of education and greatly relieve our overburdened tax-payers. Arizona needs the benefits to accrue from these lands now more than when she becomes a State, and should enjoy the privilege of their disposal the same as is granted the States. Not having any control over these lands they are fast being denuded of timber, so that when we do enter statehood and control them they may practically prove valueless. Again, many of these sections are being occupied by settlers who innocently and from want of information are wasting time, labor, and money in clearing the land, erecting buildings, and making improvements which will in the future prove a total loss to them.

I respectfully recommend that Congress be asked to give the Territories the same privileges as the States now enjoy in this matter and authorize the absolute transfer of these lands to the respective Territories for the immediate benefit of the cause of public education.

ARKANSAS.

For the statistical and other information in the possession of the Bureau relating to education in Arkansas consult the Index.

CALIFORNIA.

NEW LEGISLATION.

State text-books.—In addition to the books heretofore directed, the State board of education shall compile or cause to be compiled an elementary arithmetic, an elementary grammar or language lessons, an elementary geography, and a physiology and hygiene, including a system of gymnastics and instruction as to the nature and effects of alcoholic drinks and narcotics.

All orders for text-books shall be made upon the superintendent of public instruction, and shall be accompanied by cash at the price fixed as the cost price at Sacramento. The following persons are entitled to order: (1) County superintendents of schools, (2) principals of State normal schools, (3) secretaries and clerks of school districts, (4) retail dealers who make affidavits not to sell any books of the State series at a price to pupils exceeding that fixed for them.

All State text-books shall be furnished to pupils at the cost of printing, publishing, and postage.

For other information relating to education in California consult the Index.

COLORADO.

NEW LEGISLATION.

State superintendent to construe laws.—The State superintendent is to decide all points touching the construction of the school laws, and his decision shall be held to be correct and final until set aside by a court of competent jurisdiction or subsequent legislation.

School year.—The beginning of the school year has been changed from September 1 to July 1.

Maps of counties.—Each county superintendent is required to have prepared a map of his county, showing the correct boundaries of the district.

Penalty of failure to make reports.—Whenever any district shall fail to make the annual report required by law, or to maintain a school for one year, or keep up its organization of officers, the county superintendent may declare such district annulled, and annex its territory to adjoining districts.

Term of school directors.—One school director is to be elected annually, to serve for five years, instead of two for three years, as heretofore.

Qualification of voters in the matter of contracting a school debt.—At all elections held for voting upon a proposition to create or contract a debt by loan for the purpose of erecting or furnishing school buildings, or purchasing school grounds, only such qualified electors of the district shall vote thereat as shall have paid a school tax in such district in the year next preceding such election.

Free text-books.—District school boards are required to furnish free text-books for the use of all pupils when authorized to do so by a majority vote of the district as expressed at any regular or special meeting.

Expurgation of school libraries.—School boards are directed to exclude from school and school libraries all books, tracts, papers, and other publications of an immoral or pernicious tendency.

Library tax.—The board of any district may order the levy of not to exceed one-tenth of 1 mill, the proceeds of which shall be used exclusively in the purchase of books for a library, to be open to the public under such rules as the district board may deem needful for the proper care of the said library.

Forfeiture of school funds.—Any school district failing to maintain a public school at least three months of any school year shall not be entitled to receive any portion of the school fund for that year.

Schools taught in the German and Spanish languages.—Whenever the parents or guardians of twenty or more children of school age of a district shall so demand, the district board may procure efficient instructors to teach the branches required by law in the German and Spanish languages, or in either.

Temperance instruction.—SEC. 1. The nature of alcoholic drinks and narcotics, and special instructions as to their effects upon the human system, in connection with the several divisions of the subject of physiology and hygiene, shall be included in the branches of study taught in the public schools of the State, and shall be studied and taught as thoroughly and in the same manner as other like required branches are in said schools by the use of text-books, designated by the board of directors of the respective school districts, in the hands of pupils where other branches are thus studied in said schools, and by all pupils in all said schools throughout the State.

SEC. 2. It shall be the duty of the proper officers in control of any school, described in the foregoing section, to enforce the provisions of this act; and any such officer, school

director, committee, superintendent, or teacher, who shall refuse, fail, or neglect to comply with the requirements of this act, or shall neglect, refuse, or fail to make proper provisions for the instruction required, and in the manner specified by the first section of this act, for all pupils in each and every school under his or her jurisdiction, shall be removed from office, and the vacancy filled as in other cases.

Rents of school lands.—The law requiring rents of school lands to be applied to the increase of the permanent school fund has been repealed.

For other information relating to education in Colorado consult the Index.

CONNECTICUT.

[From Report of Board of Education for 1886-87—Charles D. Hine, Secretary.]

ENUMERATION AND ATTENDANCE.

Of the 153,260 children enumerated as between four and sixteen years of age, 126,426 were reported as having attended school. This attendance may have been for one day or a few days only. It includes those who attended private as well as public schools, but does not include any over sixteen years of age.

Of the whole number enumerated, 26,834 are reported as having attended no school.

Of these non-attendants, 10,203 were reported to be under five, and 8,891 were between five and eight years of age. Thus 19,094 were either too young to attend or were below the compulsory limit; 5,556 were reported to be over fourteen and had passed the compulsory limit.

We have left 2,184 non-attendants between eight and fourteen, the limit of compulsory attendance. This is larger than last year by 268.

Causes of falling off in attendance.—In 1879, 86 out of every 100 children enumerated were enrolled in public schools, and 53 out of every 100 enumerated were in regular attendance. In 1887, 82 and 49 out of every 100 were enrolled and in attendance respectively. The fact which deserves attention is that a decreasing proportion of the persons enumerated attend school.

Among the causes of this falling off are:

1. The large towns exclude all children under five, and everywhere there is little disposition to send very young children.

2. The limit of sixty days has become in many places the standard, and instead of long periods of attendance there have been long periods of work with intervals of school.

The law prohibiting employment of children under thirteen would naturally increase the number in attendance; but so many advanced with a bound from eleven or twelve to fourteen that in few schools has any increase from this cause been noted. The difficulties encountered in ascertaining the ages of children, whether by reference to town or school records, are very great. Without doubt many children under thirteen are to-day escaping the provisions of the law relating to employment and attendance through false statements of parents.

Effect of private schools upon attendance.—The average attendance in all the schools was 853 less than last year.

This contraction is in part explained by the opening in several large towns of private schools. This special cause can not long operate, because the number which can be withdrawn from public to private schools is limited, and the limit will soon be reached. Moreover, private schools can not exist in competition with public schools as long as the latter maintain a clear superiority. This superiority has thus far been easily maintained, and no considerable number of people can be enticed or compelled to diminish the privileges of their children. So long as the best education is found in public schools these schools will attract the great body of children.

Connecticut leads in the matter of compulsory attendance.—The law which requires all children under thirteen years of age to attend 120 days in each year places this State in the lead in respect of compulsory attendance. In districts where school is open not longer than six months in the year conformity to the law will permit no absence not guarded by the recognized legal excuses.

The law now regards each week's absence a distinct offence on the part of the parent, who may be proceeded against at once, and also permits the State board of education more actively to engage in enforcing attendance.

EMPLOYMENT OF CHILDREN.

The record of active work by the agents for the enforcement of the Child-Labor Act of 1886 is summarized for the year as follows:

Number of towns visited.....	150
Number of establishments specially inspected	401
Number of establishments visited	2,149
Number of children under thirteen found.....	83
Number of children reported as discharged	1,173

Few cases of violation of the law have been discovered. These cases range all the way from pure accident to careless and illegal negligence.

The law is plain and simple and easy of administration. None of the evils which were apprehended from its passage have resulted. Business has not been affected; no appreciable number of families have left the State; idleness has not increased; vagabondage is not prevalent, and cases of hardships have not been numerous.

There is no evidence that attendance at school has sensibly increased in consequence of the discharge of 1,173 children from employment. The rapacity of parents has impelled them to false statements concerning the ages of their children. The reports indicate extensive, deliberate, and unqualified lying for the sole purpose of securing the money which their children can earn. It is difficult and generally impossible to fix this falsification by evidence admissible in court. The result is that children are employed who ought not to be employed, and are out of school when they ought to be in school.

Employés have generally yielded cheerful obedience to the law, assisted in its execution, and approved its form and principle. The exceptions are so few that they are conspicuous. Deliberate and intentional evasion and deception have been found in one case only.

TEACHERS.

Sex of teachers.—The secretary gives a tabular summary of the statistics of teachers since 1866, from which the following conclusions are drawn:

In the winter of 1865, 31 in every 100, and in summer, 5 in every 100 teachers were men; in 1887, in winter 13, and in summer 11, in every 100 were men. The number of teachers increased about one-third.

In the same period the number of female teachers employed in winter increased 1,111, while the number of male teachers decreased 122. The number of male teachers employed in summer is larger by 230, and the number of female teachers in summer by 771. The number of male teachers in summer shows accurately the number of male teachers continuously employed. It is evident that, so far as permanent situations are concerned, men are not giving place to women; while more and more districts that formerly alternated in winter and summer employ women for the whole year. Moreover, women have entirely superseded men in primary and most grammar schools, leaving open to men only a small number of grammar schools, an insignificant number of high school positions, and substantially all the positions requiring supervisory duties. In ungraded schools few men are employed, either in summer or winter.

Number continuously employed.—The number continuously employed has more than doubled, and the number of beginners shows a steady decrease.

Wages of teachers.—The wages of men show fluctuations from year to year, being affected by the addition or subtraction of two or three large salaries to the small aggregate.

The average wages of women have increased, but not very rapidly or largely. There are still about 900 female teachers whose salaries are \$30 a month or less, and of these 500 receive \$25 or less. This sum is received for six to nine months' service, in most cases for not more than eight months. In fine, 900 teachers receive less than \$240 per year, and out of this all expenses must be paid. It will be profitable to those who accept poor teachers and regard poor schools as a necessity to consider the effect of such meagre salaries. There is no encouragement for preparation nor for continuance in the business. There is no chance for a decent living, nor any stimulus, except that of duty, to thoroughness or improvement.

SCHOOLS.

Number of days of session.—There has been a steady advance in the number of days schools are in session. The average for the State is now 180 days, or 9 months in the year. In many towns schools are open 10 months or 40 weeks, and a majority of the children of the State can attend for this longer period. In too many districts there are but 120 days or 6 months in the school year, and children can not and do not make a steady progress.

SCHOOL-HOUSES AND SCHOOL LIBRARIES.

School accommodations.—The number of school-houses built since 1865 is 618, which is more than one-third of the whole number now standing.

While the number of school-houses reported is the same for 1867 as for 1888, there have in 20 years been great changes. New buildings are constantly demanded and erected in cities and large towns, while in declining towns school-houses have been entirely abandoned.

Often two or more contiguous districts have united and occupy one school-house instead of the two or more formerly required.

The number of sittings is greater than the number of scholars who enter the public schools. It can not be said, however, that there are ample accommodations for all children. There are towns and districts where little children are wasting their time,

because too many are crowded into one room. Not more than 40 children can be seated and instructed in one room, if due regard is paid to health and efficient teaching.

Especially do young children form bad habits and fail in the special work of early years, if they can not receive adequate attention.

School libraries.—In the last few years the interest in libraries and books for schools has greatly increased. The number of school libraries has increased in 4 years from 219 to 322. The number of districts drawing money, from 195 to 287, and the amount drawn, from \$3,025 to \$5,000, the limit of the State appropriation.

There were more applications at the close of the last fiscal year than could be paid out of the appropriation for the year.

These libraries have everywhere been of advantage to the schools. They have stimulated the scholars and aided the teachers. There is need of legislation which will make the benefits received from this library money permanent. There are many districts which have in years past drawn this money from the State and to-day have not a remnant of a book or of any apparatus. There are well-known cases of misappropriation, while the cases of neglect and loss because of changing offices are very numerous.

The gratifying advances shown in the matters of buildings and libraries is not universal. There are still poor school-houses and 300 districts which have never drawn library money. The following statement, verified by personal inspection, describes a school-house in a district which will neither repair nor build: "The appearance of the inside of the room is bad. The floor is dirty, the desks cut and unpainted, some of the seats broken so that they are hardly 6 inches wide, most of the plastering is off the walls and ceiling, and the windows are loose and dirty. The outhouse was in an awful condition. * * * The door was off its hinges, and the building faced the road."

PERMANENT SCHOOL FUNDS.

The town deposit fund.—An illustration of the result of unconditional gratuities to education.—The amount of fund as reported for 1887 was \$753,326.87:

Invested in town securities (orders, bonds, etc.)	\$528,593.88
Notes and mortgages	144,862.13
Bank stock	21,184.51
Savings banks	29,135.48
Railroad and water bonds	10,400.00
In State treasury	17,328.48
Cash in hands of treasurers	1,822.39

753,326.87

In the amount (\$528,593.88) reported as invested in town securities is included a large sum upon which towns do not make any pretence of paying interest; other considerable sums which the town officers never heard of; other sums invested in town farms, public buildings, etc. The reports from officers charged with the care and legal application of this fund unmistakably indicate that not a dollar¹ thus invested in any sense promotes education in the common schools, as the condition of the trust requires. It follows that this large trust fund given upon plain conditions has been to the extent of these town orders and bonds entirely estranged, if not illegally diverted, from its original purpose.

Of the notes secured by mortgage, a large part not accurately ascertained are worthless. A few towns hold some unproductive real estate taken on foreclosure.

In fine, five-sevenths of this fund devoted by the State and received in trust by the towns, if not dead, is in a profound and very unhealthy sleep.

The interest is not a substantial sum of money which can be devoted to schools, but a fiction, legal or illegal, which appears on the books or not, as the town desires.

Local funds.—The amount of interest on local funds is reported to be \$7,723.20. While no investigation has been made, it is probable that these funds have been absorbed and have practically disappeared in the same manner as the town deposit fund, that this showing of interest is merely a method of book-keeping, and that there accrues therefrom no real addition to the amount appropriated to public schools.

TEMPERANCE INSTRUCTION.

Text book on physiology.—The text book of physiology and hygiene, with whose preparation the board of education was charged in 1886, was, after numerous and somewhat troublesome delays, issued in September last.

It was at first intended that the book should consist of two parts, one for the teacher and the other for the scholar. This was, for the present at least, abandoned, and the work was issued in a duodecimo cloth cover of 53 pages, with a series of charts for each school using the book.

¹A considerable sum, perhaps \$20,000, is held by town officers, a waiting investment. This, when invested, would be really productive.

In reference to the purpose of the book, one view regards the law as mainly requiring the teaching of "the effects of alcoholic liquors, stimulants, and narcotics on the human system." If this is correct, there should only be enough physiology and hygiene in the book to furnish a peg on which to hang such teaching. Precisely this idea obtains in some quarters and finds public expression. Another view regards the law as requiring primarily the teaching of physiology and hygiene, but with the effects of alcoholic liquors, etc., more fully dwelt on than in the usual text-books for the teaching of that study. This view was entertained by the board in the belief that it was correct and that it expressed the intention of the General Assembly, which during its deliberations on the subject struck the word "evil" from the bill, which originally provided for teaching concerning "the evil effects of stimulants and narcotics." It was the purpose of the board to follow faithfully the law in the preparation of the book (which duty was far from the desires of the members of the board) and to the best ability to set forth only the truth.

The call for books has been voluntary on the part of school officers. Thus far the board has not prescribed its book to the exclusion of any other. It is a noteworthy and gratifying fact that without such prescription the books have gone into all the towns and independent districts except six. This general distribution of the book is due largely to the fact that it costs nothing; but it is presumed that if the book were a bad one it would not be accepted.

It is too early to pronounce a confident opinion upon the experiment. Some like the book and some do not. So far as can be learned, and the investigation has been impartial, those who like it are more than those who do not. It is not in purpose, nor in methods suggested, an ordinary text-book, but many who are interested in good teaching approve its plan.

TOWN MANAGEMENT.

A bill was introduced at the last session of the General Assembly providing for the control by every town of the schools within its limits.

ARBOR DAY.

In 1886 the State Legislature passed an act directing the Governor to designate annually an Arbor Day to be observed in the schools, and for economic tree planting. April 29, 1887, was so designated. Returns have been received from 412 out of 1,424 school districts in the State, showing that on that day 3,432 trees and 727 shrubs were planted.

NEW LEGISLATION.

Child labor.—The agents appointed by the State board of education under the act of 1886 (which forbids the employment of children under 13 years of age) are authorized to enforce the provisions of the law as they may be directed by the State board.

Right of women to hold office.—No person shall be deemed ineligible to serve as a member of any board of education, school visitor, or school committee by reason of sex.

Compulsory attendance.—Children under 13 years of age who have attended school 24 weeks of the preceding 12 months, and children between 13 and 14 who have attended school 12 weeks within the preceding 12 months, and children over 14 years of age shall not be required to attend school during all the school year, provided they are lawfully employed to labor at home or elsewhere.

Any parent who fails to have his children attend school regularly during the entire school year, except when they are excused as above, and except when the child is destitute of suitable clothing, or is mentally or physically unfit to receive instruction, shall be subject to a penalty of \$5 for each week's failure.

Attendance at private schools shall not be regarded as compliance with the provisions of the law requiring attendance at school unless the person in charge of such school shall make reports to the State board of education similar in form to those required from the public schools.¹

For other information concerning education in Connecticut consult the Index.

DAKOTA.

[From Report of Superintendent E. A. Dye, 1886-87.]

"Dakota has passed the time of phenomenal growth, as shown in a more numerous population and increasing number of school-houses and an enlarged taxation for the support of the schools. She must now be content with a slower growth than has characterized

¹ "It has been difficult for many years to obtain full statistics of private schools, and the method adopted in this statute, while perhaps displeasing to many, is yet one brought about by necessity, in order that the authorities may get more accurate notions as to the amount of schooling which is being given to the children of the State."—(Hartford School Report, 1886-87, p. 31.)

her progress in the decade closing with 1885, as shown in these tangible results; but though slower in these directions, it does not argue that there is not a substantial and certain growth in the educational affairs of the Territory. The statistics herewith reported present a very healthful growth, but the most important results of school work can not be tabulated nor presented in statistics. As the excitements that usually attend rapid settlements and material development in a measure subside, men are disposed to attend more and more to the immaterial affairs of life. We already have ample evidence of this change in the rapidly multiplying private and sectarian schools; in the anxiety which men manifest to secure the establishment of these schools near to their homes, and in an awakening interest in the real progress and work of the school. The past year has been fruitful in new schools, and we may safely assert that education has shared fully in the general prosperity, and in the steady development of the Territory it has more than held its own. The people of Dakota generally have a lively, if not an enthusiastic, interest in the schools and education. They are demanding better schools and are liberally voting taxes upon themselves for the purpose of providing and supporting them. The children are kept more continuously and regularly at school, the best teachers are being sought and employed, and the length of terms is gradually increasing. In many of the counties it is with the greatest difficulty that a teacher without a special training for her work can find employment. Normal schools are increasing in number and efficiency. The demand for more numerous opportunities to obtain a professional training for the work of teaching was met by the last Legislature in an act authorizing the appointment of certain schools to give a normal training at the expense of the Territory. The creation of the Territorial board of education, by increasing the number of persons in the educational department, has made that department more prompt and efficient, and enables it to perform all of its duties and to have more time to unify and systematize the educational work. The county supervision is becoming very efficient. The increase of school interests has, in the first place, made it necessary to secure capable men for the office of county superintendent, and the increasing wealth of the people has, in the second place, made it possible to secure them. There are numerous instances where men of eminent ability and of extended experience in the school work of our Eastern States are now superintendents of some of our counties. School men are being sought for these positions and are generally chosen."

EXHIBIT OF GROWTH.

Years.	Youth of school age.	Enrolled in public schools.	Average daily attendance.	Ungraded schools.	Average number of days taught.	Whole number of teachers.	Average monthly pay of men.	Average monthly pay of women.	Value of school property.	Expenditures for school purposes.
1875	8,343	4,428	208	\$35.00	\$25.00	\$24,926	\$32,603
1879	18,535	9,822	4,681	315	97	464	36.00	25.00	133,952	75,959
1883	56,476	33,985	20,560	1,356	93	1,517	39.70	30.70	537,764	529,837
1887	109,475	87,131	58,379	3,856	112	4,924	31.81	30.33	3,265,590	1,635,561

"The foregoing table shows somewhat of the remarkable growth made by Dakota and her school system during the twelve years beginning with 1875 and ending with 1887. Not only do these figures show a vast increase in the school population, and a consequent increase in the number enrolled, but it shows that in proportion to the whole number a larger per cent. of the children are enrolled in the schools, and further that those enrolled are attending more regularly than in the forepart of the period covered by these statistics. In 1875 only 53 per cent. of the children of school age were enrolled in the schools and the same per cent. in 1879. In 1883 the per cent. had increased to 62, while the report of 1887 shows that 79 per cent. of the school population attended school for the whole or part of the year. During the year 1879 only 25 per cent. of the school population were in regular attendance at school. The per cent. of the population attending regularly in 1883 increased to 37, while in 1887 we make the magnificent showing of 53 per cent. attending every day for the whole term of 112 days. In this respect Dakota leads nearly all of the States.

"The whole number of teachers has increased from 208 in 1875 to 4,924 in 1887, but the average wages for the same period show a slight decrease for the male teachers, while the wages of the female teachers have increased from \$25 in 1875 to \$30.33 in 1887.

"The school population multiplied thirteen times during the period from 1875, and at the same time the number of schools multiplied twenty times. In 1875 there was one school

for every 40 pupils of school age, and in 1887 there is one school for every 28 of the children of school age. These figures explain in part the more general and regular attendance during the last years of the period, but only in part. Much of the increase in the attendance is doubtless due to the increase in the wealth of the people. Many parents in the early days were compelled to keep their children at home to work in various capacities on the farm. The steady prosperity of these years has given many more of the comforts of life, and has enabled parents not only to do without the service of the children, but to provide them with books and clothing necessary to attend the schools. The real object and best results of the public school will be most nearly realized in that community where the largest proportion of the population comes most directly under the influence of the school. In these items Dakota bears comparison with any of the older States of the East, which surely argues that she has accomplished much in the few years since the organization of her school system.

COMPARISON WITH OTHER STATES.

"Probably no State or Territory in the Union has had such a remarkable growth as Dakota. Surely none have accomplished so much in the same period of time; indeed, many have not accomplished as much in much longer time. What we have done is shown in our growth; what we are is best shown in comparison with other States. In school population Dakota leads Colorado, Delaware, Florida, Nevada, New Hampshire, Oregon, Rhode Island, Vermont, and all of the Territories.

"In the number of her teachers Dakota is ahead of Arkansas, California, Connecticut, Delaware, Florida, Georgia, Louisiana, Maryland, Nevada, New Jersey, New Hampshire, Oregon, South Carolina, Tennessee, Vermont, and West Virginia.

"Dakota has more days of school than Colorado, Florida, Kentucky, Louisiana, Maine, New Hampshire, North Carolina, Oregon, South Carolina, Tennessee, West Virginia, or any of the Territories, except Arizona and Utah.

"In the value of her school property Dakota exceeds all of the States and Territories, except California, Connecticut, Illinois, Indiana, Iowa, Kansas, Massachusetts, Michigan, Minnesota, Missouri, Nebraska, New York, Ohio, Pennsylvania, and Wisconsin. In the amount of expenditures for the support of the public schools Dakota is in the lead of the same list, including Connecticut."

"When it is considered that Dakota's population is scattered over such a wide area, that she is supposed to be more unfavorably situated as to her climate, and that her soil has, until a few years ago, been useless as maintaining civilized life, this feature of the report is perhaps the most surprising to those unfamiliar with the work of education in this Territory, and the most satisfactory to those interested in the educational progress of Dakota.

RECENT SCHOOL LEGISLATION.

"There has been for some time a demand for a new school law or a considerable revision of the ones in force in the past. The Legislature of 1887 undertook to revise the law, or rather to make a new law. The main features of the law are good and quite satisfactory to the people, but the same may be said of the law of 1883, which was repealed by this act. The demand for a change was more for a change in a few of the minor features of the law, and for harmony in the territorial system. It may be doubtful whether, in these respects, the new law has accomplished what it was intended to accomplish. Heretofore, seventy-one of the counties were operated under the township system, and were known as the township counties; fifteen counties were operated under the district system; and besides these two systems there were many towns, cities, and villages operated under special or general acts passed by various Legislatures. The new law does not aim to harmonize these systems, but simply takes the place of the law of 1883 in the seventy-one counties to which the latter applied. It does, however, provide a general law for the organization of towns and cities as independent schools.

"The law of 1887 has made considerable change in the organization and administration of the school system of the Territory. The general supervision and control of public instruction is vested in a Territorial board of education consisting of three members appointed by the Governor. The Territorial superintendent is a member of the board and its chairman, and when the board is not in session the other members are assistant superintendents. The members of this board at present are Eugene A. Dye, of Mellette, superintendent; George A. McFarland, of Scotland, secretary; and Frank A. Wilson, of Bathgate, vice-president. This board prescribes the rules for all institutes and examinations, prepares all examination questions, grants Territorial certificates, provides for the printing of the law and of all blanks and reports, directs the superintendents of counties in their work, and makes annual report to the Governor. The township organization is somewhat changed. Each school has a representative upon the township school board, and each school district has definite fixed boundaries. The township school board is by law required to grade teachers' wages according to the grade of certificate held. The county superintendent of schools is now to be elected in June instead

of at the general election in November. The number of subjects upon which teachers are examined has been increased by the addition of physiology and hygiene for all grades of certificates, and of algebra, geometry, natural philosophy, civil government, physical geography, book-keeping, and theory and practice for those who desire the first-grade certificate. The Territorial board of education is authorized to designate ten auxiliary normal schools, and provision is made whereby the township school board may establish and maintain a high school for the township at its expense.

FINANCES.

"The financial condition of most of our school corporations is very good. The amount of outstanding warrants is not large, and they are good for their face value and are easily sold at a small discount. The school bonds find ready sale at their par value, and in many instances are sold above par. The unpaid warrants draw interest at 8 per cent., and the bonds vary from 7 to 8 per cent. The interest on bonds is usually paid promptly when due, and the bonds are in most counties cancelled at maturity.

"Taxation for the support of common schools is of four kinds: (1) The county clerk at the time of making the annual assessment levies a tax of \$1 upon each elector; (2) at the same time he levies an additional tax of 2 mills upon each dollar of taxable property in the county, and the fund raised by these two is apportioned to the children of school age resident thereof as shown by the last school census; (3) a township tax not exceeding 3 per cent. of the taxable property of the township is levied by the township board for the support of the schools of the township; (4) the patrons of any given school may meet in what is known as a subdistrict meeting and vote an additional tax upon their own property for the support of the school of their own subdistrict. The tax levied for schools is spread upon the tax list by the county clerk the same as levies for other purposes, and the taxes are collected by the county treasurer. The funds raised by county taxation are apportioned by the county superintendent to the several corporations in the county in the proportion before mentioned. The money is drawn from the county treasury by the several township treasurers, and is by them paid out upon orders from the township clerk."

SCHOOL LANDS.

"The subject of the school lands is one of great interest to the people of Dakota, but owing to the fact that these lands are still held in trust by the National Government, there is very little definite information concerning them among the people. The educational department not having any authority in cases in which they are involved has not taken the time from numerous other duties to make inquiry about their condition or value. The reports have often come to the Department, and complaints have been made that the school lands were being quite generally cultivated in some parts of the Territory, that valuable timber was being taken from those sections where it is growing, and that the lands were otherwise being despoiled. The complainants have been informed that the Department has no jurisdiction, but the complaints becoming more frequent of late, the Department determined to send out circulars of inquiry concerning school lands, and so far reports have been made from seventy counties, and from these reports the following information has been gleaned: It shows that in several localities there are persons that care more for present gain than for the future of the school fund. The danger is that if the tendency to cultivate and occupy these lands is not checked, there will be so strong a sentiment in certain parts of the Territory in favor of the settler on school lands, that it will have a controlling influence in State legislation on this important question of the disposal of the lands—an influence that will be to the advantage of the settler and in favor of a great public wrong. Every crop removed from the land diminishes the value when put upon the market, and the cultivation of them ought to be in some way regulated if Dakota is to receive her generous gift in all its fair proportions. The seventy counties reporting have a total of 3,684 sections of school land, or 2,347,760 acres. The average value of the land, if put upon the market at the present time, is \$5.50 per acre, as estimated in the different counties. At this rate a fund of \$12,912,680 would be realized from the sale of lands in seventy of the counties."

DELAWARE.

[From Report of State Superintendent T. N. Williams, 1884-86.]

GROWTH OF THE FREE SCHOOL SYSTEM.

A survey of the educational work in Delaware reveals the undeniable fact of real progress. No State in the Union, according to the belief of Superintendent Williams, is developing more rapidly its educational interests than is Delaware. "Gladly we survey the results of patient years of growth and look hopefully to the future. Our district

schools are improved, and all of our towns are seen to vie with each other in the elegant and commodious buildings to be found all over the State. It affords me satisfaction to bear testimony to the fact that the prejudice against free schools is fast giving way, and the people are beginning to look upon them as the surest and only means by which a large portion of the rising generation can ever hope to acquire an education sufficient to fit them for intelligent citizenship. As the schools of every community answer to local public opinion, their success must depend on the sympathy and appreciation of the people. We can not go ahead of public sentiment, but we can endeavor to make it a correct one. Of one thing we are assured, our schools are taking year by year stronger hold upon the affections of the people. Our work is but begun. A complete, well-organized system may be yet far in the future, but I believe it is *there*, and though we may be long in reaching a perfect system, we are constantly attaining to a *better* one."

SCHOOL ACCOMMODATIONS.

During the last two years something over \$125,000 have been spent in the erection and improvement of school buildings in different parts of the State. Many convenient and attractive houses may now be seen scattered through the rural districts, evidencing an enlightened regard for the public welfare, and assuring the intellectual and moral elevation of the young. In the towns and larger villages, structures of a higher order of architecture have been erected and furnished in a style to adapt them to the most approved methods of teaching. Apparatus, black-boards, globes, maps, charts, and whatever else experience has proved to be useful in the work of instruction, have been supplied with a liberal hand. These are exponents of a degree and kind of public intelligence that apprehends the sources of prosperity and power; but there are some sections in which the accommodations provided for the education of children are *poor*, very *poor*. In some localities have been found pupils sitting on seats that seemed designed for engines of torture or instruments for effecting a permanent deformity.

AGRICULTURE.

The desire manifested by many throughout the State to have taught in the public schools some practical study on the subject of agriculture meets the hearty approval of Superintendent Williams. The State board of education has been unable to procure a suitable book for that purpose; but in a short time this study will probably form an important feature of the student's work.

SCHOOL LIBRARIES.

Special efforts have been made during the year to have school libraries established in connection with the school, and in several localities they have been attended with success. There are already several districts supplied with good school libraries.

EXAMINATION OF TEACHERS.

During the past year 621 candidates have appeared for examination; 473 candidates have secured certificates, and 148 have been rejected. Life certificates have been issued to 7. The oral and written methods in examinations are still employed. The standard has been raised from year to year to satisfy the increasing demand for thoroughly competent teachers, while the questions have been of a plain and practical character. It can not be denied that teachers under the system of examination made use of show marked improvement from year to year, and many of them produce good results in their respective school rooms. The essentials which go to make an efficient teacher are various, many of which can be known only by actual observations in the school room. The superintendents have constantly endeavored to impress upon the minds of the school commissioners that literary attainments are not the only essentials of a successful teacher, and that their duties do not cease "with the mere looking at" the teacher's certificate. Time is required to show the unfitness of a teacher who evinced competency upon examination. Indifferent teachers are being gradually eliminated and efficient ones substituted. This can not be accomplished instantly, but will be done, it is not doubted, as fast as is consistent with the rights of the teachers and the good of the schools.

FREE TEXT-BOOKS AND LIBRARY BOOKS.

Superintendent Williams expresses himself as of the opinion that the time has come when the State would furnish text-books free to pupils. He also recommends that an act be passed requiring the superintendent to furnish to the clerk of each school district, at cost price, a library of text-books sufficient to meet the wants of the school, and that the same be charged to the district, and that the amount be deducted from the school dividend by the auditor in his settlement with the clerk of the district.

COLORED SCHOOLS.

For an account of the colored schools of Delaware, see Chapter XIV.

NEW LEGISLATION.

The following is the substance of an act making important changes in the administration of the common school system, passed April 4, 1887:

SEC. 1. *State superintendency abolished.*—The offices of State and assistant State superintendent of free schools are abolished after the expiration of the term of office of the present incumbents, and in lieu thereof county superintendents are appointed.

SEC. 2. *Qualifications of county superintendents.*—County superintendents shall be of good moral character, and well qualified for the office by their mental and scholarly attainments. Their term of office is to be one year. They shall be residents of the county for which they are appointed, and continue such during their term of office.

SEC. 3. *Duties of county superintendents.*—The superintendent shall visit each school within the county for which he is appointed at least twice a year, each visit to be of not less than two hours' duration, provided said school is kept open at least eight months each year. He shall note in a book to be kept for that purpose the number of scholars, the condition of school buildings, grounds, and appurtenances, the qualification and efficiency of teachers, the conduct and standing of the scholars, the method of instruction, and the discipline and government of the schools. In the visits of the superintendent to the schools, he shall advise with the teachers respectively, and give them such instructions in regard to discipline and teaching as he may deem necessary, and shall have power to suspend or withdraw any teacher's certificate upon his refusal to comply with the reasonable directions of the superintendent, subject, however, to an appeal, as in other cases. He shall, by every means in his power, strive to promote and advance the cause of education and interest in the schools, and, in order to secure his entire time, he shall not engage in any other business, or pursue any other calling.

SEC. 4. *Teachers' examinations and certificates.*—The superintendent shall examine all persons who apply to him for that purpose, and who propose to teach in the county for which he is superintendent, and any one interested may attend such examination, which may be oral, or by printed or written questions, or partly by each method. These examinations may be at such times and places as the superintendent may appoint. Each applicant who is of good moral character, and who shall be found qualified to teach orthography, reading, writing, mental arithmetic, written arithmetic, geography, history of the United States, English grammar, elements of rhetoric, algebra, geometry, and natural philosophy, shall be recommended to the State board of education for a first-grade certificate, good for three years, unless sooner revoked by the superintendent for cause to be approved by said board. Every applicant who is of good moral character and who shall in examination answer ninety per centum of all questions asked in orthography, reading, writing, mental arithmetic, written arithmetic, geography, history of the United States, and English grammar, shall receive from the superintendent a second-grade certificate, which shall be good for two years, unless sooner revoked for cause to be approved by said board. If any such applicant fail to answer ninety per centum of the questions asked in examination in the branches mentioned for a second-grade certificate, but shall answer at least sixty per centum thereof, he shall receive from the superintendent a third-grade certificate, which shall be good for one year, unless sooner revoked for cause. Any applicant having been refused a certificate may appeal to the State board of education. The superintendent shall also keep an accurate list of all certificates granted by him, with the dates thereof, and the names of the persons to whom granted.

SEC. 5. *Compensation of county superintendents.*—Each one is to receive \$1,000 per annum.

SEC. 6. *Employment of teachers.*—It shall not be lawful for the school commissioners of any school district to employ as teacher any person who does not hold a certificate from the superintendent of the county wherein said district is located, and any one so employed shall receive no compensation whatever.

SEC. 7. *Reports of county superintendents.*—These are to be made annually in writing to the president of the State board of education.

SEC. 8. *The State not to furnish text-books.*—The superintendents provided for in this act shall not be allowed to purchase any of the school books used in the public schools of this State at the expense of the State.

SEC. 9. *State board of education.*—The secretary of State, president of Delaware College, and the three superintendents provided for in this act shall constitute a State board of education for this State, which shall meet on the first Tuesday of January in each and every year in the capitol at Dover at two (2) o'clock in the afternoon. The secretary of State shall act as secretary of said board of education. The president of Delaware College shall, by virtue of his office, be president of said board of education. The State board of education shall hear appeals and determine finally all matters of controversy between the superintendent and teachers, or any applicant for a certificate and the superintendent or commissioners, and between school commissioners and teachers. The State board of education shall determine what text-books are to be used in free schools of this State;

it shall issue an uniform series of blanks for the use of teachers, and shall require all records to be kept and returns to be made according to these forms. The members of the State board of education shall receive no salary or compensation for the performance of the duties thereof.

SEC. 10. *Report of the president of the State board of education.*—This officer is to make a biennial report to the Governor in writing for which he is to receive \$25.

SEC. 12. *Teachers' institutes.*—Each superintendent provided for in this act shall hold a teachers' institute in the county of which he is superintendent at least once a year of at least three days' session, at which time all the teachers of the county shall attend, unless unavoidably detained, at which time the superintendent shall give all the information to teachers within his power, and such other instructions as he may deem advisable for the advancement of education, and have a general interchange of views of teachers as to the wants of the various schools.

In a subsequent section provision is made for a fund of \$100, for the expenses of each county institute.

The above act does not apply to any school or school district managed by an incorporated board of education, unless by special request of said board.

THE STUDY OF SCIENTIFIC TEMPERANCE.

[From Act passed April 12, 1887.]

"Provision shall be made immediately upon the passage of this act by the school commissioners and local school boards for instructing all pupils in all public schools receiving aid from the school fund of the State, in physiology and hygiene with special reference to the effects of alcoholic drinks, stimulants, and narcotics upon the human system, such instruction to be given orally in primary schools where pupils can not read.

"No certificate shall be granted any person to teach in the public schools of the State of Delaware after the first day of January, eighteen hundred and eighty-eight, who has not passed a satisfactory examination in physiology and hygiene, with special reference to the effects of alcoholic drinks, stimulants, and narcotics upon the human system."

SCHOOLS OF NEW CASTLE COUNTY, 1886-87.

Superintendent Bessey, of New Castle County, writes to the Bureau that the schools of that county are in a prosperous condition. The school dividends are greater than ever before. Several beautiful and commodious school houses have been erected and supplied with modern furniture. The school apparatus is generally good, and the teachers are enthusiastic, active, and progressive.

For other information concerning education in Delaware consult the Index.

DISTRICT OF COLUMBIA.

[Report of 1886-87.]

SCHOOL ACCOMMODATIONS.

Although the seven new buildings provided for at the last session of Congress have relieved to a considerable extent the lack of school accommodations, still it will require another and at least as liberal an appropriation for the same purpose to afford accommodation equal to the growing needs of the schools.

Many rooms were rented for school purposes during the past year; yet these failed to meet the demand for more room, so that one-third of the white schools and considerably more than one-half of the colored schools were restricted to half-day exercises. As regards the character of the rooms rented, Superintendent Powell says in his report to the board of trustees: "Your attention is called to the fact that it is yet necessary to rent many rooms to accommodate the growing demands of the schools. Nearly all of these rooms also are unfit for school purposes. In many cases they are dark, small, and inconvenient. In nearly all cases they are without means of ventilation. Teachers can not do good work in them; therefore the work of the school suffers, but the greatest objection to these rooms is that the health of the pupils is constantly endangered. Both teachers and pupils work to a disadvantage and in constant danger. Epidemics find in these places food for fearful ravages. The influence of such environments upon the spirits and of such atmosphere upon the vital organs is a constant depression, and can but be pernicious."

HALF-DAY SCHOOLS.

And in regard to half-day schools: "A half-day at school is enough for a first or second grade pupil, if the school is not well taught or is in an unhealthy, uncomfortable, or uninviting school room. These conditions, however, ought not to exist. The school room should be commodious, well lighted and well ventilated, clean and whole-

some, and not overcrowded. Our teachers are competent to teach well, and where opportunity is given do teach well. The children who go to school in the afternoon are tired because of too much play in the forenoon. It has been the custom in the middle of the year to change the afternoon schools to forenoon schools, and *vice versa*. Thus has the condition of all the primary schools changed in the middle of the year. The progress of the children has thereby been greatly impaired.

"Every child who goes to school should have a desk of his own and should not be forced to give it up to some one, he knows not whom, for half the day. The greater part of the moral effect of school life is lost to the child by the half-day school.

"Manual training begins in the kindergarten and should be continued in the primary school, but the child in the half-day school has no time to draw, to make forms of clay, or by folding and cutting paper, or by laying sticks or other means, has no time to represent forms. His time must be spent in committing to memory that which he may or may not understand, because the scholastic grade work must be done.

"Education should accomplish the best possible mental, moral, and physical good to the child, especially during the first few years of the formative period of his life. In half-day schools no moral lessons can be wrought in the presence of the child and impressed upon him. There isn't time. The teacher must dictate. Thus the moral lessons the child gets at school are the simple *ipse dixit* of one who is almost a stranger to him. The child can not be developed mentally by self-activity, or gain knowledge by investigation under the direction of the teacher. There isn't time. The teacher must dictate and the child must memorize what is dictated whether he understands it or not—not to say whether he knows it to be true or not. He can not be trained systematically in the use of eye and hand, or be given exercises for rest and physical development. There isn't time. The lessons must be learned, and the desks must be cleared out that other children may come and in turn be filled with facts for examination day. That healthy, mental, moral, and physical growth that can come to childhood only by wisely directed, systematic, pleasing, and conscious self-activity can not be realized in a half-day school. That pure, natural, and earnest love for truth and knowledge is never known by the child who receives without question or investigation doses of facts as from the hands of one who has diagnosed and prescribed without explanation. Most of our teachers can do the legitimate work of the primary school properly, but they complain that the half-day school does not afford the time for doing it, and their complaint is well founded. Little time is allowed for calisthenic exercises, for games, for songs, and repetition of mottoes; but all effort must be directed to accomplishing the grade work that can be done only by a continued pouring in, and a nervous, hurried, and too often meaningless memory drill. No one knows this better than the conscientious teacher, and no one speaks of it more frequently or more feelingly. That such *memoriter* work can be found in the schools is too true. That such work is found in the schools is not the fault of the teacher who is forced to do work on the half-time allotment. If we would have more and better training in school and fewer home lessons to be studied by our small children, we must give more time and better opportunity to do the work."

ENUMERATION OF SCHOOL POPULATION.

No enumeration of the children of school age has been made since 1880. Superintendent Powell recommends that "provision should be made for ascertaining biennially, if not annually, (a) the number of children of school age residing in the District; (b) the number of such children attending private and parochial schools, and (c) the number of such children not attending any school, together with the reasons for non-attendance."

CHARACTER OF ATTENDANCE.

It is a general rule in all public school systems that the attendance falls off rapidly from the lower to the higher grades. The white schools of the District of Columbia form an exception in this regard. The attendance in the lower grades, as compared with the population of school-going age, is fully equal to that of the most favored cities; yet a large percentage of these pupils continue on through the higher grades, nearly half of them, in fact, through the entire eight grades. Thus, in the first six divisions, embracing the white schools of the District; there were enrolled in the first grade 3,378 pupils; in the second, 2,729; in the third, 2,904; in the fourth, 3,097, and in the fifth, 3,013; while in the sixth there were 2,294; in the seventh, 1,689, and in the eighth 1,399. The enrolment in the High School was 827.

In the schools for colored children there is a diminished attendance as the grades ascend, more in accordance with the statistics of other cities. Thus, during the past year, the number of colored children in attendance in the first grade was 4,720; in the second, 2,293; in the third, 1,508; in the fourth, 1,267; in the fifth, 868; in the sixth, 546; in the seventh, 350; and in the eighth, 220, with 276 in the High School.

The trustees, in their report, explain this peculiarity, as follows: "The attendance in the primary grades, as compared with the population of school-going age, is equal to

that of the most favored of our sister cities. But the absence of large manufacturing and other industrial enterprises deprives us of a class of pupils common to other cities, whose educational privileges are usually limited to the lowest or primary grades. With fewer accumulations of large fortunes, the wealth of the District is more equally distributed than in most large cities; and with us the average citizen is able to afford to his children opportunity to take the full course of instruction provided in the public schools. The result and the conditions which give rise to it are matters of congratulation to the community, and can not fail to be gratifying to all friends of education."

PAY OF TEACHERS.

The board of trustees earnestly recommends a substantial increase in the salaries of teachers. This class of public servants occupies a most responsible position, calling for intelligence, culture, manual dexterity, tact and delicacy in management, sympathy, patience, gentleness, fidelity, and other qualities of the highest order; their influence is all powerful for good or evil; yet their wages, as compared with that of laborers, door-keepers, etc., is so low as to draw the following just observations from the board:

"The salary of messengers throughout the Departments of the Government is fixed by Congress at \$840 per annum—that of what are known as assistant messengers is \$720 per annum; while the average salary of the cultivated men and women who constitute the teachers of our public schools is limited to \$670 per annum, or only \$10 per annum more than that of a laborer in the Departments. All reside in the same community and subject to the same general conditions which regulate the cost of the necessities of life. That the average salary thus allowed teachers is, in the city of Washington, barely adequate to the comfortable and decent support of a single person occupying that position in life, and that it affords no possible margin for provision for sickness or old age, to say nothing of the maintenance of a family, must be apparent, not only to every citizen, but to every temporary sojourner in our midst.

"Whatever difference may exist upon other subjects, the board feels that it represents the entire community in expressing its regret at the remarkable discrimination against this most important, useful, and meritorious body of workers above pointed out. Nor is it for a moment believed, if only its attention to the subject can be secured, that the Congress of the United States will accord inferior considerations and recompense to the educating class, the teachers of our public schools, than to others, whose duties are neither so important nor exacting, whose qualifications are of a less difficult order, and to whom the cost of living certainly is not greater."

No less than four of the High School teachers resigned last June to accept more remunerative positions in private schools, showing that the salaries are too low to command the services of the best teachers.

PHYSIOLOGY AND HYGIENE.

It is believed that this subject was taught in compliance with the spirit as well as with the letter of the law prescribing it.

For other information concerning education in the District of Columbia consult the Index.

FLORIDA.

[From Report for 1886-87 of State Superintendent A. J. Russell.]

There has been a steady growth of interest throughout the State in the public schools, a constant advance in their efficiency, while a most healthful *esprit de corps* animates the teachers as a rule, a result of which is that much better work has been accomplished. Patrons are becoming more identified with the schools and manifest a deep and lively interest in their encouragement and success.

It can be safely said there are but few children who live in isolated places now in the State to whom the door of the school is not opened without fee or hindrance, of any race or condition of the population, and there is every reason for believing there are comparatively very few of the youth of school age who are not able to read.

Every county in the State, even the most remote and isolated, is organized and has its public schools in operation. The six new counties created by the last Legislature have been organized and started off upon their work at the beginning of the school year, October 1, with less friction than could possibly have been expected, reflecting great credit upon the officers selected to manage the affairs of the schools in those counties.

A convention of the county superintendents was held in February. Eighteen of the thirty-nine were present, and the conference, and comparison of work, the manner of superintendence of the county schools, the difficulties encountered and the impediments

existing and how overcome, made this meeting of county superintendents most profitable and pleasant, every one present expressing great gratification.

The increase in the number of schools is very gratifying; also the increase in the number of teachers employed. New and neat comfortable school-houses have been built all over the State; new and modern improved sittings have been supplied, and much closer attention is given in many parts of the State to the hygiene, ventilation, and light of the school-room and grounds.

COUNTY HIGH SCHOOLS.

County high schools, or graded schools, have been established and are in successful operation in several counties and are doing an excellent work. Notably among the counties having these schools are Duval at Jacksonville, Jefferson at Monticello and Waukeelah, Madison at Madison, Nassau at Fernandina, Saint John's at Saint Augustine, Escambia at Pensacola, Hillsborough at Tampa, and Columbia at Lake City.

These are county schools, open to any pupil who may advance to such grade as is required to enter the high school, from any county school, thus affording an opportunity to all the people of the county who desire a High School course for their children.

It is aimed to make these schools intensely practical and useful. In addition to the branches usually taught in high schools, a business course, embracing book-keeping and business rules, is taught, and normal instruction is given and practice work is afforded in the school in teaching, resulting in giving some of the best, brightest, and freshest young teachers we have in the work. These are in most cases employed as assistants under older teachers, and are thus matured in the work.

There are no city schools exclusive as in some of the States; each county is a school district under the government of a board of public instruction, consisting of five members, who are appointed by the State board of education, and are made a corporate body by the law; and also a county superintendent; and all the schools are county schools, whether in cities and towns or not, and are under the same government.

ARBOR DAY.

On the 10th of February, 1887, Arbor Day was almost universally observed with great enthusiasm and pleasure and profit. The schools, as well as the patrons, look forward in each recurring year for the coming of Arbor Day, and all commend the introduction of its observance as full of blessing and profitable instruction, and desire most heartily its perpetuation.

Three hundred and four schools are reported as participating, and 5,129 trees were planted.

GEORGIA.

NEW LEGISLATION.

The session of the Legislature which closed on October 20, 1887, passed an act revising and consolidating the school law. Among the changes to which Superintendent Orr has called attention are the following:

Apportionment of the school fund.—The apportionment of the school fund no longer has to be laid before the Governor. Time has effected a change in the provision of the old law for including Confederate soldiers under thirty years of age in the school population, and the change thus made is recognized in the Act by omitting them from its provisions.

Expenses of State school commissioners.—The provision of the old law which made the State school commissioner pay his own board and hotel bills when travelling on official business is omitted.

County school boards.—Members of county school boards are made exempt from road, militia, and jury duty, and are to receive no other compensation.

Schools.—One school must be established in every sub-district for white pupils and one for colored pupils, "where the population of the two races is sufficient," and no additional school can be established in the sub-district without an enrolment therein of not less than twenty-five pupils. The schools must be as near "the centre of the sub-school districts as can be conveniently arranged, reference being had to any school-house already erected and population of said sub-school district, and to the location of white and colored schools with regard to contiguity." The power to change district lines remains intact.

Text-books.—There shall be no change in the books adopted for a term of five years, save by a three-fourths vote of all the board. This would require the concurrence of

four members. Should a teacher allow a pupil to use any other than the prescribed books, he can not receive pay from the public fund for that pupil.

Qualifications of county school commissioners.—Applicants for the office of county school commissioners must submit to an examination by the president of the board, or by some one appointed by him, or by the board for that purpose. This examination is by means of questions furnished by the State school commissioner and is on the subjects taught in the common schools, "upon the science and theory of common school teaching and government, and upon such other subjects as the State school commissioner may deem proper." "The said county board of education shall then elect such applicant county school commissioner who has stood satisfactory examination, taking into consideration the moral character, business qualifications and general availability of each applicant."

Examination of teachers.—A new branch is added to those formerly examined upon, viz: "The science and practice of teaching in common schools," and the questions are to be prepared and furnished to the county school commissioners by the State school commissioner. He also instructs as to the grading of applicants, and fixes "the lowest standard for each class of licenses." County school commissioners grade the applicants according to the State school commissioner's instructions and submit to the board a written report and recommendation. The board licenses, provided the applicants obtain the lowest mark fixed for the several grades by the State school commissioner. Evidence of good moral character is required to be submitted in writing. Fourth-grade licenses are abolished. The Act requires the State school commissioner to fix a "day, or days," for the examination of all teachers throughout the State. The county school commissioner is to give notice of the day (not days) on which examinations are to be had. No teacher can be examined at any other time except on affidavit that "he or she was providentially hindered from being present on the general examination day, or days, and has not seen or been informed of the contents of the general question papers." Papers of unusual merit may be forwarded to the State school commissioner, with an indorsement by the county school commissioner of the author's good moral and professional character. Upon these papers the State school commissioner may issue a permanent State license, revocable for "good and sufficient cause" by him only.

Co-education of white and colored pupils.—"No teacher receiving or teaching white and colored pupils in the same school shall be allowed any compensation at all out of the common school fund."

"Ambulatory schools" abolished.—The provision of the old law permitting a two months' school term instead of three in sparsely settled districts, the terms being so arranged that the same teachers might serve in two or more schools, has been rescinded.

Attempted legislation.—A number of bills to increase the school revenues were introduced, prominent among which was one to levy an annual tax of one-tenth of one per cent. upon the taxable property of the State for the support of common schools; it did not pass, however, and the sources of the State school revenue remain practically as before, nearly stationary, while the number of school children is continually increasing. Superintendent Orr says, however, that there was a stronger feeling in the House in favor of increasing the school fund than there has been for a long time.

IDAHO.

[Report of Superintendent Moody, 1886-87.]

SCHOOL SYSTEM.

"Our school system is that commonly known as the 'common-school plan,' designed to give all resident children an education in the elementary branches, and is similar in character to that in many of the Eastern States.

"The school officers consist of a Territorial superintendent of public instruction, a county superintendent of schools in each county, and a board of three school trustees in each district."

NEW SCHOOL-HOUSES.

"I think that all is being done that can be reasonably expected of districts in the parts of the Territory remote from markets and transportation, in the matter of erecting school houses. In what may be termed the new communities, the lands are not yet patented, and only the improvements and personal property of the settler are placed upon the assessment roll and subject to taxation for school-house purposes, so that until such time as the land is patented and the assessment roll shall show the true value of each man's property in the district, we can not expect that much will be accomplished except what may be done by voluntary subscription. It is a matter of regret that very many districts are obliged to use structures erected and owned by religious societies, in

default of owning school houses of their own. No district should be placed at the mercy of any religious society, or be compelled to keep its school in any building not owned or controlled by the trustees."

THE MORMON COUNTIES.

"Much trouble has been experienced, and more is to be apprehended, in connection with the problem presented under the existing laws of the Territory and the sentiments of the members of the organization known as 'The Church of Jesus Christ Latter Day Saints,' hostile to the carrying out of the provisions of the law applicable to the public schools.

"The board of school trustees is composed of three members, one of whom goes out of office and his successor is elected on the first Monday of September in each year, in each district. Among other requirements of the law, each incoming trustee takes an official oath in which is embodied the test oath annexed to this report.

"In certain portions of Bear Lake, Bingham, Cassia, and Oneida Counties there are school districts in which there are no 'Gentiles' eligible either for election or appointment as trustees. The entire community is 'Mormon.' No 'Mormon' can take the official oath without danger of conviction of perjury. Hence but two trustees remain in office in such districts. Next year there will be but one trustee, and where there is but one trustee the schools can not be carried on. In many districts, I am informed, the latter is the case already arising from the fact of vacancies caused by death or removal of one of the trustees prior to the last election.

"The school superintendents of the above-named counties (except of Bear Lake) have, in the discretion given them by law, held that a person who belongs to an organization which teaches things defined by our statutes to be crimes, as a matter of performance of a religious duty, is not a law-abiding citizen or a person of good moral character, and therefore they refuse to license any member of that organization to teach in our public schools. The 'Mormons,' represented by the reputed leaders of their organization, have notified this office that in cases where 'Gentile' teachers are employed, they will not permit their children to attend the public school, but will either cause schools to be started by subscription, wherein their children can be under the instruction of 'Mormon' teachers, or else keep their children at home.

"The issue seems to be, either that the schools of Idaho, in those districts, shall be subject to the control and supervision of the priesthood of the so-called 'Mormon' church, or else that they must be closed. Their leaders set up no reasonable excuse for this demand or threat, nor do they allege that 'Gentile' teachers endeavor to enforce any sectarian, political, or denominational doctrines in the schools which their children attend.

"From an extended and patient investigation I am satisfied that the real reason why they do not wish their children to attend non-Mormon and non-sectarian public schools is, that they do not wish them taught that obedience to the law of the land is one of the evidences of good citizenship, or that acts which the 'Mormon' church denominates a religious duty or privilege are, in fact, crimes against the law of the land, and that they fear that under the instruction of non-sectarian teachers the rising generation, which is now taught by the priesthood that violators of the law when punished are 'martyrs for conscience sake,' may learn the contrary to be true.

"So far as I am advised, every effort has been made by the superintendents to keep the schools open in accordance with the law. It is a matter of deep regret that the innocent children must be made to suffer for the fanaticism and disloyalty of their parents. With every sentiment and desire to extend the facilities and advantages of a non-sectarian public school education to all the children, without regard to the religious or political creeds of the parents, existing among those who have the general supervision of the schools and the administration of the law, the responsibility for the continuance of blind faith in the leadership of an organization teaching crime to be duty, and for the prevalence of ignorance in the years to come among those who should now be studying in the public schools, but who are not because of the hostility of their parents, must rest upon the infatuated fathers and mothers of the children upon whose future they invoke the curse of ignorance, and not upon school officers who would help the children to knowledge."¹

TEMPERANCE INSTRUCTION.

"The Act of Congress approved May 20, 1886, concerning the teaching of the effects of alcoholic drinks and narcotics upon the human system, has been complied with except

¹ In a letter to this Office under date of December 13, 1887, Superintendent Moody says upon this point: "I am happy to say that reports from two of the counties where the trouble had arisen show that the Mormons are taking a more sensible view of the situation. It is an unfortunate and bitter fact, but we propose to make Americans of the rising generation in spite of the priesthood's efforts to the contrary."

in a few instances. As a general rule the law has met with but little opposition. In my judgment the terms of the first section of the act are too severe, and if a strict construction be put upon the language thereof, it will be impossible to comply literally with the law. Strictly construed, it requires a child to study hygiene and the nature and effects of alcoholic drinks and narcotics by the use of text-books before the child can read.

"By Act of the last Legislature every parent or guardian is required to send his child to school for at least twelve weeks in each school year, eight weeks of which must be consecutive. This act applies only to children between the ages of 8 and 14 years who reside within 2 miles of the school-house by the nearest travelled road. A failure to comply with said law subjects the parent or guardian to a fine of not less than \$5 nor more than \$50. There are many exceptions made in the law, and the board of trustees in each district is permitted to excuse the parent from complying with the provisions of the law. As a fair test of its efficiency can not be made at present, it is impossible to say whether or not its effects will be beneficial.

"Sections 16 and 36 in each surveyed township are reserved for public school purposes. There being no record kept in the surveyor-general's office of the number of surveyed townships in this Territory, I am not able to state the number of acres or sections now reserved."

BENEFITS OF A MORE RIGID SUPERVISION.

"The separation of the office of Territorial superintendent from that of the comptroller occurring but a few months ago by enactment of the Fourteenth Legislative Assembly, has afforded opportunities for a more rigid inspection and supervision of the schools generally. I have visited nine of the fifteen counties. A detailed report at this time is not feasible, but I would remark in general that I am satisfied that the effects of such visitations are good, and that they tend to a renewed interest on the part of parents and teachers and all school officers. Thus far I have discovered escheated estates amounting to about \$3,000, and proceedings are being taken by which the Territorial treasury will soon receive the benefit of that sum.

"It is a difficult matter to impress upon school trustees, as well as upon county superintendents, the necessity of complying strictly with the law regarding our school system. Many of the trustees are illiterate, and too often the business of the district is neglected. I do not hope, after affairs have run so many years without supervision worth mentioning, to at once correct all mistakes, but trust that a gradual improvement may take place and eventually reach the point already attained in the Eastern States of the Union."

MORE MONEY NEEDED.

"The Territory needs money to perfect the work of education and to extend aid to the poorer districts. With the school lands not available and with no national assistance, we can only rely upon the assistance of the people and await the time when by reason of increased taxable wealth we can better help ourselves."

ILLINOIS AND INDIANA.

No school reports for 1836-37 are issued by either Illinois or Indiana. For what statistical or other information concerning education in these States is in the possession of the Bureau, consult the Index.

IOWA.

[From Report of Superintendent J. W. Akers, 1884-85 and 1885-86.]

GENERAL REMARKS.

"It is gratifying to be able to report a most satisfactory and prosperous condition of education throughout the State. The past two years have been years of increased interest, activity and growth. This applies to no particular county or locality, but is general. The number of school-houses has been increased by about five hundred, and their aggregate value by more than \$550,000. The number of teachers is increased by about five hundred, while our school population is ten thousand greater than the same as reported two years ago.

"The total number of teachers attending normal institutes in 1884 was 14,794. This report shows 18,026.

"Our report for 1884 shows \$4,962,276 raised by district taxation. For 1886 the amount is \$5,200,807; showing an increase of \$238,531. This does not represent our entire receipts for 1886, that being, for the three funds, \$6,514,639.56. The aggregate dis-

bursements of the three funds for 1884 were as follows: School-house fund, \$1,182,544.15; contingent fund, \$1,329,459.91; teachers' fund, \$3,724,966.54; making a total of \$6,236,847.82. For the year 1886 these amounts are as follows: Total disbursements of the school-house fund, \$952,540.03; contingent fund, \$1,361,749.39; teachers' fund, \$4,008,883.54; making the total disbursements of the three funds for 1886, \$6,323,172.42; leaving on hand in all funds, \$2,091,028.29.

"Since 1884 there has been quite a decrease in the amount of money expended for school-houses and sites. The years 1883 and 1884 were remarkably active in this respect, as compared with earlier and later years. The explanation of the falling off of the last two years is, of course, to be found in the hard times and the general depression in business enterprise."

In connection with a tabulated statement of receipts and expenditures for the past six years, the superintendent remarks: "These tables will reward a careful study. It should be remembered that thousands of boards of directors, acting entirely independent of each other, contribute to these grand totals; that while they represent millions of dollars received and disbursed, they vary but a few thousands from year to year; and these variations usually represent an increase in the current expenses, consequent upon the growth of the system. There could be no more satisfactory showing that boards of directors as a rule are honest and regular in the transaction of business and in disbursing the people's money, than is to be found in the regularity of these annual totals."

TEMPERANCE INSTRUCTION.

"The county superintendents are entitled to great credit for the general success which has attended our law requiring that scientific instruction in physiology having special reference to the influence of stimulants and narcotics upon the human system, should be taught in all public schools. The law has been very generally obeyed. Owing to the fact that while the law went into effect on the 1st day of July, 1886, and the provision that teachers should be examined on the subject after July, 1887, many boards of directors, supposing that the law would not come into full force and effect until July, 1887, failed to make immediate preparation for teaching the subject as early in the year as should have been done. There were those, no doubt, who, being unfriendly to the law, intentionally neglected making the required provisions, and subsequently claimed not to have understood that they were required to do anything in the matter before July, 1887.

"These cases were not numerous, however, and it is to be hoped that hereafter the law will be honestly and faithfully carried out in all schools.

"In all county superintendents' conventions held in the spring and summer following the enactment of this law, the subject was very generally and thoroughly discussed, and an earnest desire manifested by the great majority of superintendents to secure an observance of all its provisions in their several counties. It soon became apparent, however, that the construction and execution of the law was attended with many difficulties. For the purpose of clearing the subject of these difficulties, so far as possible, a circular letter containing notes and suggestions of an advisory character was issued by the superintendent. In accordance with the views of the superintendent therein expressed, (1) the influence of alcohol, etc., should be taught 'in each division of the subject,' such as nutrition, digestion, circulation, etc., and that text-books that did not so teach it did not conform to the law; (2) 'regular' teaching should be construed to mean daily teaching; (3) the subject should be studied by all pupils, from the primary classes through the high school; this must continue until satisfactory examinations have been passed; (4) it is made the duties of boards of directors not only to provide that certain instruction shall be given, but to see that it is given; (5) the duty of reporting the manner and extent to which the law has been complied with is made mandatory upon the county superintendent.

"One of the principal difficulties experienced in carrying out the provisions of this law has been the unwillingness of many parents to purchase text-books for their children. To avoid trouble where any considerable number of parents have shown an unwillingness to provide the necessary books, boards have simply directed their teachers to teach the subject orally.

"While under some circumstances such teaching amounts to a compliance with the law, in many cases it is simply an evasion. Where boards of directors have secured the preparation of a complete outline, covering the entire subject of physiology, and having special reference to stimulants and narcotics, and containing information either by statement or reference, and where such outline has been formally adopted and the teachers officially notified that they are required to teach the subject regularly, and where it is so taught from such outlines, it has been held that this is a compliance with the law. But where boards have simply requested their teachers to teach the subject orally and have not provided for and regularly adopted an outline or course of instruction, it is

not a compliance with, but an evasion of, the law. Boards are required to 'make all necessary provisions,' and to see that the subject is regularly taught. Owing to the fact that sources of information on this special phase of physiology are scarce, and that many of our teachers are young and comparatively inexperienced, a text-book in the hands of both teacher and pupils is a great advantage if not a necessity."

TEXT-BOOKS.

The superintendent renews his recommendation in favor of a law permitting the electors of any school district to authorize the board of directors to purchase text-books, the use of which is to be free to the children of the district.

ARBOR DAY.

In regard to Arbor Day, Superintendent Akers says: "Chapter 23, Laws of 1883, makes it the duty of boards of directors to plant shade trees upon school-house sites, and authorizes payment from the contingent fund. In obedience to this law, thousands of young trees have been planted; but this necessary improvement has so far been neglected in many districts. For the purpose of encouraging tree planting, and investing the exercise with all possible interest, I issued a circular letter, under date of April 4, 1887, designating the 4th day of May to be generally observed by all the schools of Iowa as Arbor Day. The day was very generally observed, and many interesting and delightful exercises were held. Owing to the early opening of the season, May 4th proved a little late for many varieties of trees, but it is believed that May 4th will be early enough for the average season. The hard-wood trees should be selected, and the planting of such trees may safely be deferred to May 4th."

For additional information concerning education in Iowa consult the Index.

KANSAS.

REPORT ON THE KANSAS SCHOOL SYSTEM BY A COMMITTEE OF THE KANSAS STATE TEACHERS' ASSOCIATION.

To the Kansas State Teachers' Association:

The committee appointed at the last annual meeting of this association to report on the desirability of a change from our present district system to either the township or county system, early in September sent a circular of inquiry to every county superintendent in the State. More or less complete reports were received from about forty counties, and these faithfully represent the condition of all parts of the State, as will be found in perusing the tabular statements embodied in this report.

In the first place, let us ask attention to the fact that the present system results in a choice of three school officers from a very small community, and from a very limited number of men.

They may be (perhaps generally are) as good men as can be found in that community; but this fact does not relieve them from being only too often very poor school officers.

Now the county superintendents referred to, in making their special reports, answered very generally this question: "How many school officers in your county visit their schools?" A careful compilation of the replies shows that out of nearly 8,000 officers only some 1,300 (or less than one-sixth) discharge this very plain duty. In other words, the result is the same as though in all the odd-numbered districts the officers never visit their schools, and in the even-numbered districts only one member of the board knows by personal observation the conditions and needs of the weighty matters intrusted to him!

This would seem bad enough, and might well cause us to look more carefully into district affairs; but there is worse than this. Another question was: "What proportion of your school officers thoughtfully and intelligently discharge their duties?" It is quite possible that some school officers are busy men, with no time for visitations—and yet give much thought to their work. It is not impossible that excellent teachers make visits from the board almost unnecessary. But there can be no excuse for carelessness, thoughtlessness, or incapability. Yet answering for more than 7,000 officers, but 2,000 were reported favorably. On an average, then, in each district about seven-eighths of a man "thoughtfully and intelligently discharges his duties" as a school officer! And the education of our children, and intelligent citizenship, and the future of this State, depend largely on the results of this two-sevenths management! Is it not time to investigate, to see whether the system or the men are to blame; to see what remedies are needed, and what can be applied?

It is quite probable that districts do as well as they can in selecting officers. Further, the superintendents in question have doubtless understated rather than overstated the evils prevalent in their own counties. This last should be constantly in mind. Men speak as favorably as possible of their constituents, even in confidential and privileged communications. We may be sure that the case is worse than actually reported, rather than better.

To proceed: Superintendents having within their jurisdiction over 7,000 officers report 2,000 of these as "wholly unfit for their positions." It might be questioned as to the respects in which these officers were unfit, but on one point the returns are painfully explicit. It is with much hesitation that we quote the figures. As Kansans and citizens we are ashamed of the showing. But we believe that the evil will never be remedied till the facts are brought to the public eye, ear, and conscience.

Asked, "How many officers are virtually illiterate?" the gentlemen interrogated say more than one fifth—1,600 in 7,200 (round numbers)!

We wish to pause right here to ask careful consideration of the facts thus made prominent. As business men, as practical men, it is time citizens carried to school matters practical and business sense. If taxes are not a good investment, then taxes had better come to an end. They can not be a good investment, however, when expended by a body of men a large per cent. of whom have no knowledge of the business, while still a larger per cent. give it no attention whatever. If of any 70 hired men only 13 gave the business in hand the benefit of their presence and personal effort, 21 "thought about it," and 36 knew nothing about it at all, how long could the employers of such laborers keep out of bankruptcy? Suppose that Superintendent Parnham, at the capitol building, should report to the commissioners: Total number of men employed and paid, 70; average reporting for duty, 13; number who say "they are thinking about it," 21; cripples, blind, and "wholly unfit" for work, 36; about how long before Superintendent Parnham would be on his journey to Lawrence?

Yet this is precisely what we seem to be doing all over this State—partly because we are wedded to precedent (the district system), and largely because we are so very busy making money that we can not stop to see that it is wisely expended.

For our children's sake, if not for our own, we should seek a remedy for the prevailing inefficiency of a large per cent. of our rural schools.

There is another phase of our present system which is almost as disheartening as the wretched showing made in official zeal and ability. That is, the limitations, inequalities, and rank injustice of the resulting taxation. We are generally so alert to perceive that which touches our pockets, that it is remarkable that this inequality of burdens has not made itself felt before.

From part of the reports referred to the following contrasts have been drawn. The figures may speak for themselves. They are said to be confined to districts in which one teacher only is employed:

County.	Lowest district valuation.	School population.	Highest district valuation.	School population.
Anderson.....	\$10,245	30	\$47,505	67
Atchison.....	14,600	93	105,160	65
Crawford.....	12,114	54	53,710	58
Chautauqua.....	5,267	40	29,706	41
Cloud.....	9,770	55	65,826	57
Cherokee.....	4,015	28	63,242	74
Dickinson.....	12,481	30	57,747	73
Doniphan.....	12,021	78	81,102	41
Ellisworth.....	7,570	21	80,398	81
Elk.....	6,577	12	52,844	60
Ellis.....	3,491	23	86,207	63
Edwards.....	3,980	47	53,764	24
Hodgman.....	4,495	23	52,993	43
Harvey.....	7,249	17	61,198	35
Harper.....	7,680	33	53,775	106
Jewell.....	6,881	36	33,040	34
Marion.....	10,206	30	58,751	45
Mitchell.....	4,747	21	61,377	64
Rooks.....	1,674	37	28,175	53
Rush.....	1,489	15	23,857	43
Sedgwick.....	15,460	23	191,650	72

Remember, these are communities within the same county limits, in some cases side by side, engaged in the same struggle for existence and for education, as one of the essentials to an enjoyable existence. By a purely artificial division of territory, by lines

which can not be seen but can be most severely felt, for reasons that are frequently inscrutable and are often those of some little clique with political influence, these people find themselves under the most unequal system of taxation that can be devised. Why should Atchison County be so divided that one community has over \$1,600 assessable values for every child of school age, while another has but \$150? Why has one district in Chautauqua \$725 assessable for each child, and another but \$125? What thoughtfulness, or justice, or equity can be claimed for a system that produces such results as can be seen through the entire list.

The showing ought to arouse public indignation. The least it can do is to promote discussion.

It will, perhaps, be objected, that the contrasts exhibited in the statistical tables were exaggerated in this respect; that they touched extreme cases only. It is impossible, of course, to make a minute showing of every phase of the present slovenly, unjust, and inequitable system of managing and providing for our schools. But, in order that the question may be wisely discussed, and the presentation of facts as fair as possible, the following table has been prepared. Again the reports are made for districts employing but one teacher. The counties are taken, without selection, from the alphabetically-arranged list, as far as complete returns have been made:

County.	Average valuation five lowest districts.	Average school population.	Average valuation five highest districts.	Average school population.
Allen.....	\$14,962	47	\$50,031	66
Anderson.....	12,938	35	45,579	59
Atchison*.....	17,796	40	90,157	56
Brown.....	24,902	43	71,507	62
Chautauqua.....	6,270	37	26,327	55
Cherokee.....	9,421	46	51,875	83
Cloud.....	11,190	40	58,511	56

* Returns not quite definite.

We cannot see the use of pursuing these comparisons further. The result is the same from Alpha to Omega, from A to Izzard! Any one can see the existing inequalities at a glance.

We venture the assertion, that if these inequalities and disabilities were political rather than educational—if they affected the political interests or prospects of parties as they do the educational of communities—there would be a redistricting or a revolution, and that before next spring.

What is a fair estimate of the annual cost of a good school? We do not mean the very best; but the least that we have a perfect right to demand and expect in every district, if our system is to be more than a farce.

Something as follows:

A good teacher six months, at \$50.....	\$300
Janitor.....	50
Fuel.....	20
Repairs, improvement of grounds, etc.....	25
Additions to library, apparatus, etc.....	30

425

We do not care to discuss this statement by even one printed line of argument. Any one whose opinion is worth anything knows that this is really a minimum, and by no means all that can be desired.

What kind of schools, then, can be expected in the five lowest districts in each county reported in the last table? Examine the following table for the answer:

County.	Average valuation 5 lowest.	Maximum levy, 20 mills, gives.	County.	Average valuation 5 lowest.	Maximum levy, 20 mills, gives.
Allen	\$14,962	\$299	Elk	\$10,026	\$200
Anderson	12,988	258	Ellsworth	9,873	197
Atchison	17,796	355	Harper	10,109	202
Brown	21,962	498	Harvey	12,048	240
Chautauqua	6,270	125	Jewell	8,481	168
Cherokee	9,421	188	Marion	11,904	238
Cloud	11,190	223	Marshall	13,148	262
Crawford	12,976	259	Mitchell	6,471	129
Dickinson	13,046	280	Nemaha	16,442	328
Doniphan	14,249	284	Pawnee	10,852	217
Edwards	5,071	101	Rush	8,537	70

That's a comfortable showing! In twenty-two counties—representative counties, selected at random—the average district of the five lowest valuations can raise, by taxing itself to the extreme legal limit, \$232, or a trifle more than half enough for a good six months' school! No wonder that the chief qualifications of some rural teachers seem to be "cypherin' and lickin'."

*Take the average of the five highest valuations (holding still to districts employing but one teacher); suppose them to tax themselves equally with the five lowest, and then compare the educational possibilities of the children of one with those enjoyed (?) by children in the other. Compare, or, better, contrast, the tables as you read.

County.	Average valuation 5 highest.	Maximum levy, 20 mills, gives.	County.	Average valuation 5 highest.	Maximum levy, 20 mills, gives.
Allen	\$50,631	\$1,000	Elk	\$47,323	\$946
Anderson	45,579	911	Ellsworth	58,402	1,168
Atchison	90,157	1,803	Harper	42,124	842
Brown	71,507	1,430	Harvey	56,937	1,138
Chautauqua	26,827	526	Jewell	27,426	548
Cherokee	51,875	1,037	Marion	45,217	904
Cloud	58,511	1,170	Marshall	40,177	803
Crawford	47,252	945	Mitchell	47,961	959
Dickinson	52,150	1,043	Nemaha	45,814	916
Doniphan	66,400	1,329	Pawnee	76,963	1,539
Edwards	47,027	940	Rush	20,370	407

This shows an average of \$1,014; or considerably more than four times the average of the five lowest. This is called equality of taxation, "equality before the law," educational equality.

In the estimate given above, \$425 was considered the minimum expense of a tolerably good six months' school. It was shown that many districts could not raise this amount under the present limitation; while some districts under a 20-mill tax could raise three or four times this amount.

Can a single valid objection be raised to spreading the aggregate running expense of all the schools of a county upon the county rolls?

The State has three objects in view in public education. It wishes to make each man an intelligent voter; it wishes to make each independent of the necessity for public aid—that is, to lift him above possible pauperdom; it wishes to make him strong enough to bear his share of all public burdens. "These are such essentials in a free republic, that we have accepted as a truism, "the State must educate or perish."

Education, then, is the public necessity, a public duty, a public burden (as far as expense goes), and a public blessing. Its methods, therefore, should be as largely public and as little communal as possible.

In this State, as in most Western States, the county is really the political unit. The desirability and justice of distributing to the county at large what had been so long carried by townships (under the rather limited New England system)—such as bridges, the care of the poor, etc.—has long been recognized. The school, which should have been

first to receive this more just as well as more generous treatment, has thus far been left to be handled in a happy-go-lucky way by the petty little communalities, which we insist on retaining for no reason other than "for the sake of self-government;" as though self-government did not exist in the county, or as though self-government were desirable for its own sake rather than for its results!

Let us suppose a county system, for taxation at least, and note the results. The task of making the necessary computations for many counties is arduous and unnecessary. One county, a thoroughly representative one, will be sufficient.

In this county we find, outside of its one city, a valuation of \$3,200,000. It has eighty-five school districts—far too many, if any reasonable amount of discretion had been used in districting the county. But we will take it as it is.

The problem then is: 85 times \$425 equals \$36,225; \$36,225 equals 11.8 mills on \$3,-200,000.

Think of it! A good six months' school in every district in the county for less than a twelve-mill tax. If any district wishes to do more, let it do so; but here is an absolute guarantee of good work throughout the county.

It seems impossible to study the figures in the foregoing tables, and the inferences drawn from the answers of superintendents, without concluding that our school system is wretchedly inefficient, and that our legislature should at once be asked to enact a law which will secure for us a juster taxation, more efficient supervision, more intelligent officers, a simpler machinery, a uniform course of study, uniform text-books, and, as a consequence of all these, infinitely better results in our schools than it is possible to expect under the present system.

Your committee therefore recommend, that all laws in relation to our independent school district system be repealed. We have carefully examined the school systems of various States, and we conclude that the model system of schools for a State, approved by the National Association of Superintendents, at Philadelphia, in 1876, and also by the veteran Commissioner of Education, General Eaton, who has given the best years of his life to a study of school systems, is the best for Kansas, and it is the system your committee now respectfully present to you. As that part of the Kansas school system which relates to higher education is in the main satisfactory, it has not been touched in this report; and all the recommendations made have reference solely to the rural parts of the State, excluding all cities of the first and second class.

In dividing the State for school purposes, we recommend—

That the county should exercise a limited general supervisory control over its schools, select a county superintendent, have a county board of education, secure uniformity in text-books, have power to establish county high schools.

That the county board of education should be composed of the school trustees of corporations which are under the supervision of the county superintendent, consider the general needs and wants of the schools under its charge, seek to unify the school work, arrange a course of study, make general rules and regulations in regard to the employment of teachers, time of commencing schools, the government of the schools and the conduct of the teachers and pupils, etc., adopt text-books, levy a county tax.

That the city or township should be left to the local control of its schools, elect its officers, build its own houses, select its own teachers from among those that have been duly qualified under the laws of the State, be permitted to levy local taxes for the building of houses, etc.; be permitted to levy local taxes for the continuance of the schools beyond the minimum period fixed by the State, be permitted to levy local taxes for the maintenance of schools of an advanced grade.

That districts should be formed for the purpose of localizing the patrons of the school; have an advisory power in the selection of teachers and the erection, removal, or repair of school-houses.

That trustees of townships and cities should be three for each corporation; be elected by the people; serve for three years, one retiring annually; receive school revenues; have power to levy local taxes, within specified limitations, for grounds, buildings, furniture, repairs, supplies, apparatus, etc., and for library purposes and for additional tuition purposes; be compelled to locate, establish, and maintain a sufficient number of schools for a certain number of months in each year; have power to abolish old school districts, create new ones, build and remove houses; be compelled to make provisions for instruction in certain prescribed branches; have power to establish township or town graded schools; have power to provide instruction in branches additional to those prescribed by law; employ and contract with teachers, being restricted in their selection to those who have been duly licensed by competent authority; properly account to proper officers for all school revenues that come into their hands; receive reports from teachers, and should transmit reports to the county superintendent and other county officers; have authority to dismiss refractory pupils from school; be prohibited from contracting debt; carry out the orders of the county board of education in respect to course of study and text-books.

We further recommend that no person shall be eligible to the office of county superintendent who does not possess a diploma from a college or university legally empowered to grant literary degrees, or a diploma or State certificate issued according to law by the authorities of a State normal school, or a certificate from the State board of education, or a first-grade certificate from a county or city examining board; nor shall he be eligible unless he has a sound moral character, and has had successful experience in teaching within three years of the time of his first election.

We further recommend that in each county the tax levied by the county board be sufficient to secure to each district in the county six months' school each year; and that the one-mill State tax be restored.

We have placed before you as concisely as possible the evils we seek to remedy; and, in like manner, recommend a system which has received the approval of the most eminent educational bodies and men in the land. We sincerely hope that the substantial outlines of the system will be adopted, and that immaterial details may not delay your action. We recommend that this report, if adopted, be printed at the expense of the association, and that a copy be sent to each member of the State legislature.

We further suggest that a committee be appointed to draught a bill embracing the system herein outlined, and to further the passage of this bill at the next session of the legislature.

Respectfully submitted,

JOHN MACDONALD.
J. H. CANFIELD.
H. D. MCCARTY.
W. H. SWEET.

The State Teachers' Association adopted the foregoing report, and added to the original committee the following gentlemen: Hon. J. H. Lawhead; Hon. H. C. Speer, Superintendent R. W. Turner, of Jewell; Superintendent J. H. Lee, of Riley; Superintendent Matt. Thomson, of Wabaunsee.

KENTUCKY.

[Report of 1884-86.]

The Kentucky report of 1884-86 shows that the condition of the public schools of that State has been one of almost uninterrupted progress, and that the prospects for continued improvement are very encouraging.

The greatest drawback arises from (1) a want of interest and appreciation, which is very decidedly marked in some counties; and (2) a lack of funds, caused in part by this want of interest and in part by the slender resources of the people. Hence proceeds the indisposition or inability in some sections to raise local revenues to supplement the State grants, which results in turn in the continued existence of poor, even wretched, school-houses and the employment of underpaid teachers. "When they [the trustees] try to employ a first-class teacher and ask the district for a tax or a subscription, they are met with the following reply from the patrons: 'I thought it was to be a free school! I paid my taxes; that is all I'm going to do. The public money pays the teacher \$20 a month; that's more than I can get working on a farm. You needn't say anything more to me. I am against the tax.' The trustee leaves in disgust; and the energetic, thorough teacher, with an ambition, is soon on his way to other more appreciative States, or to a more remunerative profession."—(Superintendent of Ballard County.)

A comparison of the county superintendents' reports for the two years covered by the State report shows the growth of a much more hopeful tone, though there is still a strong undercurrent of such complaints as the above. Particularly is this noticeable in the increased willingness to raise funds by local taxes and subscriptions. The superintendent of Boyd County says: "When the present school law took effect there were 37 districts, 4 good houses, 11 medium, and 20, if not 31, that should be condemned; 2 districts had no house at all; 14 houses were at once condemned. Eleven of these districts have voted tax to build new houses in place of condemned ones; 8 of the new houses are completed; 1 brick, worth \$800; 7 frame, average value about \$400. Three others will be built in the spring, with probable cost of \$3,500. At the end of five years from the date of the new law it is hoped and believed every district in Boyd will have a good, comfortable, healthy school house. A vote for county tax in August was defeated by only 27 votes; at another time the tax will carry." The superintendent of Lyon County: "The school houses were found to be a disgrace to civilized communities, so 18 out of 23 were condemned. The people are responding nobly, and next year, instead of houses valued at \$20, \$50, and \$75, an increase of value is confidently expected at the rate of

\$300, \$500, and \$800." Superintendent Pickett shows that the cause of education is not merely keeping pace with the general development of the State in material prosperity, but is considerably outstripping it.

A marked feature of this report, and one which distinguishes it from most Southern school reports, is the information it gives as to the condition and prospects of the colored schools and as to the sources from which they draw their revenues, showing what the white inhabitants of Kentucky are doing for the education of the negroes. This matter is treated of more in detail in Chapter XIV.

The following extracts show the superintendent's treatment of the principal topics of interest:

SCHOOL POPULATION.

	1886.	1880.	Increase.
White school population.....	524,448	478,554	45,894
Colored school population.....	99,799	66,561	33,235
Aggregated totals.....	624,247	545,118	79,129

Total increase during this period, 79,129; white, 45,894; colored, 33,235. The extraordinary relative increase of the latter over the former must be referred, mainly, to the extension of the school age, in 1882-83, to correspond with the school age of the white children. The increase of the census of white children for 1886 over that of 1885 is 9,993, while that of colored children, is only 1,905.

SCHOOL REVENUES.

The increase of the school fund, as apportioned, from 1880 to 1886, is \$399,864.33, and the increase in local taxation and subscription from 1880 to 1885 is \$205,165.75, making a grand total of \$605,030.08. Thus while the number of school children has been largely augmented, the increase of the general school fund for the same period has been correspondingly greater, producing an increase of the per capita from \$1.25 to \$1.65 for the white school children, and from \$0.48 to \$1.65 for the colored school children. Of course this is referable, first, to the additional 2-cent tax voted by the people in 1882; secondly, to the acquirement of the just proportion of the school tax from railroads, turnpike roads, banks, and other corporations; thirdly, to the increase of the taxable property of the Commonwealth; and, fourthly, to the increasing popular interest in the common schools. This speaks well for the progress and prosperity of our people. It is, in fact, the practical realization of one of the fundamental principles in political economy—the increase in the wealth of a State, intelligently directed, exceeding the ratio of the increase in population.

THE FOURTH INSTALMENT OF THE SURPLUS REVENUE.

Kentucky, with her inborn intelligence, energy, and sense of independence, and with her vast and varied material resources only needing further development, must continue to rely mainly on herself for the proper conduct and sustenance of her common schools. Every importunate effort in any other direction contributes to lessen her self-reliance and her self-respect in regard to her schools. Yet there are legitimate claims that the Commonwealth has upon the General Government, which in no sense should be ignored by your honorable body or disregarded by your obedient servant. In virtue of the large and unavailing surplus in the Treasury of the United States, the following "suggestions" were prepared and published by the superintendent for the special consideration of the last General Assembly, and as they are of equal force at present, they are duly reproduced:

"In the common school report for 1880-81, pages 218-222, the origin of the school fund is succinctly recited. It will be seen that under the Deposit Act of June 23, 1836, Kentucky received \$1,433,757.39 from the General Government, that sum constituting the three instalments. The fourth instalment, calling for \$477,919.13, has never been paid, or, in other words, has never been deposited, as the law clearly requires. According to the act of Congress the deposits were subject to call in ratable sums by the Secretary of the Treasury if wanted to meet appropriations by law. These instalments have never been called for, and no law has ever been enacted by Congress preventing the payment of the fourth instalment. It is still due, and there is a large surplus in the public treasury at Washington. That amount should be legally collected and added to the common school fund of this Commonwealth.

"Kentucky has suffered largely by the late war. According to the United States census of 1880 as compared with that of 1860, in assessed valuation of property there was

a decline in this Commonwealth of 34 per cent., or \$177,648,722. In simple terms, 'the loyal State of Kentucky' was subjected to the sacrifice of more than one-third of her property in support of the Federal Government in the late war. She has sustained this loss, while her sister States of Ohio, Indiana, and Illinois have, respectively, enjoyed for the same period an increase of 60 per cent., 77 per cent., and 102 per cent. in assessed valuation of property.

"In common with all the late slave States, Kentucky has not only suffered from the deprivation and depreciation of property, but has had imposed upon her a mass of illiterate freedmen, whose descendants must be educated for citizenship, and as 'mixed schools' will not be tolerated in the South, a dual system is a necessity in every Southern State, thus imposing an extraordinary burden in the way of additional taxation upon the white citizens. In Kentucky, for the school year ending June 30, 1883, they apportioned for the support of colored teachers \$92,845.36, while the colored people contributed only \$16,661.19, the entire revenue derived from them. This is not stated in reproach to the colored people, but simply in justice to the white tax-payers.

"It is not the province of the superintendent to say what other Southern States should do, but in regard to Kentucky, and in virtue of the foregoing statement, he respectfully suggests the following:

"*First.* That, inasmuch as there is a large surplus revenue reported to be in the United States Treasury, which is not needed for the ordinary expenses of the Government and is not demanded for the payment of any portion of its debts, and inasmuch as 'the fourth instalment' has not been paid to Kentucky for common school purposes, the General Assembly take such steps as may be necessary for the proper consideration of the matter. It should be added that Virginia and other States are moving in the same direction.

"*Second.* In consideration of the facts stated above, and that Kentucky has annually and largely contributed to the creation of the surplus revenue in the Federal Treasury by the regular payment of taxes thereto, she is in a position to expect, as a moral and political obligation, her legitimate quota of such surplus, independently of all form of subsidy or of compromise of her inherent rights as a State.

"*Third.* Creation involves the obligation of legitimate preservation. Inasmuch as a large additional citizenship, with equal political rights and privileges, but of unequal material, had been created in Kentucky by the power of the Federal Government, and in view of all the facts given, the superintendent suggests that such steps shall be taken as shall lay before said Government that which is due, both to the white and the colored citizens of the Commonwealth, in regard to the necessities of the common school system of Kentucky.

"Attention is invited to the following compendium from the United States census of 1880 in regard to Kentucky:

White males of 21 years of age and upward.....	317,579
Returned as unable to write.....	54,956
Percentage.....	17.3
Colored males of 21 years of age and upward.....	53,642
Returned as unable to write.....	43,177
Percentage.....	73.6
Total number of males of 21 years of age and upward.....	376,221
Total number who can not write.....	98,133
Percentage.....	26.0

In response to the proposition concerning the "fourth instalment" indicated above, the honorable joint committee on education favored the "suggestion;" the superintendent accordingly drew up a bill covering the whole ground, which duly became an act of the General Assembly, approved April 12, 1884.

In accordance with the second "suggestion," a bill, drawn also by the superintendent, guarding the character and credit of the Commonwealth in the event of national aid to common schools, was introduced in the senate, and finally, by executive approval, became a law on the 12th of May, 1884.

No special action was directly taken in regard to the third "suggestion;" but as Kentucky was always rated and ranked as "a loyal State" by the General Government, and in view of her heavy loss in property, her slaves alone being assessed in 1860 by the proper State officers at \$103,876,402, and that she is maintaining, as already shown, at the expense of her white schools a system of common schools for the very descendants of those slaves, the superintendent hereby "suggests," as a matter of law and as a measure of relief, that these facts be duly represented to the General Government. A low rate of interest on one-tenth of the value of the emancipated slaves of the "loyal citizens" of the State would, with the present census of pupil children, maintain the system of colored schools, with a fair appropriation for the building of school-houses. The State would compensate for the increase of the school census. This plan is entirely practicable by the execution of a bond by the General Government in favor of the Commonwealth, draw-

ing interest, without invading the principal, at 4 per cent. per annum until the system becomes at least measurably and by degrees self-sustaining.

NEW LEGISLATION.

Night schools.—The following act was approved February 26, 1886:

Whereas, the management of the night schools in the city of Louisville by the board of trustees of the public schools of said city has developed the fact that a large number of the applicants for admission are by laboring people of both sexes who are unable to read and write, have to be excluded under the present law because over the school age; and whereas such people, ignorant from misfortune, poverty, or lack of opportunity, are children in knowledge, and manifest a laudable ambition in seeking knowledge to overcome their ignorance and become better citizens by studying and attending school at night after their toil of the day; and whereas it is manifestly to the interest of the public at large that every person know how to read and write, without which knowledge they can not properly or fully discharge the duties of citizenship under a free and enlightened Government: *Therefore * * ** the board of trustees of the public schools of any city in this Commonwealth, having a population of 20,000 or over, are hereby authorized and empowered to admit as pupils in the night schools under their direction and control such persons over the pupil age now prescribed by law and under the age of 40 years, at their discretion, and under such rules, regulations, and restrictions as the said board of trustees provide, not inconsistent with the laws of the Commonwealth: *Provided*, That on no account shall the pupils admitted to said school by virtue of this act be enumerated as pupils under the common school law of the State.

Payment of teachers' wages.—For the purpose of providing for the monthly payment of the wages of the teachers of the common schools, the superintendent of common schools in any county is hereby authorized to borrow for said purpose, at a rate of interest not exceeding 6 per cent. per annum, a sufficient sum of money duly estimated from the apportionment table furnished by the superintendent of public instruction.

Substitution of district for county taxation.—County taxation has been repealed and district taxation substituted as follows: A tax may be voted at any time, once a year, or for three successive years, after notices have been duly posted, for the better payment of teachers, for the extension of the district school for a longer term, or for the payment of any debt contracted by the trustees on account of the common school. The tax shall not exceed twenty-five cents in any one year on the hundred dollars' worth of taxable property in the district.

School-house sites.—A site for a school-house may be purchased, a school-house built, repaired, or furnished, without submission of the question to a vote.

Adoption of text-books.—Instead of trustees adopting text-books, from lists recommended by the State board of education, to be used in their respective districts, the county superintendent shall adopt from said lists text-books to be used in their respective counties.

Text-books for indigent children.—The county judge of any county is authorized to make an allowance out of the county levy, not to exceed \$100 in any one year, for providing necessary text-books to indigent children, provided they attend the public school.

State teachers' institutes appropriations.—Five hundred dollars shall be appropriated annually by the State for the benefit of the State teachers' institutes.

Duty of superintendent of public instruction.—It shall be the duty of the superintendent of public instruction, whenever it shall come to his knowledge, to report any habitual neglect of duty or any misappropriation of common school funds on the part of any of the county superintendents or trustees of common schools of this Commonwealth to the county attorney, whose duty it shall be to prosecute such person in the circuit court of the county in which such neglect of duty or such misappropriation of funds may occur.

Age of eligibility for county superintendent.—No person shall be eligible to the office of county superintendent who is not at the time twenty-one years old.

Terms of office of county superintendents.—County superintendents shall hold their offices for four years, or until their successors are elected and qualified.

Eligibility to office of county superintendent dependent on certificate of qualification.—No person shall be eligible to the office of county superintendent unless he shall have first obtained a certificate of qualification from the State board of examiners, which may be granted on an examination held before them or upon a written examination held before the county judge, the county attorney, the county clerk, and a competent person selected by them. The result of said written examination to be forwarded to the State board of examiners, who may, if they deem it sufficient, grant a certificate, and, if they refuse it, shall notify the aforesaid county board, and no certificate can then be granted the said applicant for the election then pending. The State board of education shall designate to the county board the character of examination required.

Report of county superintendents.—Under penalty of a fine from twenty to fifty dollars, county superintendents are required to report for payment, at the legal periods, schools duly taught.

Buying of teachers' claims, etc., prohibited.—No county superintendent shall be allowed to buy for himself or another any teacher's claim, directly or indirectly, or to act as agent for the sale of any books, under the penalty of removal from office by the superintendent of public instruction.

Certificates.—No certificate, except first class and second class, shall be issued to the same person more than twice.

Recommendation of normal instructors.—The superintendent of public instruction may recommend able and experienced normal instructors to conduct the county teachers' institutes.

Taxes.—No tax shall be levied upon the property or poll, or any services required of any white person for the benefit of a school for colored children, and no tax shall be levied upon the property or poll, or any services required of any colored person for the benefit of a school for white children.

LOUISIANA.

For statistical and other information concerning education in Louisiana contained in this Report consult the Index.

MAINE.

[From Report for 1886-87 of State Superintendent N. A. Luce.]

There was a slight decrease in the number of schools, but the number of pupils was larger than in the previous year; the school term was longer, being on an average twenty-two weeks and two days—an increase of one week and three days—and there was a larger proportion of experienced teachers and of those who had enjoyed the regular and systematic training of the Normal School. It is a legitimate inference, therefore, that more thorough, effective, and successful work was accomplished, and that greater progress was made by the pupils.

SCHOOL DISTRICT SYSTEM.

There was an increase of nine in the number of towns having the town system of managing the schools, causing a reduction of 89 in the number of school districts and of 26 in the number of parts of districts. This was a decided improvement, if we are to judge by the language of Superintendent Luce: "Not till we are rid of that iniquitous product of educational folly and democracy run mad—the school district system—can all of our schools be brought up to full efficiency in the annual amount of schooling which they should offer to every child in the State."

TEMPERANCE INSTRUCTION.

The law enacted by the Legislature in 1885 requires that "all pupils in all schools supported by public money or under State control" shall be instructed in "physiology and hygiene, with special reference to the effects of alcoholic drinks, stimulants, and narcotics upon the human system;" and that no certificate shall be granted to any person who has not "passed a satisfactory examination in physiology and hygiene, with special reference to the effects of alcoholic drinks, stimulants, and narcotics upon the human system." This law has been in force two years. There were some serious difficulties encountered in its introduction. There were a great many young pupils who could not read and could understand only the simplest statements. Such instruction could only be given them *directly* by the teacher—*by word of mouth*. This was a method of teaching with which many of the teachers were utterly unacquainted.

A second difficulty was that, although text-books on physiology and hygiene were used in many schools, few of them directed special attention to the effects of alcoholic drinks, stimulants, and narcotics upon the human system. Consequently, new text-books had to be introduced.

As was to be expected, many parents were opposed to such instruction for different reasons, and the more so when asked to supply their children with books on the subject, which they frequently refused to do.

Notwithstanding these difficulties, however, the law was very generally complied with, so that such instruction was given to nearly all the pupils—probably to between 80 and 90 per cent. of them.

Superintendent Luce claims that as the end of such instruction is to give the child such a knowledge of the evil effects of stimulants and narcotics upon the human system as to forever deter him from intemperate habits, any other means which will assist in this purpose should be adopted. Hence, the child should also be instructed as to the moral, social, and financial evils resulting from habits of intemperance. He should be taught how large a part of the crimes, poverty, and disease results from intemperance.

COMPULSORY ATTENDANCE.

The first law for compulsory school attendance was enacted in 1875, but it was found impossible to enforce it. Another was enacted by the Legislature in 1887, requiring all children between 8 and 15 years of age to attend school for at least 16 weeks in each year; but, as it has been in effect only a few months, it can not be stated definitely as yet what will be its effect. It is very probable that it will secure a much larger school attendance, especially if the law is rigidly enforced for the first year or two, after which it can be easily enforced.

COURSES OF STUDY FOR UNGRADED SCHOOLS.

Superintendent Luce recommends the establishment of regular courses of study for ungraded schools and that when pupils have completed this course they be graduated, just as in graded schools. It would afford a strong incentive to diligent and accurate study on the part of pupils, and furnish them with a definite and well-marked standard or degree of education to which all pupils would aspire and which their parents would desire them to reach before finally quitting school.

RECOMMENDATIONS.

Superintendent Luce recommends—

- (1) That school committees and supervisors earnestly endeavor to increase school attendance, especially by a rigid enforcement of the new compulsory law.
- (2) That they endeavor to secure teachers of high attainments and skill, and to retain teachers who have given satisfaction.
- (3) That they introduce regular courses of study in ungraded schools.
- (4) That they endeavor to abolish the district system, to secure the adoption of the free text-book plan, and the establishment of free high schools.
- (5) That they encourage educational meetings.
- (6) That they encourage young teachers of promise to attend a normal school.
- (7) That they endeavor in every way to elevate the public school system.

MARYLAND.

[From Report of State Board of Education for 1886-87, Hon. M. A. Newell, Secretary.]

The number of pupils enrolled in the county schools, 1886-87, was 121,177, as against 123,423 two years previously. Considering the natural increase of population, the falling off of more than 2,000 pupils in two years is a matter calculated to excite inquiry. It is true that this decrease is to a certain extent compensated by the fact that the average daily attendance has increased 2,821 during the same period.

Extending the comparison over a greater interval of time, the changes in the public school system can be more clearly discerned. In 1867 the average duration of the school was 9 months. In 1887 it 3½ months. In 1867 13 counties kept schools open 10 months in the year; in 1887 only 10 counties had schools open for a similar period. This apparent retrogression may be explained by the fact that in 1867 the white schools received \$359,226 from the State (being \$293,550 from the State school tax and \$62,676 from the free school fund), and in 1887 they received only \$309,846 from the State (being \$267,522 from the State school tax and \$42,324 from the free school fund). This loss of \$50,000 could have been easily met if the conditions had remained permanent. But with the gradual diminution of income from the State there came a gradual increase of necessary expenses, owing to the natural increase of population and the growing popularity of the public schools.

The number of white children enrolled in the county schools in 1867 was 71,060; in 1887 it was 95,331. In 1867 the average annual salary of a white teacher was \$316. In 1887 it was not quite \$300. In order to make a just comparison it has been necessary to limit the inquiry to white schools, because the colored schools had no aid from the State till the year 1872. In truth, the embarrassments of the white schools sprang indirectly from the establishment of the colored schools.

In 1872 the General Assembly appropriated the *entire proceeds of the State school tax* (\$525,000, more or less) to the support of the white schools, and \$50,000 additional to the colored schools. In 1874 the General Assembly appropriated "whatever sum may be paid into the treasury on account of the levy of the public school tax" to the white schools, and to the colored schools \$100,000. There was no interference with the law

and the custom of devoting the whole income of the State school tax to the white schools until the year 1878, when the General Assembly passed an Act requiring the amount set apart for colored schools, the appropriation to the State normal school, and the expenses of the State board of education, amounting in all to \$111,500, to be paid out of the annual proceeds of the State school tax.

The counties, with some exceptions, have done their best to make up the deficiency from this diversion of the State school tax, the county school tax having risen from \$335,371 in 1873 to \$457,802 in 1887. But there are indications that the limit, whether of ability or of inclination we need not inquire, has been nearly reached. The school year is growing shorter; the teacher's salary is growing smaller, and the necessary result will be a corresponding deterioration of the public schools. All that is needed is to go back to the condition of things in 1877, devote the whole proceeds of the State school tax to the white schools, and give from the general treasury the same proportion per capita for the support of colored schools. The \$100,000 now given by law to the colored schools is very nearly the proportion of the State school tax and the free school fund to which they would be entitled by a per capita distribution.

RECOMMENDATIONS FOR NEW LEGISLATION.

The following suggestions for the improvement of the schools and the advancement of education are made to the Legislature by Superintendent Newell:

1st. Necessary text-books for use in the school room should be supplied without charge.

2d. The State school tax should be 12 cents on the \$100, and the minimum county tax should be less.

3d. The State tax should be distributed to the several counties in proportion to the average enrolment of the pupils, white and colored, no pupil to be counted who has not made an attendance of at least 60 days (or 120 half days) in the year.

4th. The few remaining county academies should be made a part of the public school system.

5th. There should be but one school district trustee, in place of three under the present law.

6th. Every principal of a public school should be required to make a report at least twice a month, by postal card to the examiner, of the condition of his school as regards attendance, etc.

7th. Legal provision should be made for ascertaining accurately once in every two years, in the city of Baltimore and the several counties, the number of children of school-going age (say over six years and under sixteen), the number attending public schools, and the number attending private and denominational schools.

TEMPERANCE INSTRUCTION.

The General Assembly of Maryland at its last session enacted a law "to provide for teaching the study of physiology and hygiene, with special instructions as to the nature and effect of alcoholic drinks, stimulants, and narcotics upon the human system, in the public schools of the State and educational institutions receiving aid from the State," and inquiries have been made as to whether the law has been complied with. Early in the school year 1886-87 the State board of education revised the uniform course of instruction for use in the several county schools, and inserted physiology among the studies of the fifth and sixth grades of the district schools, and the seventh and eighth grades of the high schools. The result has been that while the number of pupils in the county schools studying physiology was reported in 1885 as 110, it rose in 1887 to 10,200. At the last annual meeting of the Association of Public School Commissioners this subject was discussed earnestly and intelligently. It was admitted that the full number of pupils contemplated in the law had not yet been reached, but an obstacle was mentioned which had not occurred to those who framed the law. In the majority of counties parents buy the books which their children need. They have thus an effective veto upon the teacher's wish to form classes in any study. In point of fact many parents refused to purchase the necessary text-books of physiology; but the teachers in these cases made such compensation as was possible by reading to the school from the text-book and giving the needed explanations and questions. It is hoped that the next annual report will show a decided increase in the number of pupils studying physiology; but the friends of temperance must bear in mind that more is needed than scientific instruction; the conscience must be enlightened and the will strengthened, and for these purposes other forces than legislative enactments must be brought into action. Let us hope that the beginning now made may be like the path of the just, "a shining light that shineth more and more unto the perfect day."

MASSACHUSETTS.

[From Report for 1886-87 of Hon. John W. Dickinson, Secretary of State Board of Education.]

There has been a gratifyingly large increase (993) in the number of pupils over 15 years of age. On the other hand, the number of very young pupils continues to diminish, 58 less being returned as under 5 years of age. The returns also show a decrease in the number of pupils intrusted to each teacher. This is a change in the right direction. The law now authorizes 50. This is an excessive number for one teacher to control and teach, but the agents of the board find many primary schools containing a larger number, sometimes as many as 70 or 80 little ones being crowded into a single room and in the care of a single teacher. Such schools can not be good schools. It is gratifying to know that the school authorities are convinced of this fact, and by multiplying the schools are making the conditions for work more favorable.

While the whole number of teachers employed has increased the number of men reported as teaching has slightly diminished. The average monthly wages of the men has increased \$5.62. These facts taken together seem to show that the decrease has been in the number of cheap male teachers. Last year several men were found keeping school for \$22 a month. The more rapidly the number of such is diminished the better will be the schools.

The high schools continue to prosper. The number of these schools is 229, an increase of 5; the number of teachers 701, an increase of 24; the number of students 22,406, an increase of 1,036. Of these 229 schools 42 are kept by towns which are not required by law to keep them. The marked growth of this grade of schools is doubtless due in a large measure to the continued influence of the free text-book law. The sum expended for sundries, including text-books and supplies, has decreased \$63,513.15. This was to be expected, as the first cost of supplying the schools under the new law was necessarily larger than the average would prove to be. The towns are now approaching the average expenditure for this purpose. This is undoubtedly much smaller than the expenditure under the old system.

The returns of private schools are defective. The whole number of pupils in such schools during the past year is reported to be 28,941. From official sources it is known that there were 30,000 pupils in schools maintained by the Catholic Church alone.

A detailed course of study for ungraded schools has been prepared, which is designed to aid the school boards of towns in preparing courses for their own schools.

ILLITERACY.

The State decennial census, taken in 1885, has disclosed the gratifying fact that illiteracy has not increased at so great a rate as the population during the last decade, and consequently is not so prevalent as it was ten years ago. This is true both for the native and foreign born population. In 1885 there were 122,263 illiterates, forming 7.73 per cent. of the population. Of these 122,263 illiterates of all degrees, 6.79 per cent. were born in Massachusetts, 4.53 per cent. in other States, while 88.63 per cent. were foreign born. The native born illiterates were, in 1875 and 1885, 1.33 and 1.29 per cent. of the total population, respectively, while the foreign born were 23.12 and 21.50 per cent. for the same periods.

The above figures include illiterates of all ages, many of whom have come into the State after reaching maturity, and are therefore beyond the reach of elementary instruction. If only the minors from 10 to 20 are taken into consideration they will be found to be only 9.92 per cent. of the total number illiterates, as against 11.09 in 1875.

For other information concerning education in Massachusetts consult the Index.

MICHIGAN.

NEW LEGISLATION—SESSION OF 1887.

Temperance instruction.—The law relating to instruction in physiology and hygiene was amended as follows: (1) Such instruction must be given by text-books in the case of pupils who are able to read and as thoroughly as in other studies pursued in the same school; the text-books to be used for such instruction shall give at least one-fourth of their space to alcoholic drinks and narcotics, and at least 20 pages in the highest grade. (2) Text-books used must be approved by the State board of education, the approval of the board of health no longer being necessary. (3) Each teacher of a public school must certify whether or not such instruction has been given in the school presided over by him or her. (4) School boards are subject to fine or forfeiture for neglecting to carry

out the provisions of this act. (5) This act applies to all schools in the State, whether incorporated under special charter or general laws.

Reports of township inspectors.—Reports of township inspectors are hereafter to be made to the county board of school examiners, instead of to the county clerk.

School libraries.—The provision authorizing the voters of a township at their annual meeting to apply any part of the township tax to the purchase of books for a school library, has been stricken out.

Examination of teachers.—(1) The board of school examiners of a county is to consist of two members elected by the chairmen of the township boards of inspectors, and of a secretary, who is to be *ex-officio* a member, elected by these two, acting with the county judge of probate. (2) The secretary is to hold two regular, and not more than six special, examinations annually; first and second grade certificates shall be granted only at the regular examinations. (3) In addition to the requirements heretofore in force, candidates for teachers must have attained the age of sixteen years. (4) Certificates of the first grade are made valid throughout the State; no special certificate shall be granted to a person who at any previous examination has failed to secure a regular certificate; holders of special certificates who have failed to present themselves for examination shall not have their certificates renewed.

Supervision of schools.—The secretary of the county board of school examiners, in addition to the duties heretofore prescribed, shall (1) visit, or cause his assistants to visit, each school in the county at least once a year; (2) counsel with teachers and school boards as to the courses of study and discipline; (3) make suggestions with regard to school buildings and grounds, heating, ventilation, etc.; (4) promote the improvement of schools, and the elevation of the characters and qualifications of teachers and officers; and (5) receive the reports of the township inspectors. Duties (2), (3), and (4) formerly devolved upon the chairman of the township inspectors; and (5) upon the county clerk. The provision authorizing county boards of examiners to hold special meetings to suspend or revoke the certificates of teachers is withdrawn.

The compensation of the secretary of the county board of examiners shall not exceed \$300 in counties having 30 districts or less, or \$10 a district in counties having over 30 districts, in no case to exceed \$1,500 per annum; he shall not receive any compensation until his reports, required by law, have been made and filed.

Crime and truancy.—Any girl from ten to seventeen years, a boy from ten to sixteen, who shall wilfully absent himself or herself from school or legitimate employment, or frequent a place where intoxicating liquors are kept for sale, or lounge upon the streets against the command of parents, or attend a dance, skating rink or show without the consent of parents, shall be deemed a truant and disorderly person. Any such minor, upon conviction, may be sentenced to a reformatory institution, provided the circuit judge or probate judge of the county has first approved the sentence.

[From Report for 1885-86, Theodore Nelson, State superintendent.]

TOWNSHIP SCHOOL DISTRICTS.

"During my brief connection with this department I have become convinced that there exist two radical defects in our present school system, *i. e.*, imperfect supervision and too many school districts. These defects have been noted and discussed at length by several of my predecessors, and I am simply falling into line with their views in urging the necessity of some change in these particulars. The argument in favor of consolidating the common school districts in each township is exhaustively presented by Hon. H. R. Gass, in the annual report of this department for 1883, and I shall only attempt to emphasize some of the facts presented in support of his advocacy of the proposed change.

"The inequality of the cost per capita for instruction incident to the present system is shown in the reports of the township inspectors on file in this office. The following cases are taken at random from the different counties in the State, and are not exceptional."

Superintendent Nelson then instances a number of cases to show this inequality in the cost per capita for instruction, in some districts it being six times as much as in others in the same county. He then goes on to say:

"Instances of a similar character could be cited from nearly every county in the State. Assuming that the districts reporting the least enrolment are the more sparsely settled and the less able to bear the burden of taxation necessary to support the schools, and adding to the cost of instruction the current expenses of the school, cost of buildings, etc., the inequality is most marked.

"While the inequality would not be entirely done away with in each instance by placing all the schools of the township under one management, the evil would be lessened very materially, and the school taxes would be equitably distributed over all the

territory comprised in the township. Nor is this all. The wages of all the teachers in the township would be more equally adjusted, resulting in supplying the same grade of instructors to all sections of the township.

"The adoption of the township district would naturally result in a uniform series of text-books for all the schools of the township. The advantages that would accrue from greater uniformity are self-evident, the only question being to what extent is uniformity desirable? Should it be confined to the district, the township, the county, or should it include the entire State? While I am not favorable to State uniformity and am somewhat in doubt as to the advisability of a county uniformity even, I am satisfied that a uniform series of text-books for all the schools of a township would be of great benefit to the district schools, and would simplify the adoption of county uniformity should it be deemed advisable."

STATUS OF TEMPERANCE INSTRUCTION.

"What is the exact *status* of temperance teaching in our public schools? The question is raised because it has been a matter of some inquiry, as well as controversy.

"While the duty to provide for special instruction in physiology is made mandatory upon all district boards, there is no special penalty provided for failure to comply with the law. With a view to ascertain to what extent the law was complied with, special efforts were made during the past year to secure reliable information upon this point. The returns from the graded schools are quite complete, but the reports from the district schools are not as satisfactory. The blanks furnished the school directors of the State by this department included the following query: 'Is physiology and hygiene taught in your school as provided in section 15, chapter 3, General School Laws of 1885?' Of the 6,897 districts in the State 2,313 answered 'Yes,' 1,789 answered 'No,' and 2,795 made no report. Among the latter are undoubtedly a number of districts in which the subject is taught, but it is, of course, impossible to form any reliable estimate of the number. The fact that more than 1,700 districts report that the subject is not taught indicate a very general disposition on the part of district officers to either ignore the provisions of law, or to deliberately disregard them. The fact that they reply to the query at all is evidence that they are not ignorant of their duties in this regard. To secure a general compliance with this requirement it is evident that a specific penalty should be imposed for non-compliance.

"The reports from the graded schools are much more complete and satisfactory. The blanks for special reports of graded schools included this question: 'In what grades is physiology and hygiene taught with special reference to the effects of alcohol, etc.?' Reports were received from 248 schools, of which all but 25 included replies to the above question. Seventy-eight report the subject taught in all the grades; 39 report it taught in the grammar and high school grades; 7 in the primary and grammar grades; 2 in the primary and high school departments; 12 in the grammar grade only; 82 in the high school only; 1 in the primary grade only, and 1 reported the subject not taught.

"These statistics show that the subject is taught in over 33 per cent. of all the schools of the State. While this showing is far from meeting the expectations of the friends of the law, some encouragement can be derived from the fact that the report for the school year ending September 3, 1883, the year before the statute above quoted went into effect, showed that only 653 districts out of 6,336 included physiology in their course of study. In four years this law has resulted in increasing the number of schools affording instruction in this important branch of study from 10 per cent. to 33 per cent."

For other information concerning education in Michigan consult the Index.

MINNESOTA.

NEW LEGISLATION.

Investment of State school funds.—A constitutional provision, adopted November 2, 1886, provides that the permanent school funds of the State may be loaned upon interest at the rate of 5 per cent. per annum to the several counties or school districts of the State, to be used in the erection of county or school buildings. No such loan shall be for an amount exceeding 3 per cent. of the last preceding assessed valuation of the real estate of the county or school district receiving the same. The State auditor shall annually certify to the county auditors the taxes necessary to be levied to meet the accruing interest and principal of such loans, adding 50 per cent. thereto; any excess collected shall be credited to the general funds of the respective counties or school districts.

School month; legal holidays.—In every contract between any teacher and board of trustees, or board of education, a school month shall be construed and taken to be 20 days or 4 weeks of 5 school days each. And no teacher shall be required to teach

school on Christmas Day, the First day of January, the Fourth of July, Memorial Day, or the day appointed by the President of the United States or the Governor of the State as a day of thanksgiving. And no deduction from the teacher's time or wages shall be made by reason of the fact that a school day happens to be one of the days referred to in this section. And any contract made in violation of this section shall have no force or effect as against the teacher.

Attendance.—In reckoning attendance all scholars enrolled shall be credited upon the days named in the preceding paragraph whenever they occur within the school term, the same as if school had been held and all had been present.

Office of State superintendent.—The superintendent of public instruction is allowed \$1,600 per annum for clerical assistance.

Teachers' institutes.—The sum of \$1,000, in addition to the sum now allowed by law, \$6,000, is to be annually appropriated for defraying the current expenses of State teachers' institutes, and for institutes of instruction in normal methods in the elementary departments of graded schools.

Minimum school age.—Children under 6 years of age may be excluded from the public school of a district by a vote of the board of trustees.

Apportionment of funds.—The State school funds shall be apportioned semi-annually in proportion to the number of scholars between the ages of 5 and 21 years, who have been enrolled and have been in attendance 40 days in the public schools, that have had at least 5 months of term within the year by a qualified teacher.

Length of school.—The minimum length of school of independent school districts has been lengthened from 12 to 20 weeks.

High schools.—The annual appropriation for State high schools is increased from \$23,000 to \$25,000.

Normal schools.—The annual appropriations for the State normal schools at Mankato and Saint Cloud are increased from \$15,000 to \$16,000, and a standing appropriation of \$5,000 made for that at Moorhead.

Temperance instruction.—It is made the duty of boards of education and trustees to provide for, and of teachers to give, systematic and regular instruction in physiology and hygiene, including special reference to the effects of stimulants and narcotics upon the human system. Any neglect of a teacher to give such instruction shall be considered sufficient cause for annulling his or her certificate. Teachers' certificates will, after January 1, 1888, be granted only to such persons as have passed a satisfactory examination in the above branches. Provision is made for withholding a part of its apportionment of the State school fund from any district where no arrangement has been made for such instruction. The superintendent of public instruction and the presidents of the normal schools are directed to recommend some suitable text-book.

School library list.—The superintendent of public instruction and the presidents of the normal schools of this State are directed to prepare a list of books, to be amended from time to time, suitable for school libraries, to include books of reference, history, biography, literature, political economy, agriculture, travel, and natural science; they shall advertise in at least two leading papers for the lowest rates at which sellers will fill orders of school districts for books selected from this list, and make contracts accordingly with the lowest responsible bidder for a period not to exceed two years.

Districts which have purchased books under these contracts are entitled, under certain limitations, to receive from the State one-half the sum so expended. An amount not exceeding \$10,000 is annually appropriated by the State for this purpose.

MISSISSIPPI.

[From Report of State Superintendent J. R. Preston, 1885 and 1886-87.]

DEFECTS HERETOFORE EXISTING IN THE SCHOOL SYSTEM.

The school system of Mississippi during the past fifteen years has been undergoing the phases of development incident to every enterprise requiring complicated machinery and involving important and often antagonistic interests.

Peculiar difficulties were encountered at the outset, chief among which were those arising from the dual character of the population, the larger portion of which were wholly illiterate and in the main non-tax-payers. It was not to be expected that a system of such magnitude could be perfected in fifteen years, or that laws could be enacted to operate unerringly in the solution of such a complex problem; hence, efforts to establish a system of free schools have been chiefly tentative and experimental, and they must so continue for many years to come.

From the stand-point of its development up to 1886 it was patent to all who had given the subject even casual consideration that the schools were not educating the children, and experiments showed conclusively that a revision of the law was needed to remove the causes of failure. These defects had been pointed out from time to time by previous superintendents, and may be stated as follows: (1) A want of qualified teachers; (2) too many schools; (3) no supervision and inspection of the teaching force; (4) a waste of the school fund by dividing the term into sessions of two months each.

Lack of qualified teachers.—When free schools were established the vital question was, how to get teachers of any kind. There were few qualified teachers among the whites, and to import aliens was a policy at once repugnant and injudicious. A supply of qualified teachers has been the prime need from the beginning, and the lack of them is the one great evil which has obstructed progress. A license to teach was within the reach of any tyro who could call to his assistance enough personal influence to induce a kind-hearted superintendent to waive an examination on the ground that the applicant needed the place and was represented as suited to the community where he proposed to teach. In some counties, it is true, where superintendents were bold enough to brave unpopularity and were animated by a determination to force poor teachers from the field, there were examinations, and in these counties the schools advanced constantly in efficient work; but the examinations were highly unpopular, as they always will be if left to the judgment of those who are not qualified to pass them.

Want of money to sustain the schools has done far less injury to the cause of education than this neglect to establish and enforce a uniform test of scholarship—a test which would insure competency by stimulating teachers to improve in knowledge year by year. The want of competent teachers has made the system weakest where it should be strongest.

Too many schools.—The location of schools under laws prior to 1886 was placed in the hands of supervisors. The law required the schools to be 3 miles apart, but with an exception providing for the pay of teachers in small schools which had located on account of impassable obstructions. The distance apart was generally disregarded, and the exception came to be the rule. By this means schools were located at the instance of every neighborhood faction. The education of the children was overlooked in the zeal to get a school located for a particular teacher, who resided in the neighborhood and needed a support. Indigence was the leading argument in favor of such applicants.

Counties were thus overburdened with little schools, where emulation among pupils was impossible, and where the pay was too small to employ proficient teachers.

This was a process of continual disintegration and too many schools was the result. The school fund was not equal to the demands made upon it, and local relief bills were passed to levy additional tax to make up the deficit.

Want of supervision.—When the people of the State wrested the government from the sway of aliens, the office of county superintendent had been debased in many instances by maladministration, and was virtually abolished, being changed into a mere clerkship and the salary reduced to a sum which was a meagre compensation even for that. The State was yearly spending three-quarters of a million of dollars, with no agents to see how it was spent, or whether the children were receiving an education.

Waste of the school fund by dividing the session.—It had become a practice in many portions of the State to divide the term into two sessions. This had its origin in the claim that in an agricultural country the children could not be spared from work for four successive months. The claim when made means simply this: That the people must make slaves of their children; that they must rob them of the opportunity to become intelligent citizens; that parents must have the labor, and neglect the education of their own offspring.

The people have not realized the significance of this evil, which, while it may give more labor, at the same time inevitably deprives of all education. The child who has toiled for his parent during eight months of the year can not be denied the right of securing during the other four months all the advantages which the State has provided for his education. •

LEGISLATION OF 1886.

The Legislature of 1886 sought to correct these evils by a revision of the school law, as follows:

(1) *Examination and pay of teachers.*—They provided for uniform examinations to test the scholarship of applicants to teach, and to classify those applicants so that they could be paid according to their qualifications, county superintendents being required to fix the salary of each teacher, with due regard not only to his scholarship, but also to his executive ability and the scholastic population of the district in which he was to teach. They established monthly institutes to improve the qualifications of teachers by disseminating among all the experience of the best.

(2) *New system of districts.*—They provided a system of districts to limit the number of schools and to make each school large enough to justify the employment of a competent teacher.

(3) *Supervision of teachers.*—They required the superintendent to inspect the work of the teachers and to see that it was properly done, and also to organize and manage the institutes for the advancement of teachers in the best methods of instruction and discipline.

(4) *Continuous school sessions.*—They required continuous sessions, so that the school fund might not be frittered away in worse than useless schools of only two months' duration, and provided that all schools of a term should be in session at the same time, so that the work of supervision and institutes might be systematic and effective.

(5) *Pay of teachers.*—The salary system based on the per diem average attendance had been a fruitful source of unjust discriminations and of many frauds. It was abolished and the pay for teachers of the different grades was fixed between a maximum and a minimum limit.

That these heroic remedies have created commotion and aroused opposition, says Superintendent Preston, is not to be wondered at when we take into consideration the number of barnacles that had to be shaken off when the work of repair and renovation was begun.¹

EXPENDITURE MADE COMPARED WITH RESULTS ACHIEVED.

That the State of Mississippi, in the last decade and a half, has spent on free schools nearly \$15,000,000—a sum almost equal to one-eighth of the entire assessable property—is a fact not calculated to inspire enthusiastic confidence in popular education, when it is viewed in contrast with the meagre advance made in educating those who have entered life and taken the obligation of citizenship since the State assumed control of the schools. The money has been spent, and it must be conceded by any fair-minded man that it has been largely squandered, producing inadequate results, doled out month by month to indigent and incompetent school-keepers, who were placed in charge of most sacred interests of the Commonwealth, in many instances without even the semblance of a test as to their capacity and fitness for the vital trusts confided to their care.

The most earnest advocate of popular education must stand appalled as he compares these vast expenditures with the scanty results; and the time is at hand when this comparison must be instituted.

NEED OF TRAINED TEACHERS.

Superintendent Preston utters it as his most positive conviction that the greatest need of the system to-day is a corps of trained teachers. The State has squandered enough money in the last decade on worthless incompetents to train twice the number needed to do the whole work. Many of the leading, progressive teachers, it is true, are equal in ability, enterprise, originality, and power to those of any State. But they alone can not carry the dead weight of the laggards, or relieve the teaching force of the truthfulness of the strictures that have been made upon it.

ECONOMIC ADVANTAGES OF THE NEW SYSTEM.

The average term was 78 days in 1885 and 84 days in 1887. This shows an increase in time of nearly 8 per cent. If the schools had continued as long in 1885 as in 1887, they would have cost \$905,451, nearly \$64,000 more than they cost in 1887. An increase of 6 days at the same cost, or a gain of \$65,000 for the same time, is the true economic advantage of conducting our schools under the law of 1886. Taking into consideration that these results were produced in the first year's trial of the law, it is but reasonable to expect that, when teachers are more carefully graded and their salaries scaled according to the provisions of the law, the school term can be still further lengthened and the total cost reduced.

The total receipts reported for the scholastic year 1886-87 are \$972,806.94, about \$100,000 more than in 1885. The reported expenditures are \$143,000 less than the receipts. A portion of this surplus has been consumed in taking up warrants previously issued and carried over, and in building school-houses in cities, but in the main it will be brought forward and will place the schools on a cash basis in most counties. At present about forty-five counties are practically on a cash basis. In the other counties from one-fourth to three-fourths of the warrants are discounted. With an economical administration of our finances for the scholastic year 1887-88 the next year can be begun on a cash basis in nearly every county in the State. This will put an end to speculation in

¹ Superintendent Preston writes, under date of March 13, 1888, at the close of the last session of the Legislature, as follows:

"The reform measures embodied in the law of 1886 stood the test, and the law was not changed materially, although there was considerable effort made to do so. We are now on a basis which will remain, and though the law is ahead of public sentiment, I am satisfied that it will draw the public up to its plane."

school warrants, an evil which has annually deprived teachers of thousands of dollars and proportionally decreased the aggregate value of their services.

MISSOURI.

[From Report for 1886-87 of State Superintendent W. E. Coleman.]

NEW LEGISLATION.

The last General Assembly, while making no radical changes in the school law, passed some valuable amendments, among which are the following:

Formation of districts.—The section relating to the formation of new districts and to the change of boundary lines, was greatly improved by simplifying the language and rendering the law more definite in its requirements.

Change of date of school census.—As the apportionment of State school moneys is made in July, the time for making the enumeration was changed from June to the first fifteen days in May, so that the county clerks can make their annual reports before the State moneys are apportioned; this enables the State and county apportionment to be made upon the enumeration in May of the same year.

Colored schools.—The three sections relating to colored schools were repealed and two new sections enacted, which outline the duties of the school boards in unmistakable language. Whenever there are 15 colored children within any school district, they are entitled to the same school facilities as are provided for the white children of the district; but when there are less than 15 in any district, they can attend any colored school in the county, and the board in the district from whence they come must pay for such attendance.

Powers of town and city boards.—The powers of town and city boards were enlarged, by giving them the authority to continue their schools for a term of not less than 7 nor more than 10 months in the year; by authorizing them to locate additional school sites after the first site has been located by the people; by authorizing them "as soon as the funds are provided" to establish an adequate number of primary or school wards, and furnish the same; and by authorizing them to loan any surplus "sinking fund," and apply the interest thereon to augment the said "sinking fund."

Normal school diplomas.—A diploma, granted by any one of our State normal schools, upon completion of the full course therein, is made authority for the holder thereof to teach in the public schools of the State without further examination by any authorized examiner, until said authority is revoked by the county commissioner, State superintendent, or the board that issued such diploma, for causes therein set forth.

RECOMMENDATIONS.

Among the changes in the school law recommended by Superintendent Coleman in the present report are the following:

(1) The establishment of efficient county supervision. This matter was entirely ignored by the General Assembly at its last session.

(2) Making the minimum school term 6 months.

(3) The enactment of a law enforcing the provision of the State constitution forbidding the appropriation of public funds for any sectarian purpose or in aid of any sectarian institution.

This law is being violated daily in many of the public schools of the State, and it results in prejudice and open opposition to the public schools in those communities where it is practised.

(4) The law should specify definitely in what language instruction in the primary schools must be given; two languages cannot be taught in these schools, at the same time, without great detriment to the teaching of English.

ARBOR DAY.

The 15th day of last April was observed by hundreds of school districts as Arbor Day, and thousands of trees and shrubs were planted in the school yards. It has been such a dry season that many of the trees did not live; besides, it was apparent that the date fixed was too late, therefore this date will be observed hereafter on Friday following the annual school meeting, which will be the first Friday after the first Tuesday in April; instructions are given to this effect in the school law; and April 6, 1888, will be observed as "Arbor Day."

MONTANA.

Governor Leslie, in his report to the Secretary of the Interior for 1887, makes the following remarks upon education and school lands in Montana: "Montana is justly proud of her public and private schools. Liberal provision is made by direct taxation for the support of public schools, and good buildings have been erected for these people's colleges in all the populated portions of the Territory. Our cities and towns have substantial, commodious, and even elegant school buildings, and the most approved systems of graded schools, kept up for the larger part of the year. In fact, these schools will compare favorably with the schools, in towns of equal size in any of the States. These public schools are supported by direct county and district taxes, and penal fines for violation of Territorial laws.

"The county taxes can not be less than 3 mills nor more than 5 mills per dollar on the valuation of all taxable property. Districts may vote additional taxes for building, apparatus, and salaries of teachers.

"The amount of school money raised by direct taxation during the last year was \$223,871, and from fines in various courts \$6,466, making for public schools, \$230,337."

SCHOOL LANDS.

"Montana has been the home of the white man only a fraction over a quarter of a century; her people have no school fund except as they draft upon their estates by the process of taxation. The General Government has heretofore donated to our people for school purposes lands which consist of the 16 and 36 sections of each township and 72 sections for the support of a State university. But these lands are still held by the giver, and Montana has no title to or control over them. They have been selected and designated, so that the school mark is upon them. It therefore appears to be appropriate for me to ask your attention to this most sacred trust, involving the intelligence and virtue of the future population of this promising Commonwealth.

"I am advised, and believe the information to be true, that very much of these lands has been seized by certain persons, who have them fenced up and live upon them, and in this and other ways are appropriating and consuming their products, greatly to the injury and tending much to the destruction of this valuable school property, and I am assured that this species of taking for private uses of the wrong-doer has been going on for a number of years.

"Moreover it is a fact that already some portions of these school lands have been lost, in this, that a portion of them were found to have been appropriated before they were surveyed and designated for school or university purposes; and still another portion was taken as mineral lands.

"I ask for the people of Montana that such action be taken as will insure the immediate expulsion from these lands of every person who is engaged in their occupancy, cultivation, or selfish appropriation in any way, and that ample provision be made for their oversight and protection against trespass and spoliation."

NEVADA.

State Superintendent W. C. Dovey writes as follows: "During the year there has been a revival of interest in educational matters, both among teachers and the public generally.

"The State teachers' institute, held at Reno during Thanksgiving week, was the largest, most successful, and most profitable ever held in this State. Many teachers came from a distance of more than 200 miles to attend the meeting. A State teachers' association was organized, which already embraces in its membership a majority of all the teachers in Nevada. From three to four meetings will be held each year in different parts of the State, besides State teachers' institutes. One of the chief objects of the association is to arouse public interest in education, to the end that much needed legislation may be secured thereby.

"County supervision in Nevada is a failure, and must remain so as long as county superintendents receive an annual salary of from three to four hundred dollars only. My

predecessor, Hon. C. S. Young, made vigorous and persistent efforts to secure through the Legislature reform in county supervision, but without avail, for the session of the Legislature which met in January, 1887, passed an act making district attorneys *ex officio* county superintendents, thus destroying the last vestige of county supervision. Let us hope, if we can, that this retrograde legislation may produce, by its excessive viciousness, a reformation so long deferred."

NEW HAMPSHIRE.

[From Report for 1886-87 of State Superintendent J. W. Patterson.]

RESULTS OF THE CHANGE TO THE TOWN SYSTEM.

The present State report affords material for a study of the results of the compulsory change from the district to the town system, under the law of 1885. It is found that the number of school districts has been reduced from 1,890 to 275, and that the number of districts organized under special acts is only 46, which is six less than were reported the previous year. There has been a decrease of 494 schools numbering 12 scholars or less,—schools that were not needed, but were necessarily kept up at a wasteful expenditure of public funds under the old system. Included in this number there were a few schools numbering more than 12 scholars. From the same cause, the average length of the schools for the whole State the past year has been 22.39 weeks, while the previous year we had but 20.37 weeks.

If we multiply this average increase of 2.02 by 2,276, the number of schools in the State, we shall have 4,598, which shows the total number of weeks of increase which the new law has given to the schools of the State.

The length of the village schools has not materially varied from previous years, but the outlying schools have increased, in towns which have united their small schools, from one-third to double their former length.

The number of enrolled scholars given in the report of 1886 is 64,219, while this year we have only 60,770. This apparent decrease has resulted from the opening of parochial schools, and from the more accurate returns of the school boards.

The number of teachers employed in the public schools under the new law is 679 less than under the old. The average wages of male teachers per month the past year has been \$41.03. The year previous it was \$40.22. The average wages of female teachers the past year has been \$24.46 per month, as against \$23.56 the year before. There have been 154 towns in which teachers from normal schools have been employed the past year, and only 142 the year previous. The average attendance to each school of the State has increased from 16.16 in 1886 to 18.73 in 1887. These are some of the results of the new law.

The new school law has run the gauntlet of misrepresentation and abuse for a year, and has come forth stronger in itself and in the number of its friends than when it entered upon its course. No law ever encountered, at the outset, bitterer or more groundless prejudices than this, and none ever disarmed opposition more quickly, and demonstrated its power to benefit the State.

The town reports, with hardly an exception,—and many of them were prepared by boards hostile to the law when elected,—comment favorably upon the results of the new system. There has been a more equitable distribution of educational opportunities than formerly, and, as a rule, better teachers have been employed and more careful supervision given to their work.

FREE TEXT-BOOKS.

By an act passed in 1883, any town or district may, at any lawful meeting, raise money, by taxation or otherwise, for supplying the scholars in the common schools with suitable text-books free of charge. A number of towns and cities in the State have adopted the law, and have been more than satisfied with the results. It has been found that school boards could purchase books for all the schools at less than two-thirds the cost to private parties; that the plan gave to boards an easy method of securing a uniform system of text-books; enabled them to reduce the number of classes to reasonable limits, and so enhance the educational value of a majority of the schools.

Superintendent Patterson recommends that the free text-book law be made compulsory instead of permissive, that the schools may become more absolutely free to the poor, and more efficient and beneficial to all.

The law is popular with teachers, parents, and scholars wherever it has been tested, and would seem to be the next step in the line of progress. With this system it will be easier to establish consecutive courses of study, now impossible by reason of a multitude of different books and classes; and the scholars will be ready for work on the first day of school.

SANITARY SURVEY OF SCHOOL-HOUSES.

A sanitary survey of the school-houses of New Hampshire was commenced by the State board of health about 2 years ago. A blank book containing 50 questions was prepared and sent directly to the teachers. In addition to the questions, a sketch of the ground plan of the house was asked for, and a page divided into squares was appended in order that the teacher might be able to draw the plan readily to any given scale.

The questions embraced all the important points connected with school-house sanitation. The size of the school-house, also the size of the different rooms, was obtained by actual measurement, and by a comparison of these in the report their accuracy was in a measure proved. Reports were received from 1,228 school-houses.

A study of these reports proves conclusively that the school-houses of the State were constructed without any reference to the amount of air space which science and experience have proved necessary for the welfare of the pupil. The average cubic air space per seat for all the schools reported upon is 173.8 feet, whereas 250 is the smallest tolerated by any standard authority, and then should be accompanied by suitable provisions for ventilation, a condition not fulfilled by the school-houses of New Hampshire. The average cubic air space per seat does not reach 250 feet in a single county in the State, the nearest approach to it being in Hillsborough County, where it is 244 feet.

The amount of lighting or window area necessary for a school-room has been variously estimated at from one-sixth to one-third of the floor space. In 1,068 school-rooms in New Hampshire, however, the lighting area is less than 16½ per cent. of the floor area, and in 488 rooms it does not exceed 10 per cent., and in 26 rooms it is 5 per cent. and under. Moreover, the windows are badly placed. If it had been the direct object to destroy the eyesight of the pupils, better plans could not have been produced than evidently exist in regard to location of windows in these rooms. The arrangement in most of the rooms is abominable, and can not fail to have an exceedingly bad effect upon the eyesight of the scholars. In 402 rooms there are windows directly in front of the pupils, a condition which should be prohibited by the strictest law. In 271 rooms light is admitted from all sides, and in 781 from three sides.

It is universally conceded, continues Superintendent Patterson, by all experts in school hygiene that, whenever possible, light should be admitted from one side only, and in no case from more than two sides of the room. In the latter case it must be in such a manner as not to produce cross lights.

Under the circumstances, then, it is no wonder that 600 near-sighted pupils are reported.

The condition of the public school-houses with regard to water supply, privies, cellars, heating, and drainage is equally unsatisfactory; in short, it may be said without exaggeration that the revelations of these reports are well calculated to excite alarm in the minds of persons sensible of the importance of good sanitary surroundings for school children.

Reference is made to the Index for other information concerning education in New Hampshire contained in this Report.

NEW JERSEY.

NEW LEGISLATION.

Consolidation of school districts.—The State board of education, upon the application of a majority of the trustees of each of the school districts of a township, not exceeding 4 square miles in area, may consolidate such districts into one school district. In each consolidated township district there are to be elected six school trustees, or two from each ward if divided into wards. Such trustees are to be subject to all the provisions of the law relating to district trustees now in force.

Loans to cities.—Any city may borrow money, not exceeding in the aggregate \$30,000, for the purchase of land and buildings for schools, and give bonds therefor.

Expenditures by cities.—Any city may raise by taxation and expend annually for current purposes a sum which, together with the State apportionment, shall be equal to \$15 per capita of average number enrolled.

Industrial education.—Whenever in any school district there shall have been raised, by special tax or by subscription, or by both, not less than \$1,000 (instead of \$3,000, as heretofore), for the establishment of a school or schools for industrial education, or for the purpose of adding industrial education to the course of study pursued in the public schools, there shall be appropriated by the State a like amount; also the State shall appropriate annually for the maintenance of such school or study a sum equal to that appropriated by the district, not exceeding \$5,000 in any one year.

Right of women to vote.—Women shall have the right to vote at any school meeting in any school district where they may reside.

School district bonds.—The bonds of the several school districts shall be a lien upon the real and personal estates of the inhabitants of said districts, as well as upon the property of the districts. District clerks shall report to the State superintendent each year the condition of the district indebtedness.

For other information contained in this Report concerning education in New Jersey consult the Index.

NEW MEXICO.

[From Educational Report of Trinidad Alarid, Territorial Auditor, for 1886-87.]

No complete statistics of education in New Mexico have been collected since the United States census of 1880. Those given in the educational report of the Territorial auditor for 1886-87, a summary of which appears below, are not only very defective as regards the number of counties reporting, but bear internal evidence of unreliability. The school population (five to twenty years) is less than that reported by the census of 1880, one county reporting a school population of only one-fourth of the enrolment. Sierra County reports an average daily attendance more than three times as large as the enrolment.

Superintendent Parker, of that county, makes some very pertinent suggestions tending to more complete and accurate reports by teachers and school officials.

STATISTICAL SUMMARY.

	Number of counties reporting (14 in Territory).	Report of these counties for 1886-87.	Whole Territory in 1880 (U. S. census).
School population (5 to 20).....	All.	36,435	40,415
Enrolment.....	9	13,136	4,755
Average daily attendance.....	10	11,024	3,150
Teachers { Males.....	9	227	128
{ Females.....	8	74	36
{ Total.....	12	414	164
Duration of schools, in days.....	8	57	
Salaries of teachers.....	6	\$33,313	\$23,002
Total expenditure.....	5	\$37,018	\$28,973
Value of school buildings.....	6	\$68,204	\$13,500

GROWTH OF THE PUBLIC SCHOOL SYSTEM.

The above figures, incomplete and unsatisfactory as they are, establish the fact that there has been within a few years a notable improvement in educational affairs in New Mexico. The enrolment in nine counties during the past year was nearly three times as great as that of the whole Territory in 1880, and a corresponding advance in other respects may be noted. Seven years ago there existed scarcely anything deserving the name of a public school system; only about 4 per cent. of the population were enrolled in the public schools against an average of over 20 per cent. for the United States. There are now probably about 12 per cent. enrolled, and a well-defined school law in operation which will serve as a stimulus to the further development of an organized and unified system.

PRESENT CONDITION.

In regard to the present condition of the schools Governor Ross says in his annual report: "There has been a marked improvement in the educational affairs of the Territory during the past year. There is a growing appreciation among the native people of the necessity and advantages of acquiring an education in the English language, and in the American methods of thought and of business and general affairs.

"A compulsory school law was enacted by the last Legislative Assembly, which, though crude, is a step in the right direction, and its general effects will be good. The number of public schools has been largely increased throughout the Territory, and the attendance improved correspondingly, as has also the general morale of the system. The public

school system is assuming a condition of coherency which has not characterized it heretofore. The superintendents are generally intelligent, educated gentlemen, with good capacity for organization, and devoted to their work, and the good results of that work are manifest in the reasonably rapid improvement, often under adverse circumstances, which is observable."

One of the most encouraging signs is the increased interest in education noted in the reports of the county superintendents. In San Miguel County "the attendance is two times, and in many places three times as much as in previous years." In Sierra County the superintendent visited a school, and "before the close of the afternoon session, not less than fifteen persons, parents, relatives, or friends of the pupils, visited the school. * * * With such sentiments prevailing among the people a proper enforcement of a good school law must produce great results for good in the near future."

COMPULSORY ATTENDANCE.

The compulsory school law contains no requirement as to age, leaving all the "school population," *i. e.*, those from 5 to 20 years of age, to come within its scope. With regard to the character and effect of this law Superintendent De Baun, of Socorro County, writes: "The new compulsory (?) school law, although imperative, is having a good effect in some districts where it is thoroughly understood, and at least has proven that a proper compulsory law would have the desired effect and cause a better attendance. In many of the native districts it has been customary for parents to keep their children away from school for frivolous reasons, such as doing small chores, etc., and the teachers and directors have heretofore been unable to put a stop to the abuse; but now a threat to resort to the so-called compulsory law has the desired effect quite frequently, and compels a better attendance. While it is true that many of these people are very poor and almost unable to live without the work of their children, especially of those who have reached an age when their labor is of some value, yet even the parents in many instances are beginning to appreciate the fact that in at least an ordinary education lies all hope for an improvement of their condition. It is possible that in the near future a compulsory law, not quite as crude as the last attempted legislation, will be passed, in which case the lawmakers might conclude that five years is too tender an age to compel children to regularly attend school. They will learn more at home, devoting even less than one hour a day to their simple studies; and when it is considered that some districts are miles in extent and but sparsely settled, such a law is not only cruel, but impossible of enforcement."

TEMPERANCE INSTRUCTION.

Superintendent Parker also reports: "Only one pupil in the county has been instructed in physiology during the year. Instruction in this subject and in the effects of alcohol and tobacco on the human system, I deem of the greatest importance, and in compliance with the recent act of Congress on this subject I have determined to require of teachers a thorough knowledge of these branches."

PRIVATE SCHOOLS.

The public school system continues to be supplemented largely by private schools in which all the branches of a good English education are taught. The Catholic Church supports fifteen such schools in different parts of the Territory. According to Governor Ross the capacity of these schools ranges from 40 to 300 pupils, and they are generally well patronized and successful.

The value of private school property in Santa Fé County is \$150,000 against \$27,100 for public school buildings.

SCHOOL LANDS.

"The usual provision for school lands," says Governor Ross, "applies to this Territory as to all others. But they, being in no sense the property of the Territory or under its jurisdiction, no steps have been taken or can be taken for their utilization. Ordinarily the Territory on admission into the Union would be entitled to 4,305,920 acres for school purposes, but this amount will of course be materially diminished by the appropriation of some millions of acres to the satisfaction of grants made by the Spanish and Mexican Governments prior to the acquisition of the country by the United States. There will still be left, however, over 3,000,000 acres to the school fund of the State—sufficient for the very handsome endowment of schools, even after discarding from the estimate the worthless and inaccessible lands lying in mountain ranges, if the trust shall be honestly and properly administered."

For other information concerning education in New Mexico, consult the Index.

NEW YORK.

[From Report for 1896-98 of State Superintendent Andrew S. Draper.]

The total expenditure for common schools exceeded that of last year by nearly half a million dollars; nearly 97 per cent. of this increase belongs to the cities. Of the increase in the value of school property, less than 1 per cent. is reported from the towns.

CONDITIONS OF EDUCATIONAL WORK IN DIFFERENT PARTS OF THE STATE.

In the cities.—As would be expected, the greatest energy and vigor are manifest in the cities and larger villages. Here extensive buildings, with such modern appliances as experience has shown to be most essential to school purposes, are provided; and instructors, who enjoy what amounts to a life tenure of office with fair compensation paid at regular and stated intervals, are employed. The terms cover about forty weeks each year. The text-books are uniform in all the schools subject to the same management, and are the latest and best in the world. The courses of study are systematically arranged. There are incentives to promotion and graduation. The schools are commonly supervised by competent superintendents, who perform their work intelligently and thoroughly. These superintendents form a sort of enthusiastic and progressive educational brotherhood; they are in frequent communication, either directly or through educational journals; they hold conferences at least annually for the discussion of matters involved in their work; and they are quick to seize upon suggestions which give promise of good results. The outcome of this is that in the schools under their supervision there is very general similarity in the methods and system employed, and these are ordinarily of proved and acknowledged excellence.

Yet school work in great cities is encompassed with innumerable perplexities. The conditions of life among the people are widely different in all localities, but these differences are multiplied and intensified in great and thickly settled communities. All classes meet in the public schools. The schools are large. The grading and classification of pupils are necessarily close and arbitrary. Individuality disappears, and there is small opportunity to bestow special care upon those personal traits of character and genius which in smaller and less mechanical schools are developed and cultivated so advantageously. The exactions and controversies of politics unfortunately encroach more upon the administration of school affairs in large places than in small ones. The people are farther removed from the schools, and they manifest less interest in them because they have less responsibility and power in managing and directing them. It not infrequently happens, also, that the law gives the granting of appropriations for the extension or even the maintenance of a city school system with the common council, or some board which, in either case, was chosen without any reference to the schools, and which seems bound to offset its extravagances in other directions with severe parsimony towards the schools.

In the country.—But nearly half the children of the State are in the rural districts. Here the schools are very much smaller, and of course there are many more of them. There are 11,253 school districts in the State outside of the cities. Of these there are 82 in which the entire property of the district has an assessable valuation of less than \$5,000. There are 457 districts in which the valuation is under \$10,000; 1,578 districts are under \$20,000; 2,423 districts have a valuation above \$20,000 and under \$40,000; and 7,252 districts have a valuation above \$40,000. It necessarily follows that in a great many districts the tax rate must be large or the receipts must be excessively small and the people very commonly feel poorer than they really are. In many cases the school-houses are cheerless and entirely unfit for use, but it seems as though the legislation of last year must work a reform in this direction. In these rural schools the work done depends almost exclusively upon the character and capability of the teacher. There is no "system" to fall back upon, no machine which will turn out passable work, whether or no. If the teacher is discerning and bright and enthusiastic, results will frequently be attained which surpass any accomplished in the great schools; if indifferent, the results are of no consequence. Good teachers will of course soon find places in the larger and wealthier districts. All teachers are entitled to consideration, for their work is trying and exacting; but this is more strikingly so of those in the cross-roads districts than elsewhere. Their pay is small; prior to the legislation of last year it was received only after many months of labor, and the wrong is not yet altogether set right. Their work is not confined to a single grade; they must meet the requirements of all grades and all classes. They must lay out their own course of study, if they have any. Text-books are frequently antiquated; there is no uniformity, even in the same school, and frequently not in the same class, and the teacher finds it impossible to work an improvement. The school is very likely maintained only twenty-eight weeks in the year, just long enough to share in the public moneys. Attendance is irregular. Trustees drive

hard bargains, for the number of young persons who want the place is very large. Continual change in the teachers is the order of the day. The time of the employment is but for a single term, and frequently the trustee undertakes to make it by the day or the week, in order that he may be free to make a change at any time, or that he may withhold pay, in violation of the spirit and intent of the statute, for the week occupied in attendance upon a teachers' institute. Supervision amounts to little or nothing, for distances are great, during a good part of the year roads are impassable, and it is physically impossible for the commissioner, with generally more than one hundred schools under his charge, to visit each very frequently.

In view of the foregoing considerations, Superintendent Draper recommends for serious inquiry, *first*, whether it would not be well to lengthen the term of office of sole trustees, or to provide that in all cases there should be at least 3 trustees, 1 of whom only should go out each year; or *second*, whether it is not advisable to discontinue the district as the unit of school government and unite all the schools of a town under one management and support them all by a common tax; and *third*, whether teachers should not be employed at the beginning of the school year for the whole year, unless removed within the year for cause, on account of moral delinquency, of improper conduct, or of being unable to properly fill the position.

ATTENDANCE.

There is a large uneducated class in the State, and our statistics show that it is growing larger. The attendance upon the schools does not keep pace with the advance in population. Recent legislation forbids the employment of children under 13 years of age in any manufacturing establishment, but no adequate provision is made for gathering them into the schools, and the number of children in the streets grows more rapidly than the number in the schools. Indeed, nothing practical has ever been done in this State by way of compelling attendance upon the schools. The result is sadly apparent and the premonitions are full of warning. Some occurrences of the last year have particularly aroused public interest in the matter and point to the wisdom of painstaking consideration and vigorous action.

To be sure, we have a compulsory education law upon our statute-books, but it is a compulsory law which does not compel. It has never been acted under to any considerable extent, and, this being so after 14 years of trial, it is fair to presume that it never will be. In my opinion there are good reasons why it has never accomplished what was desired of it. In the first place it requires members of boards of education to look after and apprehend delinquent children, and it is unreasonable to expect that officials elected only to manage the schools, and who serve without pay, will devote the necessary time, or that they will engage in work which should devolve upon a policeman or constable, or some other officer specially charged with and paid for such service. Again, the penalties provided for in the act run mainly against children, and no people will be swift to enforce penalties against children for delinquency, not amounting to crime, for which they are not so properly answerable as are their parents or guardians. The penalties in the act which go against parents are mere fines, so inconsiderable as to be ridiculous, and the machinery provided for collecting them is too cumbersome and expensive to be commonly made use of. Moreover, the act requires that children under 14 years of age should attend for at least fourteen weeks in the year. Attendance for so small a part of the year is hardly of enough importance to justify any serious effort to insure it. Again, the law does not require communities to act in the matter, nor does it provide any adequate school facilities for the accommodation of delinquents if brought in.

ARCHITECTS' PLANS FOR SCHOOL-HOUSES.

Chapter 675 of the Laws of 1887 directed the State superintendent to secure and publish the most improved designs for school-houses to cost from \$600 to \$10,000, to accompany them with appropriate suggestions in relation to the preparation of the grounds, and the arrangement of the building with reference to heating, ventilating, sanitation, etc., and then to publish for gratuitous distribution. In carrying out this direction, I invited competition among architects and secured the presentation of fifty-eight different designs distributed in six classes. The most artistic and perfect designs will be published as early as practicable, and it is confidently expected that as a result of this movement the coming years will witness a greatly improved class of school-houses in the rural districts of the State.

PROMISE OF AN EDUCATIONAL RE-ORGANIZATION.

There seems to be unmistakable promise of an educational re-organization and revival in this State. Public occurrences during the year have forced the subject upon the attention of the people. Our supervisory officers and teachers are coming more and more to realize the importance, as they are striving more and more earnestly to accomplish the organization of a comprehensive, symmetrical, and harmonious State educational

system, in which the district schools, the union schools, the high schools, the academies, the normal schools, and the colleges and universities shall have their appropriate place, and shall not rival or antagonize, but arrange their courses of instruction so as to support and supplement each other and work intelligently together for a common and beneficent purpose.

[Special statement furnished the Commissioner of Education.]

EDUCATIONAL PROGRESS.

State school fund apportionments.—Below is presented a schedule of the annual apportionment of the State school fund for the past nine years, beginning with the year 1879. This table exhibits a steady and healthy growth and excellent management on part of the State boards of school land commissioners:

State apportionment for 1879.....	\$36,137.15
State apportionment for 1880.....	45,903.54
State apportionment for 1881.....	51,778.40
State apportionment for 1882 ^a	45,651.20
State apportionment for 1883.....	48,353.25
State apportionment for 1884.....	55,400.25
State apportionment for 1885.....	59,046.70
State apportionment for 1886.....	74,571.32
State apportionment for 1887.....	87,217.00
Total	504,058.81

In addition to this, special attention is called to the following statistical summaries. This exhibit indicates a marked improvement in the public school work of the State:

STATISTICAL SUMMARIES.

[For the school years ending the first Mondays in March, 1886 and 1887.]

	1886.	1887.	Increase or decrease.
Whole number of organized districts in the State.....	1,371	1,491	I.....120
Number of districts reporting.....	1,309	1,464	I.....155

Amount paid for school-house sites.....	\$1,779.81	\$8,593.00	I.....\$6,813.19
Amount of State school funds apportioned to the several counties.....	\$74,571.30	\$87,217.00	I.....\$12,645.70

^a Year of the rust.

NEW LEGISLATION.

Salary of State superintendent.—The salary of the State superintendent of public instruction has been raised from \$1,500 to \$1,800.

Salaries of county superintendents.—The annual salaries of county superintendents are to be determined by the county courts; the salaries now being paid, however, are to be maintained.

Teachers' institutes.—Each county superintendent is required to hold annually a teachers' county institute for a term of not less than three days; all teachers in the county are required to attend, and the county superintendent may at his discretion revoke the certificate, reduce the grade, or refuse to grant a certificate to any teacher who refuses to attend a county institute without cause.

Examination of teachers.—In each county there is to be a board of county examiners, composed of the county superintendent and two persons appointed by him. This board is to hold quarterly examinations for the benefit of persons desiring teachers' certificates. Such certificates shall be valid only in the county where given. They are to be of three grades, and to continue in force two years, one year, and six months, respectively:

(1) Certificates of the first grade are issued to persons who have taught at least twelve months and have attained at examination in the branches required by law, an average of 90 per cent. of all questions asked, without falling below 70 per cent. in any one branch.

(2) Certificates of the second grade are issued to persons who have taught not less than three school months, and who have made at examination a general average of 80 per cent. without falling below 60 in any one branch; second-grade certificates shall not be issued to the same persons more than twice, and then only upon re-examination.

(3) Certificates of the third grade will be granted to persons who have made a general average of 70 per cent., without falling below 40 per cent. in any one branch. Certificates of the third grade will not be renewed, and will not be issued to the same persons more than once. Temporary certificates or permits to teach may be granted by the county superintendent upon examination in cases of necessity, and valid only until the next regular public quarterly examination.

For other information concerning education in Oregon consult the Index.

PENNSYLVANIA.

[From Report for 1886-87 of E. E. Higbee, State Superintendent.]

GENERAL STATEMENT.

The general advance of the schools during the past year has been very satisfactory. Fifteen new school districts have been formed, making the present number 2,281. The increase in number of schools has been 379, making the total at present 21,062. The increase in number of graded schools has been 357, making the present number 9,444. Four superintendents have been added to the work of school supervision, making the present number 115. The increase in number of teachers has been 519; male teachers 340, and female teachers 179, making the present total 23,822. There has been a slight increase in the average monthly salary of male teachers, and a small decrease in the average monthly salary of female teachers. The average monthly salary of male teachers is \$38.53, and of female teachers \$29.86. The length of school term is steadily advancing. The average term is now 7.75, an increase of .62. The increase in number of pupils, excluding Philadelphia, has been 9,235. Many new and excellent school buildings have been erected throughout the Commonwealth.

RECENT LEGISLATION.

State appropriation.—The increased appropriation of \$500,000 to our public schools ought to give great encouragement to our educational work, removing the necessity of too severe local taxation. In our centres of advanced culture, it is true, schools will be vigorously carried forward at any cost. Here the public sentiment is such as to enforce a proper attention to the young. But in the many sections of the Commonwealth where the benefits of intellectual discipline are not so fully recognized, schools will not advance if made to depend too largely upon local taxation. Here the absence of culture shows itself in the want of interest in the same. In our judgment, therefore, the increased appropriation will greatly aid the department in bringing the schools, especially of such sections, up to a higher standard of efficiency. There must be care, on every hand, that the increased fund be rightly applied. It is for the good of the schools. It must not be used by the townships or school districts in such way as to lessen their own vigorous support of the schools.

Minimum school term—six months.—We are gratified that at last the minimum school term has extended to 6 months. The teachers of the State have been urging this for years. By the Act of May 8, 1854, the minimum term was fixed at 4 months, and so it continued for 18 years. By Act of April 9, 1872, it was extended to 5 months, and so continued until this year. It is surprising that during all this time about 800 townships or school districts, embracing nearly 6,000 schools, failed to increase the term a single day.

It must not be supposed for a moment that the Legislature, in fixing the minimum term now at 6 months, intended to favor so short a term or to establish it as a proper standard. The aim of the law is to lengthen short terms, not to shorten long terms; and it is an encouraging fact that our average school term is quite beyond what has been fixed as the minimum term, and is steadily advancing.

The benefits of this law must be apparent to any one. It will give, during the coming year, one additional month of school discipline to over 225,000 children in Pennsylvania. We must guard against weakening the benefits of this law to teachers as well as to children. Directors should not make the teachers bear the burden of this effort to advance, by lowering their monthly salaries so as to make the cost the same as before. Any conduct of this kind will rapidly show its evil effects. Good teachers will be driven to other and more advanced districts, and a lazy indifference soon characterize the district in which it is practiced. We are satisfied, however, that only in rare cases will any such course be pursued. On the contrary, we feel convinced that it will not be long before a school of only 6 months will be regarded as an anomaly.

Employment of children.—The act prohibiting the employment of children under 12 years of age to work in or about mills, manufactories, or mines, should insure, in many localities, largely increased school attendance of children under the age named. To be made properly effective, this law should be supplemented by legislation requiring a careful school census under direction of the authorities of each school district in the Commonwealth, and providing for the appointment of inspectors, whose duty it shall be to see that its provisions are not violated by employers. Thus fortified, and the law properly enforced, it would prove a vast boon to the children and result in great good to the State.

The act referred to is as follows:

"SEC. 1. *Be it enacted, etc.,* That it shall be unlawful for any person, persons, firms, companies, associations, or corporations, to employ any child under the age of 15 years to do any work in or about any mill, manufactory, or mine in this Commonwealth.

"SEC. 2. That any person, persons, or corporations who may violate this act shall, on conviction, pay a fine of not less than \$20, nor more than \$100, at the discretion of the court. Said fines, arising from the violation of this act, shall be paid to the treasury of the proper county where said violation shall occur."

Approved June 1, A. D. 1887.

For other information concerning education in Pennsylvania consult the Index.

RHODE ISLAND.

[From Report of Thomas B. Stockwell, Commissioner of Public Schools, for 1886-87.]

ATTENDANCE.

The falling off in attendance the past year is due to two prominent causes: first, the prevailing sickness throughout the State, and secondly, the negligence upon the part of the authorities of certain places in enforcing the compulsory law.

Seldom has a single year witnessed such widespread sickness throughout the State. In not a few towns or localities schools have been closed for absolute lack of pupils, and in other cases the absentees for this cause have often numbered half the school. The diseases have seldom been of a violent nature and but few deaths have occurred among the school children, but the work of the schools has been very greatly interfered with, and the average attendance brought down quite low.

The average is also very materially affected by the rule, which is quite generally enforced now, that when a child is sick with any of the ordinary zymotic diseases all of the other children of the same family are to be excluded from school. At first sight such a rule may seem rather harsh, but a little reflection will convince one that such a course is in the interest of the general health, and hence of every one. There is no question but that such a rule, strictly carried out, will tend to restrict such diseases to comparatively narrow limits, and even to aid rather than hinder the school work.

As regards compulsory attendance, the truant law is ignored and practically nullified in the city of Providence and some other places. This is due in the main to indifference.

By the terms of the law its enforcement is made very largely dependent upon those who have had little or no interest in the question of education, and who, therefore, can be expected to have but very limited knowledge of the issues involved and the necessity for action. Again, the enforcement of any such law will inevitably at times and in places interfere with the personal interests of parties holding prominent positions or exercising considerable influence, and the official finds it easier to yield to such influences than to withstand them. But back of these causes lies the fact that as yet the people have not become sufficiently aroused to give voice to their belief. There has not been a sufficient recognition of the necessity for action, or that any great number were in real need of the law's intervention in their behalf. When the facts come to light, public sentiment will demand a more thorough enforcement of the law.

A sufficient time has not elapsed since the enactment of the revised truant law to say definitely how beneficial the changes have been. It should have, however, the effect of stimulating attendance, as did the original truant law enacted four years previously. In every town there is now at least one truant officer, and a truant ordinance has been enacted. The machinery for carrying the law into general effect therefore exists. But it is to be noted that in some places it is almost, if not quite worthless, for the lack of any suitable provision for the compensation of the truant officer. Still, if only the meagre amount of work be done, for which provision is made, that will have a very healthful effect, and if even that be maintained much good can be accomplished. Because the whole work can not be done is a very poor reason for not beginning it and doing what can be done.

NUMBER AND SIZE OF SCHOOLS.

The number of ungraded schools has diminished by 7 during the year, while the graded schools have increased by 32. This shows that the movement of the population is still from the farms and rural sections of the State to the centres, and that the advantages of education are being curtailed for those who remain. For it seldom happens when a district becomes so sparsely settled as to be no longer able to maintain a school, that there are no children left there; hence, when the school is abandoned, the two or three who survive are obliged to travel two, three, or more miles, or go without an education. There is an evil here that can be met only by adopting some scheme or plan of school maintenance different from that which so generally prevails in the towns of the State. In such cases the locality or district is absolutely unable to make the proper provision for the children, and unless the unity of interest and responsibility, which really inheres in the town and State, be recognized and acted upon, they will go uncared for.

The increase in the number of graded schools is partly accounted for by the fact that in several communities additional schools have been provided, thereby relieving schools greatly overcrowded. This has been done to such an extent as to reduce the average number belonging to each teacher from 35 to 33.

TEACHERS.

There has been an increase this year of 35 in the number of different teachers, and of 40 in the number regularly employed. It is an encouraging sign to note that the gain in permanent teachers is the greater of the two. It shows a tendency to permanency that is desirable, and it also indicates that correct views as to the proper number of pupils for one teacher are beginning to prevail. No teacher can do passable work with from 50 to 75 pupils, and it is an act of cruelty to both teacher and pupils to compel them to make the attempt.

There has been an increase in the wages of teachers of \$2.82 per month for males and 53 cents for females. These results are probably due in great measure to the effects upon the smaller towns of the increased State appropriations. They have been enabled in many cases to offer sufficient inducements to normal graduates and teachers of experience to hold them, and thus have been secured unusual advantages. One effect of this has been that at no time during the year have there been any such teachers waiting for places. The demand has always been ahead of the supply.

FREE PUBLIC LIBRARIES.

The number of public libraries has been increased by two, and there are now pending action for organization several libraries in various parts of the State, so that it may be safely said that the general interest in this branch of the work was never greater than at the present time.

The total amount appropriated for the aid of the thirty-seven libraries was \$3,950. The total number of books in all the libraries was 133,484, an increase of 10,442 volumes from last year. The circulation is 293,212, or 6,004 less than for the previous

year. The falling off is mainly in the two largest libraries, those of Providence and Pawtucket, while in the smaller libraries the circulation was fairly well maintained. It is impossible to explain these fluctuations in the circulation of the libraries, but unless they are of a much more serious character than any yet noticed, they afford no cause of apprehension. It is probable that any series of years will show a gain, either for the whole number, or in the case of any individual library, unless some special circumstances have intervened to bring about a different result.

The number of new patrons enrolled during the year was 6,422, about 400 more than last year. This shows that the libraries are interesting more and more of the people each year. To be sure they may not hold them all steadily, but having once availed themselves of the privileges, they will ever and again return.

SCHOOL ACCOMMODATIONS.

In connection with the subject of the enforcement of the Truant and Absentee Law, there has frequently arisen that of accommodations for the children. In a number of instances it has been openly claimed that the school-houses would not hold all that would seek admission if the law were to be thoroughly enforced, and that, therefore, there was nothing to do but let it go. Again, it not infrequently happens that a school-house becomes utterly unfit for use, and still the majority of the voters will refuse to make any provision for better accommodations, claiming that it is "as good as they had," or that they have no use for it and they don't care whether there is any school or not. It has happened that there was but one voter in a district where there were over fifty children, and if he declined to move, it was absolutely impossible to raise the necessary funds to make the school-house fit for occupancy.

If the State is to make provision as she does for the education of *all* the children of suitable age within her borders, it would seem as though they should be furnished with the opportunity to obtain that education; that no false policy of economy on the part of a town, or selfish indifference on the part of a few persons who happen for the time to be in a majority in a district, should stand in the way of providing fit and abundant accommodations for them.

From the beginning, the law of Rhode Island has recognized the importance of this point and has made partial provision for securing its proper care. Where the district system prevails, the town school committee are made the judges of the fitness of the school accommodations to the extent of determining whether they are suitable, but not as to their extent. If in their judgment a school-house is unfit for use by a school, they have power to condemn it, whereupon the district can no longer draw any portion of the "public money" for the support of its school. In this way the State has sought to *compel* districts to live up to their responsibilities, and it has unquestionably in many cases, both directly and indirectly, accomplished its purpose.

But there are instances where even the alternative of the loss of the school would not move the hard-hearted tax-payer. Moreover, under the town system there is no such opportunity for compulsion, as there is no one between the committee and the town. It is therefore necessary, in order to carry out the ideas of the founders of our system, that the laws be so amended that in case of obdurate municipalities or districts refusing to conform to the demands of the properly constituted authorities in these matters, they may be compelled to give heed thereto.

GENERAL CONDITION OF THE SCHOOLS.

The general condition of the schools, in spite of many exceptions and some glaring ones, is probably better than at any previous time. The last two examinations for entrance to the Normal School have shown that the general standard of scholarship is rising in the State, the last one in particular being remarkable for the excellent showing made by pupils from the ungraded schools.

Evidences of a more thorough and scientific teaching are to be found on every hand. The graduates of the Normal School are being more generally employed in the district or ungraded schools. The new teachers are not so much superior to the old ones in extent and character of acquirements oftentimes, as they are in methods of teaching, and in plans for classifying and systematizing the work of the school. Economy of time and labor is introduced, and results are secured that are very gratifying.

For other information relating to education in Rhode Island contained in this Report, consult the Index.

SOUTH CAROLINA.

[From Report for 1886-87 of State Superintendent James H. Rice.]

Superintendent Rice visited every county in the State during the year, and delivered addresses upon the subject of free schools. He reports that the people are more thoroughly aroused than ever to the duty of elementary training for their children. More money is devoted to this object than to any other department of the State government.

The public school system in its present form has been the growth of a decade. Ten years ago a 2-mill property tax and a poll-tax were imposed. Since then much good work has been accomplished; the foundations for a system of universal education have been laid broad and deep. Such systems are a growth, however; they must take into account the genius of the institutions, and be accommodated to the habits, resources, and hopes of a people. They cannot be forced except into an unhealthy development. Time must be given for adjustment. On this account progress has been slow, and hasty legislation avoided. The situation, however, is now clear, and the time has arrived to give to the children a good elementary school in every neighborhood in the State. The superintendent recommends the following legislation in order to accomplish this:

(1) An annual voluntary district tax, sufficient to give 10 months' school and free tuition to every child. Many school districts have been already formed under special Acts among the more thickly populated communities, and large sums of money raised for buildings and other purposes. A general law is now desired, to enable all the people of the State to organize into school districts and to tax themselves.

(2) The amendment of the law relating to county school commissioners, requiring them to stand an examination conducted by the State board of education before being appointed. Hitherto the office has been too often bestowed as a reward for party service, and as a consequence has fallen into disrepute. The county commissioner should either be a teacher, or one who has mastered the details and fundamental laws of the profession.

It is also recommended that his salary should be raised to \$1,000, and that he should be required to devote every day to his duties.

(3) The establishment of a State normal school or schools, at the same time fostering existing institutions.

(4) The restoration of their pay to the examining boards.

The statistics show a falling off in enrolment and average daily attendance as compared with the preceding year. This decrease is more apparent than real. There was an error in the return of Berkeley County for 1885-86, doubling the figures; moreover, the schools of Georgetown County were closed during the scholastic year 1886-87 by an Act of the Legislature. Superintendent Rice says that the returns for the next school year will demonstrate the fact that there has been an increase in enrolment and attendance.

[From the message of the Governor to the General Assembly.]

THE PUBLIC SCHOOLS.

There is an apparent decrease in the enrolment, and, therefore, in the average attendance of the public schools for the year 1886-87. This is due to the closing of the schools of Georgetown County during the year, under the authority of an act of the General Assembly, and to an error in the last return from Berkeley County. There is beyond question in the schools generally throughout the State a gradual and constant annual increase in the number enrolled and a corresponding increase in the average attendance.

This desirable result has been reached notwithstanding the short crops and the low prices of the past few years. The people of the State are more aroused upon this important subject of education than ever before in their history, and the next report of the superintendent will, in his opinion, vindicate this assertion. They demand longer terms and more thoroughly trained teachers. There should be a general act providing for local taxation to supplement the school fund wherever the tax-payers of a community desire the establishment of schools of a higher grade; and liberal efforts should be made by the Legislature to give greater facilities for the training of teachers in schools specially adapted to that end. The constitution enjoins this, and the people demand it. The report of the superintendent urges the passage of an act to provide for more efficient superintendence, and the argument he advances is so clear and complete as to carry conviction with it. A large amount of money is expended by the State for this most important object—education—and it is the duty of the representatives of the people to see that the greatest possible amount of good is accomplished, and that a return in some degree commensurate with the sacrifices made by the tax-payers is secured. Nothing makes such a handsome return to a State as the provision made for the elementary train-

ing of her children, and this subject should always demand our most thoughtful and earnest attention and our wisest and most progressive legislation.

The superintendent of education has been most active in his efforts to enkindle in the public mind a due conception of the vital importance of popular education to the safety and well-being of society, and has visited every county in the State, addressing audiences and giving his personal supervision to the conduct of the public schools. It is hoped that these efforts will create new and increased interest in this important department of the Government.

For other information concerning education in South Carolina consult the Index.

TENNESSEE.

Reference is made to the Index for the statistical and other information contained in this Report concerning education in Tennessee.

TEXAS.

[From Report for 1886-87 of State Superintendent Oscar H. Cooper.]

GENERAL CONDITION.

While there are some serious defects in the public school system of Texas, it is still accomplishing much in the cause of education, and is making steady advances in the number of schools and the number of children attending them. With its large endowment in bonds and lands, half a million acres, it should become one of the most successful school systems in the United States.

The entire number of schools maintained in the State during the year 1886-87 was 8,987, an increase over the previous year of 267, or 3 per cent. The number of white children enrolled was 295,510, the number of colored children 113,150; total, white and colored, 408,660, an increase of about 3½ per cent. The number of teachers employed was 11,123, about three-fourths of whom were white. The average monthly salary of—

White teachers:	
In counties.....	\$43. 27
In cities.....	69. 39
Colored teachers:	
In counties.....	38. 65
In cities.....	49. 78

The entire amount expended for schools during the year was \$2,016,745.

NEW LEGISLATION.

Teachers' examinations.—By enactment of the last Legislature, examinations of teachers are to be conducted wholly in writing, and the county boards of examiners are required to report on oath the results of the examinations. These regulations have had very gratifying effects and have given universal satisfaction. Sets of questions for these examinations were made out by the State superintendent and forwarded to the county examiners. The use of them, however, is entirely optional with the examiners. In order to secure uniformity in the examinations throughout the State, the use of the questions prepared by the State superintendent should be required by law.

County superintendents.—Provision was made by the Twentieth Legislature for supervision of the county schools by county superintendents, and about twenty counties have availed themselves of the privilege. The county superintendents discharged their duties faithfully and efficiently, and, as the result of their work, the schools have been much improved, the teachers have been encouraged and enabled to perform their work more satisfactorily. Many of the counties did not appoint a superintendent because of their inability to secure a thoroughly competent one for the salary allowed.

Children not enumerated.—The provision of the law that all children whose names had been omitted from the census rolls by the county assessors should be permitted to attend school in the district or community in which they live, has proved to be an eminently wise one. By this measure, a large number of children, who otherwise would have been deprived of all school privileges, through no fault of their own but on account of the carelessness of the county assessors, have been allowed to attend school. The number of names omitted from the census rolls was quite large, amounting in one county alone to about 1,000.

UNIFORMITY OF TEXT-BOOKS.

There is a strong demand throughout the State for uniformity of text-books. In about 25 counties much has already been done in this direction by the voluntary efforts of

teachers and trustees. It is desirable, however, that uniformity be secured by law; at least in each district.

FINANCIAL EMBARRASSMENT.

The most unpleasant feature connected with the school operations for the year was the great deficiency of funds, or rather delay in the receipt of the funds. This deficiency amounted at the close of the year to more than \$1,000,000. As a result, teachers were compelled, either to wait for weeks or months not knowing when their claims would be paid, or else to sell them at a heavy discount,—from 5 to 50 per cent. This was a heavy drain upon a class poorly paid at best, and who, as a rule, were dependent upon their salaries for a support, and therefore could ill afford either to hold their claims or to have them discounted.

The causes assigned for this deficiency were as follows:

(1) The annual apportionment is required by law to be made about the middle of July for the scholastic year beginning September 1, not of money already in the treasury, but of money which is *expected to be received* during the year, and which, therefore, must necessarily be a very uncertain quantity. The receipts from one source especially—from school lands—is an exceedingly variable one.

(2) Only a small portion of the available school fund is received before December, three months after the beginning of the school year.

(3) County collectors are allowed either to pay over the school tax to the county treasurer or to remit it to the State treasurer. The amount of school money collected in some counties far exceeds their apportionment, and consequently, if it were in the hands of the State treasurer, the excess could be used in paying the claims in other counties where the school receipts are less than the apportionments.

(4) The postponement of the collection of the interest on land sales from January 1 to August 1 is partly responsible for the deficiency.

(5) There was no cash balance to the credit of the schools in the treasury at the beginning of the scholastic term.

(6) The receipts from school lands for the last two years were less than in previous years.

Superintendent Cooper recommends as a remedy for the financial difficulty either a loan from the general State revenue, which was considerably in excess of the immediate necessities of the State government, or else a direct appropriation from the State funds.

DEFECTS OF THE SYSTEM.

I. One of the greatest defects in the operation of the school system of the State is the careless and unbusinesslike management of the school funds. This is shown by the discrepancies in the annual reports of the county treasurers and by the conflicting statements in the reports of the county treasurers and county judges. The amount brought forward on the books of the county treasurer at the beginning of the school year, September 1, should correspond exactly with the amount carried forward the day before, August 31, the close of the last school year. But instead of being the same, it will be found different in eighty-one counties. In some counties this difference is quite large, and for all the counties it aggregates about \$75,000. The amount paid to teachers, according to the county treasurers' reports, is found to differ by \$30,000 from the same amount as reported by the county judges.

The State holds no vouchers whatever to show what has become of the school funds, except that so much has been paid to each county treasurer. The county treasurers have practically no check whatever. They are not required by law to report to any one. In many cases in which their attention was called to the discrepancies in their reports, they either gave the matter no attention or else failed to give a satisfactory explanation of it.

Superintendent Cooper suggests three methods by which the disbursements of the public funds could be guarded more effectively.

(1) The State superintendent might be required to inspect annually the records of each local disbursing officer, either personally or through inspectors appointed to assist him in the work.

(2) All disbursements might be made directly from the State treasury. This plan, however, would necessitate delay and some expense.

(3) The third method is that the county superintendent or judge, at the beginning of each month, send to the Department of Education an estimate of the amount needed for that month, when the money will be forwarded to him, and at the end of the month forward the vouchers of the money paid out.

II. The second defect is want of proper supervision. The town and city schools already have efficient supervision, but the county schools, which need it most and could be most improved by it, have practically no supervision at all. It is one of the duties of the county judges to visit the schools, but only three judges in the entire State vis-

ited all the schools in their division during the year; and, even when the duty is performed, it is done in the most perfunctory manner, so that no improvement results from it. It is to be hoped, however, that the legislation already made on this subject will correct this evil.

III. The third defect is lack of uniformity. There are four methods of organization in the county schools, four methods in the city schools, and four methods of taking the scholastic census. As a consequence, endless confusion and mismanagement have resulted, each officer depending upon the other for a performance of the duties.

COMMUNITY PLAN.

This is a feature of the school system peculiar to Texas, and a very objectionable feature it is. In the first place, the community has no definite geographical limits, the prime requisite of a school district. It can not elect its own trustees, and has no power to vote local taxes. It has no permanency about it, but is continually shifting from place to place with the population, and may entirely cease to exist. It has a tendency to foment local strifes and sectarian feelings, which result in the establishment of a number of weak and inefficient schools, where only one strong, progressive school should be maintained.

GENERAL SUMMARY.

Although we find many defects in the operation of the school system of the State, they are only defects in management and can easily be corrected, so that there is every reason for expecting great progress in educational matters. Says Superintendent Cooper: "Texas has some of the elements of one of the strongest free-school systems in the world. The endowment, in bonds and land notes, is already over \$15,000,000. The landed endowment of the schools, if wisely managed, will yield early in the twentieth century \$100,000,000. There are nearly half a million children, taught by more than 10,000 teachers, enrolled in the schools during the present year. The State is rapidly advancing in wealth, population, and intelligence. No single element in the life of the people will conduce more to the progress of the State than an efficient system of public free schools."

UTAH.

Reference is made to the Index for the statistical and other information contained in this Report concerning education in Utah.

VERMONT.

NEW LEGISLATION.

Failure to execute compulsory attendance law.—Sheriffs and prudential committees neglecting to execute the provisions of the compulsory attendance law, after a demand made upon them to do so, become liable to a fine not exceeding \$20.

Return to district system.—A town having abolished its school district system in pursuance of law, may at any second annual town meeting thereafter abolish its town system.

Holidays.—No teacher in any public school shall be required to teach on any legal holiday, nor be subject to any deduction of pay for not teaching.

Tax for school-houses.—If a district neglects to provide a suitable school-house after an order by the selectmen, the selectmen may provide such school-house and assess a tax upon the district therefor.

Report of town superintendent.—Each town superintendent of schools shall at the close of his term of office make a detailed account of his services, stating the date, time spent, and kind of service, and the number of districts in which a school has been taught during the year; but he shall receive no money for his services until he has made to the State superintendent the statistical returns required by law.

Kindergartens.—Towns and school districts may at any meeting vote to establish or pay the expenses of kindergarten schools.

Amended law relating to temperance instruction.—Instruction shall be given to all pupils in all public schools as to the nature of alcoholic drinks and narcotics, and their effect upon the human system. Such subjects shall be taught as thoroughly as arithmetic and geography, and given orally to pupils not able to read; those able to read shall be taught by text-books, of which at least one-fourth of their space, or twenty pages, shall be given to these subjects.

Each teacher of a public school shall be required to certify that such instruction has been given in the school or grade presided over by him or her, before receiving any pay.

Text-books required for this instruction shall be furnished to the scholars at the expense of the State; such books shall be selected by a board of three persons appointed by the Governor.

VIRGINIA.

[From Report of State Superintendent John L. Buchanan for 1886-87.]

In all the essential elements of growth, so far as they can be indicated by statistics, the school system of Virginia has reached this year the highest stage of development thus far recorded during the seventeen years of its history. More money has been appropriated and expended, more schools opened, more teachers employed, more pupils enrolled and in average attendance, than during any preceding year, and also a smaller aggregate amount due teachers at the close of the year than for the past ten years. The information derived from observation and the reports of school officers also indicate an advance all along the line.

NUMBER OF SCHOOLS.

The total number of schools in operation during the year 1887 is 7,140; in 1886 it was 6,763; increase, 377. This is regarded as a very gratifying and encouraging exhibit, and is due to the larger amount of money provided for the schools, the activity and fidelity of school officers and teachers, and the larger measure of encouragement and moral support accorded the system by the people.

When, however, it is considered that only about 30 per cent. of the State school population (5 to 21 years) is in average daily attendance upon the common schools, it is quite evident that there is not a sufficient number of schools to meet the educational wants of the people. The number of pupils attending private schools does not amount to 5 per cent. of the State school population. Therefore, for education in the common school branches, at least, the children of the State are dependent mainly upon the public free schools; and hence the only wise course to pursue is to extend their advantages as widely as possible. To bring the public schools within the reach of all, however, is a difficult matter.

DISTRICTS WITH SPARSE POPULATION.

There are portions of the State which are but sparsely inhabited. In some sections there is not a sufficient number of families residing within convenient distance of any one point to furnish the requisite number of pupils for a legal school, and hence they are practically without schools. In other neighborhoods families residing on the borders of districts are at too great a distance from the schools to patronize them.

Again, as the population consists of both white and colored people, there are not a few districts in which there are enough of children of one race to form a school, and not enough of the other, and, hence, some for this reason are without schools. How to remedy these evils, how to supply these deficiencies, is a perplexing question.

FORMATION OF SCHOOL DISTRICTS.

It has been suggested that each magisterial district be divided into a number of school districts, containing approximately the same number of persons of school age (about 85), and receiving a proportionate share of the school funds. The principle herein involved is undoubtedly correct, but its practical application is attended with great difficulty. There is already in force a law which aims to effect this object, but it is permissive rather than mandatory, and for some reason has not met with much favor.

Some sort of subdivision into school districts does and ought to prevail, but to so subdivide that the same, or about the same, number of persons of school age would be contained in each district would be a difficult, though perhaps not an impossible, undertaking. But supposing such a subdivision to be made, it could not, of course, render scattered communities more compact, and could not, therefore, obviate the inconveniences above recognized. It would doubtless result in a diminished attendance upon some of the schools in sparsely settled districts. It would also necessitate a change in the location of a good many school-houses. School districts containing each the same number of persons of school age would vary largely in area on account of the varying density of population in different sections of the country. Hence, in many instances, pupils would be cut off by the proposed district lines from the schools which they have been attending. Furthermore, a kind of double subdivision into school districts would be necessary in order to accommodate both the white and colored races. This necessity, it will be observed, constitutes a most troublesome factor in the problem, for each school district of 85 pupils is entitled to but one school of the usual length of the school term. If,

then, a part of the 85 pupils are white and a part colored—separate schools being required for the two races—the one part or the other must go without a school. To obviate this difficulty, there must needs be one set of school districts for white children and another set for colored. Again, if the school districts should be so arranged as to contain, even approximately, the same number of persons of school age, a good many fractional parts of districts would be left which it would be hard to properly dispose of.

Such are among the difficulties which would attend the effort to subdivide into school districts in the manner above indicated, and there are, therefore, good reasons for apprehending that such a scheme would hardly prove practicable, at least, for the present. Possibly some other scheme of subdivision might be devised. But any scheme which would not require an approximately equal number of persons of school age in the several school districts could not furnish a basis for an equitable distribution of school funds, and would therefore be liable to the same objections as are conceived to lie against the present system.

Under existing laws, boards of district school trustees, with the advice and counsel of the superintendents of schools, determine where and how many schools shall be opened in each magisterial district. As a rule, they have gone to the limit of the funds at their command, and in not a few instances have opened schools in which the average attendance has proved so small and irregular as to necessitate their suspension. But still complaints reach the central office that some neighborhoods and some families are without school facilities, and in some instances that citizens who have been paying school taxes ever since the inauguration of the system have rarely, if ever, had the opportunity of sending to a public school.

NUMBER OF TEACHERS.

The number of white male teachers in 1886-87, as compared with 1879-80, stands as follows:

	1879-80.	1886-87.
Number of white male teachers	2,478	2,416
Number of white female teachers	1,610	2,889
Excess of white male teachers in 1880		868
Excess of white female teachers in 1887		473

These figures show a large increase in the past eight years in the number of female teachers. At the same rate of increase the schools of Virginia in a few years will be pretty largely in the hands of female teachers.

SALARIES OF TEACHERS.

Superintendent Buchanan calls attention to the circumstance that the wages of teachers are too low, the average annual salary for the State being \$173.46.

In many rural districts the school term is not over twenty weeks (five months), and the monthly salary as low as \$20 or \$25, thus giving an annual salary of \$100 or \$125.

For good teachers such salaries are far too small. But while it may be, and doubtless is, true that some teachers on small salaries are doing better work than others who receive twice as much, yet it can not be doubted that an increase of salaries would increase the efficiency of the teaching force. The laborer is worthy of his hire.

But there is no possible way of increasing salaries without more money. If the number of schools were diminished, more money could go to those that would be continued. But this would greatly increase the complaint about the lack of school facilities. It has been suggested that one teacher could teach two schools in a year—a five-month fall term in one place and a five-month spring term in another, and thus be occupied twice as long and receive twice as much pay. The objection to this is the difficulty of securing the attendance of pupils. The first school would begin by the 1st of August; the last one continue till the 1st of June. During a large part of each term the children in many places would be kept at home for work. If this objection could be obviated, the superintendent sees no reason why a system of alternating schools might not work well.

(It may be remarked that "ambulatory" schools have recently been abolished in Georgia. See page 127.)

Suitable legislation is recommended to secure the prompt payment of teachers' salaries. As few monthly school warrants have passed through the hands of shavers this year as formerly; perhaps less. In many counties teachers have been paid with reasonable promptness. But there ought to be no occasion for discounting any school warrant.

The laws and regulations making the salaries of teachers in certain cases depend upon average attendance are cited, and the arguments *pro* and *con* as to the advantages of this system are given somewhat in detail. In summing up Superintendent Buchanan doubts whether it would be expedient to withdraw this matter from the control of the board

¹These arguments are quoted in another part of this Report. See Index under head of "Teachers."

of education and make it a subject of special legislative enactment. The law authorizing the board to prescribe the minimum number of pupils required to form a public school, is necessary to guard against a wasteful or useless expenditure of public school funds. A different policy in some of the States has worked badly. One annual school report, at least, noted the existence of schools with an average attendance of less than half a dozen pupils, and recommended prompt measures to correct the evil. While all proper effort ought to be made to guard against injudicious or useless expenditure of the public school funds, it would be both just and expedient to make such modifications of, or additions to, existing regulations as will tend to more carefully guard the interests of teachers, and support and encourage them in the discharge of their responsible duties.

PHYSIOLOGY AND HYGIENE.

The enactment of a law is recommended placing physiology and hygiene on the list of subjects required to be taught in the public schools.

SENTIMENT IN RESPECT TO PUBLIC SCHOOLS.

Of the county superintendents reporting to the central office the state of public sentiment regarding public schools, 99 report favorably, 11 report an improvement, and 4 report some opposition.

NEW LEGISLATION.

[From the *Educational Journal of Virginia*.]

School trustee electoral boards.—Under an Act of the General Assembly, in force February 20, 1884, the appointment of district school trustees was vested in county school electoral boards, composed of 3 citizens of each county, elected by the General Assembly. This law has been repealed, and the old law, providing that the county judge, Commonwealth's attorney, and county superintendent of schools shall constitute the school trustee electoral board of each county, with power to appoint and remove trustees, has been re-enacted.

Virginia Normal and Collegiate Institute, summer sessions.—Under the former law the summer session was fixed at 8 weeks, and county superintendents were required to revoke the license of any colored teacher in the public schools who failed "to attend one session, or any part of said summer course for 3 consecutive school years," unless such teacher was excused by the board of education. The present act reduces the length of the session to 5 weeks, and relieves the teacher of the severe penalty imposed for non-attendance.

For further information concerning education in Virginia consult the Index.

WASHINGTON TERRITORY.

The following is taken from the special report of Superintendent J. C. Lawrence to the Governor of the Territory:

PROGRESS OF EDUCATION.

"I take pleasure in reporting progress in the educational affairs of Washington Territory for the past year. The interest taken in our public schools by patrons, teachers, and superintendents seems greater now than ever before. This is shown, first, in the amount of money raised for school purposes, in special tax and voluntary subscriptions, and in other means, aside from the regular tax levied in each county for the support of schools, by the increased amount of school furniture, apparatus, globes, dictionaries, etc., for the use of schools; second, by the interest teachers have taken in institutes the past year—a greater interest than ever before taken. Twenty counties of the 33 in the Territory have held institutes of from 3 days' to 2 weeks' duration. The majority of our teachers have attended these institutes. The counties failing to hold institutes were such as had fewer than 500 children of school age. In some instances the services of trained institute workers have been secured at an expense of several hundred dollars, and teachers have contributed from their own resources to meet these expenses. The new methods of teaching have been discussed and are being adopted. A large number of our teachers have had the best training the Eastern schools afford, and have had successful experience in the East prior to coming here. District clerks and county superintendents have taken pains to make full reports to this office. All these I take to be indications of greater interest in educational matters.

"It is needless to say that the public schools of the Territory are in their infancy. Scarcely more could be expected. With 65,000 children, and a total amount raised for school purposes of only \$500,000, only a portion of which has been used in teachers' sal-

aries, little can be expected. Indeed, I am surprised that we have made so much advancement under the circumstances. The maximum tax for school purposes of 6 mills on each dollar of assessed valuation is not sufficient, yet an increase in the tax would be felt as a burden. Our hope is from another source. Until the school land is sold, and the interest on the purchase-money made a State fund, we can not expect to have our schools rest on a sufficient financial basis. This alone should secure the immediate admission of this Territory into the Union of States. With the proceeds of the sale of the school lands used, as they will be when we are admitted, with the county tax now levied, we will maintain an average of nine months' school in each district. The present average duration of schools is but four and a half months. Admission means four and a half months' additional schooling to 65,000 children now in the Territory."

SCHOOL LANDS.

"The Government has set apart 2,000,000 acres for the use of our schools, but we have at present no control of such lands. A law, indeed, was many years ago passed by the Legislature, and afterwards re-enacted, authorizing the county commissioners to lease them to tenants, but this has naturally been but little acted upon, as there was no power in the premises.

"The value of these lands varies a great deal, from \$2 to \$3 an acre in some localities to \$50 and even \$75 in others. I believe there is no law by which any title to these lands can be vested in individuals, and I recommend that they be left in that condition until the admission of the Territory as a State of the Union."

For other information concerning education in Washington Territory consult the Index.

WEST VIRGINIA.

NEW LEGISLATION.

[From the *West Virginia School Journal*.]

Appropriations for State normal schools.—The maximum aggregate amount to be appropriated to State normal schools has been raised from \$2,000 to \$2,200. The law in its amended form does not permit any part of the amount appropriated to each school when not earned by it to revert to the State treasury, but authorizes the board of regents to use it for the payment of teachers in these schools. This provision will enable the board now to supply these schools with something like a sufficient corps of teachers, and do away with the scaling of salaries that has been suffered in the past.

State board of examiners.—The State board of examiners is to consist of four competent persons, one from each Congressional district, to be appointed by the State superintendent; their term of office is to be four years, and they are to meet at least twice in each Congressional district each year.

The board thus constituted may issue two grades of certificates to such as are found to possess the requisite scholarship and who exhibit satisfactory evidence of good moral character and of professional experience and ability, as follows: First-class certificates, for twelve years; second-class, for six years. Any person holding a certificate of the first-class who shall have taught for eight years of said twelve years, shall be entitled, without examination, to have the same renewed at the expiration of the said twelve years. The second-class, to be issued to applicants of satisfactory attainments in the branches required for county certificates, and in addition not fewer than four other branches, to be determined upon by the board.

The second-class certificates shall be issued upon application, without examination, to the graduates of the State Normal School and its branches, and of the State University when such graduates shall have presented to the board satisfactory evidence that they have taught successfully three years in the State under No. 1 county certificates, two of which said three years shall immediately precede the application for such certificates.

Teachers who shall present to the board satisfactory evidence that they have taught successfully four years under second-class certificates shall be entitled to receive, without examination, first-class certificates at the expiration of the second-class.

All certificates issued by such board shall be countersigned by the State superintendent; and such certificates shall supersede the necessity of any and all other examinations of the persons holding them by any board of examiners, and shall be equivalent to number one certificates granted by a county board of examiners, and shall be valid in any school district in the State, unless revoked by the State board for good cause.

School month.—The school month is to consist of twenty days, instead of twenty-two, as heretofore.

Temperance instruction.—The nature of alcoholic drinks and narcotics, and special instruction as to their effects upon the human system, in connection with the several di-

visions of the subject of physiology and hygiene, shall be included in the branches of study taught in the common or public schools, and shall be taught as thoroughly and in the same manner as other like required branches are in said schools, to all pupils in all said schools throughout the State.

It shall be the duty of the proper officers in control of any school described in the foregoing section to enforce the provisions of this act, and any such officer, school director, committee, superintendent, or teacher, who shall refuse or neglect to comply with the requirements of this act, or shall neglect or fail to make proper provisions for the instruction required and in the manner specified by the first section of this act for all pupils in each and every school under his jurisdiction, shall be removed from office, and the vacancy filled as in other cases.

No certificate shall be granted to any person to teach in the public schools of the State after the 1st of January, 1889, who has not passed a satisfactory examination in physiology and hygiene, with special reference to the nature and the effects of alcoholic drinks and narcotics upon the human system.

[Approved February 7, 1887.]

For other information concerning education in West Virginia contained in this Report consult the Index.

WISCONSIN.

NEW LEGISLATION.

Maps.—Provision is made for distributing annually 1,400 railroad maps of Wisconsin among the schools of the State.

Violations of the compulsory attendance act.—Complaints for violation of the compulsory attendance act may be made by any legal voter of the district, or of any town, city, or village, when the schools are managed by a board of education, and directly to the magistrate having jurisdiction; the section requiring school officers to prosecute under the act is repealed.

Teacher's certificates.—(1) County superintendents are authorized to withhold certificates from applicants known to them to be immoral in character, and are forbidden to give certificates to persons manifestly deficient in learning, or in ability to teach.

(2) Second-grade certificates are to be in force two years, and first-grade certificates four years; the latter, however, may be limited to one year at their issue, if the applicants have had no experience in teaching, and the limitation may be removed when experience evidences that the holders are successful and apt as teachers.

(3) Papers of applicants for certificates written in one county may, in the discretion of the county superintendent, be made the bases of certificates in another county, under the conditions and restrictions named.

The State superintendent is authorized to countersign diplomas of graduates of the University of Wisconsin who have taken the course in the science and art of teaching in that institution, after the holders shall have taught public schools in the State successfully eight months. Any such diploma when so countersigned shall be a certificate of qualification to teach in any public school of Wisconsin until annulled by the State superintendent.

School census.—School district clerks, in addition to their present duties relating to the taking of the school census, will also report the names of the children from four to twenty-one years, and the age of each.

Loans to districts.—School districts are authorized to borrow money to refund indebtedness, so as to extend twenty years the period during which the loan is to be paid. Loans in school districts from trust funds of the State may now be made at the rate of 6 per cent. per annum instead of 7 per cent., as heretofore demanded.

Vote on free text-books.—Districts are required to vote directly at each annual meeting upon the question of providing the text-books for the use of pupils free, and levying a tax to meet the expense.

Forfeiture of State school apportionment.—No apportionment will be made of school money to any town, city, or village which failed to raise by tax during the preceding year an amount equal to that received from the State at the preceding apportionment.

Teachers' contracts.—Contracts with teachers are required to be in writing, and filed in the office of the secretary with copies of the teachers' certificates attached.

Change from township to district system.—Provision is made for organizing independent school districts when a town having the township system votes to abolish the same.

School libraries.—Provision is also made for a system of school libraries to be purchased and managed by the town officers under the direction of the State superintendent. The treasurer of each town may annually withhold from the several school districts of his town one-twentieth of the school fund income appropriated thereto, together with one-

twentieth of all county and town taxes annually raised to secure said income, for the purchase of school libraries.

For other information concerning education in Wisconsin consult the Index.

WYOMING.

The following, from the report of Governor Warren, for 1885, is the most recent general statement with regard to education in Wyoming in the possession of the Bureau:

"Wyoming takes front rank in educational matters, considering her age as a Territory. There is a strong and growing interest on the part of her citizens which cannot fail to keep the public schools up to the standard of our older and wealthier neighbors.

"The Territorial school laws, among other provisions, provide for a Territorial superintendent of public schools, appointed by the Governor, and a county superintendent in each county, elected by the electors of the county. Each school district elects its trustees, 3 to 6 in number, at a 'spring meeting,' and none can vote who did not pay poll-tax the fall previous.

"The law also provides for a 'teachers' institute,' which shall hold annual meetings at some point in the Territory (usually in different towns in rotation), for not less than 6 nor more than 10 days each session. Every teacher or superintendent of public schools may attend, and his fare to and from the institute is paid by the Territory. When there are 15 or more colored children within any one district, the trustees, with the approval of the county superintendent, may provide for a special school. The law prohibits any discrimination as to pay or otherwise on account of sex in employing teachers. Although a compulsory law with penalty clause exists, obliging children from 7 to 16 years of age to attend school at least 3 months in every year, unless excused by physician's certificate or special excuse granted by the district board, yet not to exceed 65 per cent. of all the children are enrolled at public schools, because, first, in cities and towns many attend private, select, or parochial schools; and, second, outside the towns, where thinly populated, many families are so isolated from neighbors that schools cannot yet be established and maintained. This last cause is rapidly improving with settlement. At Cheyenne a convent building is now being completed at a cost of between \$50,000 and \$60,000, by the Society of the Holy Child Jesus; there are also two branches of the Saint John's Parochial School in Cheyenne, with about 250 scholars and valuable school property; also a kindergarten school with a few score of the younger children, and several private and select schools having from half a dozen to a score of pupils each.

"At Laramie City the Sisters of Charity have an academy with 100 or more scholars, and appropriate school property of their own (they also have an extensive hospital for the sick, at this place), and, as at Cheyenne, select and private schools are also taught.

"Other places throughout the Territory have schools, other than public, according to the size of the city or town."

SCHOOL LANDS.

Governor Moonlight, in his report for 1887, in common with other Governors of Territories, calls attention to the circumstance that the school lands set apart by the General Government are not yielding any revenue for school purposes, although largely utilized for agricultural purposes by persons who occupy them free of rent, after fencing them in. The Governor makes the following recommendation:

"An act of Congress, authorizing the boards of county commissioners of the various counties, under the direction of the Commissioner of the General Land Office, to lease the school lands in their respective counties, for a term of years, and the proceeds to be applied to the support of the common schools of the respective school districts, pro rata, according to the number of school children in each district, and by the Territorial superintendent of public instruction, would be the greatest boon which could be conferred upon the people of the Territories, and the greatest blessing which could befall the children. Those leasing the lands should be required to pay in advance to the respective county treasurers, who would be required to transmit the same to the Territorial treasurer, from whom it should be drawn by the Territorial superintendent of public instruction for distribution among the school districts. The leases should be made to expire at the close of the year in which the Territorial government terminated. The act of Congress could fix the minimum price for the three classes of land to be leased, viz, uplands, second bottom, and bottom or meadow lands; could prohibit the cutting of any timber for any purpose; prohibit the quarrying of rocks of every description, and the taking out of any coal, mineral, or other valuable deposit wherever found. Thus the lands would lose none of their original value, and in many instances would be made more valuable. Within the limits of the railroad-grant lands many of the school sections are now fenced in and used for grazing purposes and for the production of hay, which brings in no revenue to the Government and no addition to the school fund, and upon which the parties pay no taxes.

"An act of Congress placing these school lands in the hands of the county boards would create a local power and a local pressure, which would compel the parties having the lands fenced to pay a reasonable annual rental to the support of the public schools, or tear down their fences so as to give others a chance who were willing to pay. The whole tax-paying population, outside of some of those holding the lands, and they are by far the fewest in number, would become the friends and allies of the Government and the law, and would force a compliance to the very letter. The land in Wyoming is being rapidly taken up, and of course the best land is usually the first taken. It is very likely that many of sections 16 and 36 have prior claims, and that many are deficient in area, and many others are so located as to be of almost no value, and as the law authorizes the selection of indemnity sections to be certified by the Commissioner of the General Land Office to the State, it seems to me that the interest of the common school fund would be best served by permitting this to be done during the Territorial form of government through the surveyor-general of the Territory, the registers and receivers of the land office, and the Territorial superintendent of public instruction. This would make it possible to select some of the good lands as indemnity before they were all taken up, and locating within each county its proper proportion. I am informed that the Wyoming Territorial lines cut through townships so as to deprive the Territory of some 440 school sections.

"The Yellowstone Park, the military reservations, and the Indian reservation deprive the Territory of about 200 more, and it would appear but just that the indemnity sections be given in lieu thereof before all the desirable land shall be taken up. The granting of the power to lease these lands would prevent the possibility of any monopoly control, as the people are keenly alive to the interests of education, and will sacredly guard and protect the common school fund, to supply which all are taxed. In this age of enlightenment it is apparently anomalous that the Territories can not share the advantage equally with States of leasing their school lands, and at a time when this advantage would be most serviceable to them. I have made these suggestions with some diffidence, but believe they are worthy of a careful consideration."

CHAPTER IV.

DISCUSSIONS OF EDUCATIONAL QUESTIONS, CHIEFLY BY STATE SUPERINTENDENTS.

Administration—Censuses, school—Co-education—Compulsory attendance—Country schools—Education, nature and objects of.—Graded schools—High schools—Hygiene—Libraries for schools—Public schools—Religious and moral training—Revenue—School-houses—School systems—Statistics of education—Supervision—Teachers—Temperance instruction—Text-books.

I.—ADMINISTRATION.

The unwisdom of the district system illustrated.—Superintendent Kiehle, of Minnesota: "Noticing the defects of our system more in detail, I call attention to the common school district. This may be known as the neighborhood plan, in which as many families as can conveniently send to one school have their own officers and school-house, and tax their property for the education of their children. This plan prevails nowhere but in the country, although it is not a whit better adapted to it than to cities. The unwisdom of this plan would be fairly illustrated if our cities should adopt it, and provide by law that every one, two, or more blocks might organize for the support and control of their school affairs by a separate set of officers. If the two cities of St. Paul and Minneapolis should adopt the plan of the country, they would support over 500 districts and over 1,500 school officers; there would be some very rich districts, with excellent schools supported at trifling cost, and there would be other very poor districts, with few children, poor schools and short terms, maintained at a burdensome expense. And this is the precise condition of things in the country. Some districts are large, rich and thriving; others are poor, sparsely settled, have few children, and can hardly support a four-months school by levying the highest tax allowed by law.

"There is no more reason for having a set of officers for each school in the country than there is for making as many separate districts in a city as there are school buildings. The same rule should govern in the country that governs in cities. As the territory of the municipality is the territory of the school district, so the township should be the school district in the country; and as in the city a single board provides school privileges as they are needed, so in the township, under one board, school-houses should be located, teachers employed and all conveniences provided as the distribution of population and the progress of the children may require."

Evils of the district system in Arkansas.—Superintendent Thompson, of Arkansas, renews his recommendation of a change to the township system, and says: "After two more years' experience with the present law I am more firmly impressed with the wisdom of the change recommended in 1884. * * * The present plan of separate, independent districts divides the funds into such small parts, that the length of the school term is reduced to the minimum, and to maintain a school for three months it is necessary to employ the cheapest teacher. The school buildings are uncomfortable and poorly furnished. Some are even without any conveniences. This is the school the directors are forced, for want of means, to give the children in their districts.

* * * * *

"Another reason for changing to the township system, is that under our statutes separate schools must be provided for whites and blacks. In some districts there are only five or ten children, for whom a school must be provided at a cost of from \$25 to \$40 per month. In the township system in the northern part of the State, schools could be maintained at much less cost for the few colored children who are in the township. The same conditions are found in many districts in the eastern and southern portion of the State, where there are not more than five or ten white children. There is an imperative necessity for a change, if we expect to advance our schools to that degree of usefulness that is desired and demanded by the spirit of the age."

Not a mere passing notion.—Superintendent Raab, of Illinois, in renewing his recommendation for a change to the township system, says: "It is not a mere passing notion which prompts me to urge this matter of school administration, and to ask such a sweeping modification of the existing laws, but an earnest desire to help to simplify and improve the school affairs of the State causes me to again propose a measure, which it becomes the more difficult to carry into effect the longer we wait. I mean the change from the present district system to the township system in school administration."

Advantages of the township system.—The following synopsis of the advantages of the township system is given by Superintendent Thompson, of Arkansas:

- "1. The building of better and more convenient school-houses.
- "2. The schools could be classified and graded with more ease.
- "3. Better teachers would be employed.
- "4. School terms would be longer.
- "5. Taxation would be equalized.
- "6. The school revenues would be more equitably distributed.
- "7. Equal educational privileges could be extended to all parts of the township.
- "8. Children could attend the school that was most convenient.
- "9. School-houses would be better furnished.
- "10. The *per capita* cost of education would be diminished.
- "11. There would be but little uncertainty about district boundaries.
- "12. Reliable statistics and information could more easily be obtained.
- "13. There would be better management and supervision of the schools.
- "14. Text-books could not be so easily changed.
- "15. The school law would be simplified and better understood and obeyed."

Consolidation of school districts.—Superintendent Williams, of Delaware: "There can be no reasonable doubt of the practical benefits to be derived from the consolidation of small school districts. In district schools some of the difficulties which are met, and which tend greatly to impede the progress of the schools, are the large number of classes, in one instance numbering as high as 26 in a school of 35 scholars; the shortness of the school terms; the necessity in some districts of employing inexperienced teachers, owing to the small amount of money, and the frequent changing of teachers. These, and many others which might be mentioned, could be overcome by consolidating some districts and establishing graded schools.

"The benefits of the consolidation of small school districts are seen in Sussex County, as the results of the commission appointed by the last General Assembly, and have been found highly advantageous to the cause of education."

Practical results of the adoption of the town system in Vermont.—Superintendent Dart: "At the last session of the Legislature a law was passed requiring all towns having the district system to vote upon the question of abolishing the districts and adopting the town system at the annual meetings in 1885 and 1886; the vote to be by ballot and opportunity to be given for discussion.

"It will be seen from the record that in the 2 years 16 towns voted to adopt the town system, and one voted to return to the district system after using the town system 5 years."

Town superintendent of Bolton, Vt.: "Five years have passed since this town entered upon the town system, and when the people had an opportunity to return to the old district system at the last annual meeting, not a single person, to all appearance, desired to do so. Surely a good argument for the town system, when almost a majority were at first bitterly opposed to it."

Of Middletown: "We note a very decided improvement in our schools under the town system. It is working admirably with us and fast gaining friends. Its adoption by our town is a long step in the right direction."

Of Grand Isle: "The town system has made many friends in this town since we adopted it one year ago."

Of Warren: "This is the first year under the town system, and I am satisfied that after we get settled into business and the people become accustomed to the new way, there will be no desire to return to the old district system with its unequal taxation. We have not had so much friction as we anticipated. Our schools are in better condition than before."

A county system recommended.—Superintendent Lawhead, of Kansas: "While there appears to be some ground for the present agitation demanding the abolition of the district system and the establishment of the township plan, it is questionable whether that plan will be the panacea for all the ills of our school system that its advocates claim. It is true that under our present district system taxation is unequal; the district that is financially weak has, in order to secure anything like equal school advantages, to tax itself almost to the point of bankruptcy. Should the township plan be adopted it would not equalize

taxation fully, while it would create endless confusion in district lines, as no school districts have been so formed as to have their boundary lines conform to the boundary lines of the municipal townships. It seems to me that if we are to destroy our present system of school districts, it would be wiser to resort to a county system, and thereby secure a greater degree of equalization of taxation and at the same time avoid all changes and confusion in the boundary lines of districts. * * * Is there not danger of losing that general interest which we now have under the district system, should we pass to the township system and thereby place the control of our schools in the hands of a few? It seems to me that by a carefully considered law providing for a system of school taxation by the county, and the locating and building of school-houses by the same authority, the burden of taxation could be much more equally distributed, and the school-houses so located as to more fully accommodate the children than by any other system. Such a thing as a district financially weak would be unknown; hence, this man or that man would have no incentive in the way of escaping taxation to ask to be transferred from one district to another."

The district system the best at present for North Carolina.—Superintendent Finger: "The district system is, perhaps, not the best system, but as we have it, and our people are accustomed to it, I think best to retain it, at least for the present. The general machinery of the system is working fairly well, and I suggest only such changes as seem to be necessary in the present condition of public sentiment, and considering the small amount of funds now raised under our statutes."

The State superintendent should be independent.—Superintendent Baker, of Texas: "The superintendent of public instruction is selected with special reference to his fitness to conduct the educational interests of the State. The general public holds him responsible, and it is fair to presume that he understands the duties of the position better than others who give those duties little or no attention. The people impose no higher trust upon the government than the supervision of the education of their children. I hold therefore that the department of education ought to be made entirely an independent one, with a head not subject to the dictation of other officers. The Governor, comptroller, and secretary of state, the officers who compose the board of education, have enough to do to occupy their whole time in discharging the duties particularly appertaining to their several offices, without being called upon to determine the correctness of the rulings of the superintendent of public instruction upon subjects with which they are in no way familiar. Such a power bestowed on a board cripples the influence of the superintendent, and in many instances renders him powerless to amicably settle the most trying differences between inferior officers. The superintendent is selected by the people just as the Governor and comptroller are selected, and there is as much reason for a board to act upon the decisions of those officers as upon the decisions of the superintendent; better reason, if the boards were chosen with reference to their understanding of the matters they were to act upon. I unhesitatingly state that the several boards of education since 1873, notwithstanding they were composed of gentlemen of distinguished ability and upright character, have been potent factors in retarding the advance of popular education and the successful administration of the school law."

Relation between superintendent and school committee.—Superintendent Stockwell, of Rhode Island: "It is extremely unfortunate for the welfare of our schools that, in the development in our State of the work and status of the superintendent of schools, the idea should have been allowed to gain a foothold that the office was in any way independent of the school committee, or that the occupant thereof was responsible to any others than the committee, for the whole theory of the office and of its duties has ever been to make it the medium of the committee's actions, to give opportunity for so unifying and simplifying the work of the committee as to make it more effective in every respect, and thus to afford a constant and suitable medium for the expression of their will.

"We are all aware how long it took to place the selection of the superintendent where it naturally should go, in the hands of the school committee, whose servant he is to be, and who confer upon him every particle of power or influence which he may exert. We have one more step to take before the office is placed in its true position of entire independence from any body or interest, save that to which it is legitimately subject, the school committee. The salary of the superintendent should be fixed by the school committee and paid upon their order, just the same as that of any teacher. In fact, the superintendent is but a principal teacher. Just so far as he fulfils the ideal requirements of his place, does he do his best and most valuable work in teaching, both by precept and by example, the teachers of the town. To thoroughly discharge the duties of his place he must himself be a teacher. It is evident, therefore, that upon that ground alone the school committee are the only authority naturally fitted to determine the value of his services and the rate of compensation. It is to be hoped that the time

is not far distant when this change may be effected and another long step taken in the direction of simplifying our educational machinery and determining more clearly the nature and extent of the responsibility for its smooth and successful working."

II.—SCHOOL CENSUS.

The facts should be made known.—Superintendent Dartt, of Vermont: "It is a matter of regret surely that no provision is made by this State for the enumeration of all the children of school age. If there are those within our borders who are growing to manhood and womanhood without any education, who do not attend school at all, the facts as to their number and where they are should be fully known, that effectual means may be used to remedy this evil and remove the reproach from the Commonwealth."

We should know the facts.—Superintendent Powell, of the District of Columbia: "If education is of value as a factor in society, and if the schools are the only tangible measure of that value, we should know the facts by means of which an estimate may be made, so far, at least, as numbers of children are concerned, of the relations between what is accomplished and what ought to be accomplished."

III.—CO-EDUCATION.

Will become more sensible men and women.—Superintendent Fred W. Campbell, of Oakland, Cal.: "It seems to be the natural order of things that boys and girls should be educated together. They are together in the family, in the relation of brother and sister. In the co-education of the sexes in school, there are secured greater economy in instruction, better discipline, more natural, and therefore more healthful, intellectual, and moral and æsthetic development for both the boys and girls. The mingling of the sexes in the school-room checks the tendencies both to the romantic fancies and overwrought and unreal imaginings engendered by attendance on separate schools; and this it does by substituting for such illusions the every day commonplace reality of mutual rivalry in a common labor. Thus each forms correct and sensible judgments of the other. They learn that they are much alike in their natures, that they possess about the same ability to learn, with nearly everything yet to learn. By so much as all this is the effect of educating boys and girls together, by so much will they become more sensible men and women than by educating them separately."

IV.—COMPULSORY ATTENDANCE.

A proximate and provisional enforcement desired.—Superintendent Akers, of Iowa: "To say the least, there must be a strong presumption in favor of an educational measure in which all the leading nations of the world are enlisted, and which has almost the unanimous advocacy of the teaching profession, and of those public officials who are best informed as to the necessities of the case. In face of this there is everywhere acknowledged difficulty in putting a compulsory school law into force. A close study, however, of this kind of legislation will make two things apparent, both setting aside any objection to the law on the score that it can not be enforced.

"First, wherever boards of education have been empowered to employ a special officer or officers, whose business it should be under some systematic method of search and report, to find out the defaulters and get the children to school, the end contemplated by the law has been gratifyingly attained. It has been suggested that this officer be partly police and partly missionary in his functions, but mostly missionary, as being more in keeping with the kind of work he has to do. And this suggestion brings us to the second most important lesson from the study we have had in hand, namely that for the ends of public well being a proximate and provisional enforcement of a compulsory school law is all that should be desired. In the language of one of our most eminent educators, Dr. Welch, compulsory education should not be reckoned of value simply to the extent to which it can be rigidly enforced, but in the main it should be prized because of the 'compulsory environment' it throws round the ignorant and the dilatory, and the general public interest it arouses in the cause of education as lying also at the very heart of the national life."

The rights of the children should be secured to them.—Superintendent Stockwell, of Rhode Island: "I think the duty of the hour to lie in the direction of arousing and directing public sentiment to demand that the rights of these children, so many thousands of whom are practically dependent on the State for all the opportunity they will ever have, be recognized and secured to them. Our people need to be reminded that these children are the future voters; that in their hands will be placed the destiny of the State, and that we are responsible for the training given both to their hands, and also to the minds and hearts which will control them. We are trifling with tremendous issues, and we shall be fortunate if we do not pay for our folly by some terrible experience. Let us awake from our lethargy ere it is too late."

Reasons of failure in Minnesota.—Superintendent Kiehle: "I am not able to report any substantial aid gained from the law on compulsory education. Several superintendents have undertaken to enforce it, but the results have not been permanent. The reasons of failure have been:

"1. Defects in the law. It very properly allows children to be educated in other than the public schools, yet leaves the condition so indefinite that there is not the least guarantee that the children are receiving the equivalent of a common school education. Whatever else is required, every school which is to be recognized by the law should certify that it is conducted in the English language, and that instruction is given in the branches of a common school education, viz.: reading, writing, arithmetic, grammar, and the geography and history of the United States.

"2. The difficulty inherent in this method of improving the people. The more children there are in any given district who do not attend school, the more probable it is that no one in the district will take the trouble, or endure the odium necessary to the enforcement of the law. There should be a truant officer in the city, and a constable in the country, whose duty it would be to attend to the enforcement of the law."

The best possible compulsory law.—Superintendent Jones, of Dakota: "The law for compulsory education in our Territory, which is intended to be provided for in sections 119, 120, is not enforced. To enforce such a law requires first, that public sentiment be educated up to a proper appreciation of the principles involved. This may yet be in the somewhat distant future so far as it interests those communities which are most negligent. I fully believe that a law which taxes the parent or guardian of every child, say twenty-five cents per week, *per capita*, for all children of school age under his care or control, to be collected as are all other taxes, and the amount collected to go to the support of the schools, would be the best possible compulsory law. The parent or guardian may then receive a credit upon such tax of twenty-five cents, in favor of any particular child, naming it, for each week of school attendance, upon presenting the certificate of the director showing the attendance. But the credits of one child should not be accepted from the parent or guardian in favor of another."

Justification of compulsory attendance laws—Limits of the rights of parents.—Superintendent Hine, of Connecticut: "There are many parents who assert what they call their right of governance. Such think it unjust that they must send their children to school, and thus lose the profit of their labor. Others, timid about interfering with the relation of parent and child, prefer that the child should suffer abuse and deprivation rather than disturb the principle of parental control.

"There is no necessity of confusion or hesitation here. That parents may have the governance of their children is not an unalterable principle upon which unchangeable laws are based. It is only a proposition based upon extensive experience and embodying the general conviction that parents inspired by instinctive love will treat their children wisely and humanely. There is a strong probability that they will so treat them. This presumption of good will yield to a certainty of evil. When it is certain that a parent is injuring his child a point is reached where society says his action is not reasonable, and the law says it is not lawful. It may be unreasonable long before it is unlawful, but it is merely a question of degree when the legal limit is overstepped.

"Responsibility for the education of the child is placed upon the parent. It is admitted that the parent may and ought to understand what is the best education for his own children. But at the point of no education or of limited education resulting in mental starvation, the law undertakes to make the parent do his duty. If in the exercise of his judgment and right of control, the parent gives no education he has overstepped the reasonable limit of control and transgressed the positive enactment. He is now compelled to do what he ought to do.

"Similarly there is no principle which confers upon a parent the right to cause his child to work for gain or for the support of the family. It is supposed that the labor which the parent compels the child to perform will [not] result in good to the child. If the mind or body of the child is injured by work in any industry, the limit of reason is again overstepped, and the law compels the parent to refrain from doing what he ought not to do. Both in depriving the child of education and in causing him to spend his early years in labor the parent is not conforming to what the experience and convictions of society regard as right. He is not acting in a reasonable manner, and the law says he is not acting in a lawful manner.

"The enactments relating to attendance and employment have restrained and mitigated in many cases the harshness of parental control. If they have accomplished nothing more their operation has been beneficial."

V.—COUNTRY SCHOOLS.

A course of study adopted for country schools in Indiana—Classified schools.—In Indiana, under the superintendency of Hon. J. W. Holcombe, a standard course of study for one-room country schools, prepared by a committee of the County Superintendents' Association, was adopted by that body in 1884. From that time a general effort has been made throughout the State to conform the district schools to the standard course. It is divided into three parts, known as the Primary, the Grammar, and the Graduation Divisions.

Diplomas, tastefully lithographed, are granted to pupils who attain an average of 75 per cent. and who do not fall below 65 per cent. in any one branch. The graduating exercises are held in each township under the supervision of the county superintendent; these have been attended with a degree of interest far beyond expectation.

Following are the courses of study referred to above, and a daily programme of study and recitations for a district school. The word *year* is used somewhat indefinitely in the arrangement of the work, and does not mean necessarily either the calendar year or the school term (since the latter is not uniform), but rather such a time as is necessary for the completion of the work allotted—in other words, the interval between the promotions.

COURSE OF STUDY ADOPTED FOR ONE-ROOM DISTRICT SCHOOLS OF INDIANA.

PRIMARY DIVISION.

First grade—first year.

Spelling.—All the words of the reading lessons by letter and sound.

Reading.—First reader complete; introduced by the word, in conjunction with the object method, afterwards combining phonic method.

Writing.—Blackboard and slate exercise.

Arithmetic.—Adding 1's, 2's, 3's, and 4's. Roman numerals; Arabic numerals.

General lessons.—Language lessons in connection with reading. Object lessons—color, orm. Geography—distance and direction.

Second grade—second year.

Spelling.—Written exercises, slate, board, and spelling tablets.

Reading.—Second reader completed.

Writing.—A complete drill on position at desk, as to pen and movement and form of letters.

Arithmetic.—Oral lessons, addition, subtraction, multiplication, and tables constructed as far as learned.

Geography.—Home—outline of township, county, and State.

Language.—Lessons in connection with reading, notation, and numeration.

Third grade—third and fourth years.

Spelling.—All the words of importance in the various lessons; new words defined, spelled by sound and letters, using proper diacritical marks—slate and blackboard.

Reading.—Third completed.

Writing.—Copy-books Nos. 2 and 3. Special attention given to position, holding pen, movement, etc.

Arithmetic.—Addition, subtraction, multiplication, and division, mastered as principles without the use of text-books.

Grammar.—Oral language lessons; analysis by diagrams, giving subject, predicate, object, and simple modifiers.

Geography.—Oral lessons, by subject, to primary geography.

History.—Oral lessons; important events and dates. (Occasional.)

GRAMMAR DIVISION.

Fourth grade—fifth and sixth years.

Spelling.—Same as Third Grade.

Reading.—Fourth completed; supplemental reading introduced.

Writing.—Copy-books Nos. 4 and 5.

Arithmetic.—Practical, to percentage.

Geography.—Primary.

Grammar.—Elementary, completed.

History and Physiology.—Oral lessons.

GRADUATION DIVISION.

Fifth grade—seventh and eighth years.

Spelling.—Previous methods continued.

Reading.—Fifth completed; suitable supplemental reading.

Writing.—Adopted system completed.

Arithmetic.—Completed, giving special attention to analysis and formulas.

Geography.—Completed; map drawing and physical conditions mastered.

Grammar.—Completed, including a practical knowledge of composition and analysis by diagram.

History and Physiology.—Completed; civil government.

Special.—Familiar lessons or tasks in elementary science, and a practical knowledge of the United States system of land survey.

Daily programme of study and recitations for a one-room district school, State of Indiana.

Hour.	Time.	First grade.	Second grade.	Third grade.	Fourth grade.	Fifth grade.	Summary of recitations.

Black Type denotes recitations.

Plain type denotes study.

"Additional branches" before 9 a. m. or after 4 p. m.

The following is an extract, relating to the above course of study, from a circular letter of State Superintendent Holcombe to township trustees and school boards: "All the one-room schools of a township should follow the same course of study, covering the eight 'common branches,' and not attempting to go beyond these unless additional branches are demanded by patrons, according to law. Schools of two or more rooms should divide the grades between the departments, and introduce additional branches in the highest department, as far as facilities permit.¹ Pupils should be classified in the course of study according to their advancement, and should be carried through it to graduation, and no pupil should be permitted to graduate until he has studied all the common branches. Trustees have the power to require pupils to follow the course of study, and no pupil should be excused from any subject appropriate to his advancement except by special permission of the trustee for good cause."

INDIANA DISTRICT SCHOOL DIPLOMA.

The form of diploma generally used is as follows:

<p>INDIANA COMMON SCHOOLS</p> <hr style="width: 20%; margin: auto;"/> <p>COMMON SCHOOLS [INDIANA] THE HOPE OF OUR COUNTRY.</p>		<p><u>DIPLOMA.</u></p>

Remarks on the classified country schools of Indiana.—At a convention of the county superintendents of Indiana, Superintendent David N. Nelson, of Jasper County, made the following criticisms and suggestions regarding the course of study and programme of recitations, etc., given above:

"The uniform course alluded to above is excellent, and with slight modifications may be operated in every county in the State. Its adoption should be made uniform at once. But a clear view of the characteristics of such a course is necessary to our purpose.

"I. The course should state clearly and definitely the work intended.

"II. This work should be divided into parts, and a definite time allotted for the completion of each part.

"III. These parts should be arranged in their logical and psychological orders—considering the parts themselves, in the order of dependence; considering the relation of these parts to the child, in the order of mind-growth.

"Confusion very often arises from the fact that teachers do not know what work is required of them. The course is not specific. Details are not outlined, and the work is stated only in general. It must be remembered that the district school is not subject to the same close supervision that is found in the city and town. There the superintendent

¹An account of the Indiana graded school system is given in another part of this Chapter. See p. 188.

outlines the work in detail from month to month, and if any doubt exists in the teacher's mind it may at once be removed by consulting the competent, responsible head, whose thought is being worked out in each department. In the county in which I live, some teachers are at work in the school-rooms 25 miles from the county seat, and many times during the winter 35 miles from the superintendent. A question arises as to what work is to be done. It cannot be settled for weeks and perhaps months, when the emergency is passed and the question forgotten. In the mean time the teacher proceeds as best she can without the stimulus of settled convictions, and does an inferior kind of work, of an entirely different character from that intended and from what is being done in an adjacent school. This is not confined to Jasper County. A similar circumstance within a few miles of the centre of this city came under my observation within the last school year. Again, it is true that the teachers most competent in carrying out a system of instruction find their way into the cities and towns, where they have less exposure and greater conveniences, where there are more opportunities for promotion, and where the wages are higher. These two discriminations against the district school make it necessary that the course of instruction in the country be more definitely and explicitly stated than in the towns and cities. My observation has been that the reverse is generally true. The course in the district schools should be outlined in detail, making it easy for pupils and parents to understand, and thus aiding in its enforcement.

"Under our present school laws it is impossible for our schools to continue in session during the entire year, and with the present amount of labor and confinement required each day of the pupil, such long terms are not desirable. As the time for study is divided into parts, there should be corresponding divisions in the course of study, *i. e.*, a definite portion to be accomplished each year. How much can be done in each of these divisions of time depends mainly upon three conditions:

"I. The length of school each year.

"II. The efficiency of teachers.

"III. The regularity of pupils.

"If these three points be properly regulated, the problem of uniform gradation is easily solved. In them we find the greatest tendency to disintegration, and, consequently, the greatest obstacles to be overcome. In the consideration of these points we shall find many difficulties to be removed.

"The length of term in the various counties of the State varies widely. The longest for the year 1883 was 180 days; the shortest, 93 days. The longest for the year 1884 was 172 days; the shortest, 77 days. Between the townships of most counties a like contrast appears. In my own county, in 1883, the term was 62 days in one township and 140 in another. In 1885 the shortest term was 80 days and the longest 135. Under these circumstances, with equally good teachers in every school, nothing like uniformity in gradation can be maintained. Some pupils will complete the course in one-half the time it requires others to complete it; or one pupil will do double the work of another in the same number of years. The course, therefore, which is adapted to one school is not suited to another, perhaps within the same county, to say nothing of remoter parts of the State, where different industries and physical conditions may hold trustees within still narrower limits. Nor does the remedy lie within the reach of all. In many counties the county board can arrange the local levy for tuition in such a manner as to produce uniformity of terms in that individual county. This will greatly assist in gradation, and where it is possible it becomes the imperative duty of the county board and superintendent to see that it is speedily done. But in other counties, if the levy be made to the greatest extent authorized by law, the longest term will be only 135 days, while the shortest will be 80 days. In this case the only way to equalize is to reduce the maximum length to the minimum. This would be unjust and exceedingly impractical. The only remedy here lies in new legislation.

"All teachers are not equally skilful in the management of their schools. One teacher will accomplish as much in 6 weeks as another in 4 months. This, added to the fact that the poor teacher falls heir to the short term, seriously disorganizes the work, for the good teachers, with the long term, can do at least four times as much work as the poor teachers with the short term. Again, teachers seldom succeed themselves from year to year, so that good and bad ones alternate, and, like positive and negative quantities, mutually destroy each other's influence. To avoid these evils is the desideratum. If the teacher is inefficient, all fails—course of study, classification, methods of promotion, systems of instruction, all fall to the ground. The county that would carry into effect any settled line of policy, which is absolutely essential in order to sustain a system of graded schools, must employ teachers who have made some 'special preparation for the work, and who are reasonably familiar with the principles which must be observed in the formation and preservation of a graded course of study.'

"The grades in the district schools are subject to disintegration from another cause—irregularity in attendance. Where no system of reports is used superintendents and school

officers generally are not aware of the enormity of this evil. Few parents understand that they have no right to detain the pupil at home; and long, muddy roads, inefficiency of teachers, impossibility of close supervision, all operate against the school in this respect. Jasper County, being one of the largest in the State, has suffered loss from each of the causes just enumerated. Last fall, during the first 3 months, only 70 per cent. of the enumeration enrolled, and 79.6 per cent. of the enrolment, attended every day. During the succeeding 3 months the attendance was considerably less, owing partly to the severity of the winter. I do not think these figures below the average, but that a like relation holds in other counties as well. In nearly every school are to be found a class of pupils who enter late in the fall, quit early in the spring, and are absent 1 or 2 days each week in the meantime. This destroys the classification, and where any considerable number are of this character, renders gradation well nigh impossible. If we carry into effect any system of gradation, we must secure the regular attendance of the pupils.

"Any course of study must be arranged in accordance with two things—first, the organic relation of the branches and different parts of branches taught, and second the order of mind-development. These are co-ordinate thoughts, and are each primary. Studying history, geography, and arithmetic—in fact all study—is but discovering the relations which exist in the great order and system of things called nature, of which our minds, bodies, the earth, and all organized and unorganized beings are but parts. Nowhere in this domain is the rule of chance, or caprice; all is system. Certain things necessarily condition others, and render them possible. What is meant by arrangement in the 'logical order' is simply that the order which nature has established in the constitution of the thing should not be violated. The discovery and statement of these relations would form an excellent theme for an hour's discussion, and cannot be attempted here.

"In this day, when psychology is the hobby in education, it has come to be understood that even mind is a part of nature, and that it, too, acts within the domain of law. That under all the phenomena of thinking, feeling, and willing, there are unchanging laws whose actions are in harmony with each other and with things. This harmony, adaptation, or fitness, is universal. The mimicry of the tiger adapts it to its native jungle; the eye is adapted to the beautiful green of earth and blue of sky, the ear to the vibrations of the air. So also the mind, in its secret constitution and working, is adapted to the other departments of nature which it must apprehend or know. As nature is always harmonious with itself, it follows that the mind must know things in their necessary and inevitable relations, and thus it is seen that the logical and psychological orders coincide and are the same. That this should be the arrangement in any system, whether graded or ungraded, is beyond question. That a *graded* system should be arranged so is doubly important, since the tendency to disintegration in any organism increases with its complexity, and since only by such arrangement can its harmonious operation be secured.

"This brings us to the second branch of our subject—the classification of the school according to the course of study. Here the work before us is to give each pupil his proper work by placing him in the grade to which he belongs. It is a fact that in all schools the size of the classes steadily decreases as we pass from the lower grades to the higher. This is shown in both town and country, by the small number of pupils in the graduating classes as compared with the number that are doing first-grade work. Since this is so, a larger portion of time should be given to the lower grades of the school. Again, the time allotted for the completion of the course of study is 8 years. Each year brings new accessions to the school, and as these pupils are 1 year behind, it seems that the most natural division of the pupils is into 8 grades. But such a division in the district school is altogether impracticable, as it would necessitate at least 32 recitations daily. This would so divide the time of the teacher that but little would be accomplished. It is absolutely necessary, then, that in our district schools certain of these years be combined in the formation of the grades, and since the number of pupils decreases as we advance, these combinations must be made in the last years of the course. Thus, in order to decrease the number of classes, the years are combined as follows:

- "(a) First year pupils are kept by themselves.
- "(b) Second year pupils also form a grade.
- "(c) Third and fourth years are placed together.
- "(d) Fifth and sixth years are placed together.
- "(e) Seventh and eighth years are placed together.

"With this arrangement all the pupils of the school are classified into five grades. On an average each grade may have five recitations daily, without frittering away the time of the teacher, and with very satisfactory results. More recitations than these are not advisable. Several points require special attention just here:

"I. With such an arrangement, how are promotions possible without destroying the classification of the school? Here is a most difficult question. If a difference of one year only existed between the grades, or if pupils were admitted to the school only once in two years, it could be easily answered. No trouble is found in promoting from the first to the second grade; but it is observed that when they pass from the second to the third grade, they must combine with pupils who have already done one year's work on that part of the course allotted to the third grade. This, of course, where everything has been efficiently done, works detriment to the school. Were it not that the logical and psychological orders, stated above, must be followed on passing to the third grade, they could commence fourth year work, and the following year do third year work, and again the two divisions would combine at the beginning of the fifth year. With this arrangement the class that enters the school in the odd years would progress evenly and symmetrically through the entire course, while the class that enters on the even years would work half the time with the class which is a year ahead, and the other half the time with a class a year behind its true standing. This is out of the question, and the close and rigid gradation here spoken of is impossible. The most practical way seems to be to make the gradation loose, to allow the bright, strong ones to pass on to a higher grade, while the dull, weak ones fall back where an opportunity is given to make up lost work. Some difficulty is experienced here, owing to a difference of advancement; but it is hardly to be expected that the pupils of any grade will be of the same degree of scholarship.

"II. When new pupils present themselves, how shall they be classified? Three things should be taken into consideration—age, ability, scholarship. Other things being equal, such a pupil should be placed among those of his age. If ability is good and scholarship somewhat less, he should be *still* placed there, allowing that with his good ability he will soon 'catch up' with those of his own age. In deciding upon scholarship, *reading* should be made the basis for classifying primary pupils, while *arithmetic* is a more satisfactory basis for classifying advanced pupils. It is always best to place a boy of good ability among his superiors than among his inferiors. Care should be taken, however, not to class him so high as to make a change necessary.

"III. Whose duty is it to classify, and is this duty imperative? Manifestly the pupil is not prepared to choose his studies or classify himself. He sees the school from below, not from above. He looks upon the school as an end in itself, and is not expected to know what constitutes the best and most rapid progress. Neither can his parents decide the question of his classification; for if they do, decisions will conflict and again classification is impossible. Certainly it is the duty of the teacher, acting under the direction and supervision of the county superintendent. This is an imperative duty upon the teacher, one that he should discharge without fear or favor. 'Where does the pupil belong?' is the question, and his 'duty to the child, to the parent, to himself and to his profession, demands a correct classification.' It is my opinion that, in the first place, teachers do not sufficiently understand the principles of gradation to act with confidence and decision; in the second place, they do not understand it to be one of their sacred duties; and in the third place, they fear the opposition of parents. The unpopularity which a teacher is likely to incur by assigning the pupils to the classes where they really belong, acts as a powerful barrier against the gradation of our schools. This is its negative phase; its positive phase, though not so generally practiced, is another great evil. Teachers will curry favor with parents and seek popularity by classifying pupils too high. Such work has been appropriately termed 'demagogic pedagogy,' and has been characterized as a base, unprofessional trick. A great duty devolves upon the superintendent in properly directing the work of his teachers in this respect; also in visiting his schools the work of classification should be carefully inspected.

"IV. Uniform text-books are necessary. This is absolutely essential, in order to prevent the multiplication of classes. The means of accomplishing this are in the hands of the county board, and should be exercised with great care.

"V. The necessity of a suitable programme. It is not the purpose here to state what the programme should be—to decide whether arithmetic or reading should come first in the day, but to determine some of its characteristics and show its value in sustaining a graded system of schools. The programme should state a time for each exercise of the school; thus none will be omitted, none forgotten, and irregularity in this respect is avoided. It should also state the *length* of time for each exercise; thus none will usurp the time of the other; none will be slighted. A properly arranged programme is absolutely essential in securing these two results; and though they may seem little things, their violation has a powerful tendency to disintegrate and disorganize. A lack of method and system here rapidly spreads until it infests every thread and fibre of school work.

"Having arranged a course of study and decided upon the classification of the school the promotions naturally follow. These have already been incidentally noticed under the head of 'Classification of Schools,' but a few points are deserving of special mention. Any perfect scheme of promotion necessitates—

"I. A standard which must be reached.
 "II. An accurate, just, and uniform method of determining the standing of pupils.
 "III. A permanent record of this standing for the use of school officers and succeeding teachers.

"IV. A system of graduation.

"Only those pupils should be allowed to pass whose work has been good, and a high degree of excellence should be required. Teachers and school officers fail, many times, by lowering the standard of scholarship. Thus pupils come to believe that accuracy is not desirable, and that hard work and faithful effort are not essential to success. Seventy-five per cent. at least should be the minimum in any branch. A higher standard would be still preferable. This standard should be determined by the county board.

"That the standing of pupils should be made up from both the class work and examination will hardly admit of question. Baldwin, in his 'Art of School Management,' recommends that the class-standing be multiplied by 4 and the result added to the grade received on examination, and that this sum be divided by 5 in determining the standing of any pupil. This method seems eminently just. But while teachers differ so widely in their methods of grading, and while such a difference exists between the questions used by one teacher and those of another, uniformity is not so easily secured, and pupils of one school advance more rapidly in the grades than those of another. The difficulty here again grows out of the impossibility of close supervision. Two plans for unifying the work may be suggested:

"1. The township plan, in which the work of preparing questions for examinations, grading manuscripts, and controlling promotions is in the hands of a township principal, who in turn works under the supervision of the county superintendent.

"2. The county plan, in which the superintendent prepares the questions for each school at least twice a year, and collecting the manuscripts, grades them himself. This entails an almost endless amount of work on the superintendent, but it has been successfully accomplished, I understand, in at least one county of the State. Either method if taken would greatly aid in establishing the fixed policy necessary to gradation.

"The status of a school being once determined for a given month it should become a matter of permanent record, so that school officers and succeeding teachers may have something to assist them in maintaining the gradation of the school. Each teacher should be supplied with a grade-book, with definite instructions as to its use, where the standing of a pupil, made up as suggested above, should be recorded monthly and in permanent form. At the close of the year a summary of these monthly standings should be made and the averages given. This average standing should reach the standard already adopted by the county board before a promotion takes place. Where a township principal is employed, as stated above, he should have a record of the name, classification, and standing of every pupil of the township. Where no such principal is employed the county superintendent should have a similar record made from the monthly reports of his teachers. These records should be summarized and published for annual distribution to teachers and parents.

"Graduation is the last step in promotion, and is essential. No greater impetus has ever been given to the work of the district schools than that which has attended the introduction of this feature. It, like Janus of old, looks both ways, forward, backward—backward over the entire school course, and necessitates efficiency at every point. It is destined to work a revolution in that it strengthens the work all along the line. It secures better instruction, better gradation, closer supervision. It looks forward to the high school, to which its diploma is a ticket of admission. It thus unites the district school and the high school, and as it marks a degree of success, is a powerful incentive to good.

"To recapitulate: The essentials to gradation are course of study, classification, promotion.

"The course should state the work in detail, should divide it into parts and allot a definite time to each, and should arrange these parts in their logical and psychological orders. The course for the district schools should be more definitely outlined than that for towns and cities. The amount of work that can be done in a given time depends mainly upon length of term, efficiency of teacher, and regularity of pupils. The logical and psychological orders are the same, and are the inherent relations of the mind and the thing studied.

"Only five grades are practical. Classification should be loose; new pupils classified according to age, ability, scholarship. It is the duty of the teacher and the superintendent to classify. Uniformity in text-books is necessary; programmes are essential.

"Any scheme of promotion includes standard, test of scholarship, permanent record, system of graduation."

What the ungraded school demands.—Superintendent Raab, of Illinois, in speaking of the qualities demanded of the teachers of ungraded schools, remarks: "Every one can

see that to instruct 30 to 40 pupils of such various attainments as the difference in the ages between 6 and 21 years conditions is a difficult task, and that the teacher must possess a high degree of self-denial and energy to do this work well. He must occupy silently three or more divisions while he instructs one. In order to make this silent occupation of use to the pupils, how carefully must the exercises be selected, how well prepared beforehand, and how much time does their control and criticism consume? How must the teachers continually study the means of doing the work most thoroughly in the shortest possible time? It is self-evident. *The ungraded school demands the most skilful and thorough teacher and educator.*

"The communities with ungraded schools are mostly far removed from larger towns and cities. Their inhabitants belong mostly to the less wealthy and cultivated. Not rarely there is a lack of intellectual incitement and æsthetic refinement so essential for a young person to feel and imitate. Frequently the few refined are too far removed socially from the majority to encourage intercourse between them. A teacher who is to work in such a community has great difficulties to overcome socially. His education may predispose him for the intercourse with the few cultured families, but he is rarely in such pecuniary situation as to mingle with them freely, socially, and familiarly. For the sake of his efficiency he can not withdraw from the society of the majority. Much tact and a strong character are necessary to do the right thing under all circumstances; to displease neither the one nor the other. The teacher of an ungraded school must not only be a thorough teacher and educator, *he must at the same time be a man of wisdom and of character.*

"But what kind of a teacher do we find in many ungraded schools? Young people just dismissed from the same kind of school. What is the cause of this? Because this class of school is considered the proper one for the beginners and it is the most poorly paid. When the latter have instructed in such a school for some time they either strive for a village school or they abandon the work of teaching altogether and other tyros take their place.

"These young people enter upon their duties and find themselves before a gigantic task. Hardly any one of them has ever seen a school properly conducted; some will perhaps remember one thing or another from their childhood experience.

"Many a one would find it a difficult task to instruct one division properly and to gain its attention and interest, and now he is called upon to employ four or more divisions at the same time. If he loses all hope and grows dispirited is it to be wondered at? It is a wonder if he does not lose courage and succeeds in creating order and fresh life out of chaos."

"As a rule there is little enthusiasm among the teachers of ungraded schools. How can there be any as long as the teachers do not know or even feel what great opportunities for doing good to their fellow men are put into their hands. Instead of creating fresh life and vigor they consider their work a drudgery from which to flee as soon as there is a chance seems natural. They know no better. No one has ever opened to them the portals of science or pointed out the blessings which may be conferred upon a community by conscientious, thorough work in ungraded schools.

"School directors having charge of ungraded schools should never employ teachers who have not at least served an apprenticeship of several years in a graded school under the supervision of a competent principal or superintendent. The salaries of teachers in ungraded schools should, of course, be much better than those of subordinate teachers in graded schools. Teachers who have successfully taught in ungraded schools will form the best material from which to select principals and superintendents for village and city graded schools, because they are familiar with all the details of the entire course from the primary grade to the high school.

"A public school teacher, especially the teacher of an ungraded school, who successfully leads the young to the high aims of intellectual and moral culture, is certainly one of the most useful servants of the State; hence the community should do everything in its power to retain the greatest possible number of such men in the profession and to secure to them satisfactory and respected positions."

Grading country schools.—Superintendent Cornell, of Colorado: "Our country schools cannot be made as thorough and efficient as they should be until a definite course of study is adopted and the pupils classified. * * * If the country schools are graded the work must be accomplished largely through the efforts of the county superintendents. They must see that the teachers properly classify the pupils of such schools, and keep proper records of such classification. From these records the teacher should make monthly reports to the county superintendent, which shall show the progress of the school. The mere adoption of a course of study by a school board will avail but little unless some system is inaugurated for having it carried out and made permanent. It is not expected that any one course of study can be adopted in detail in every school. County superintendents must determine what course is best suited to the schools of their coun-

ties. Yet, if possible, it will be better to follow one general outline of work in every county."

A system of grading proposed for Kansas.—The subject of grading the common schools of Kansas has been recommended by Superintendent Lawhead to the consideration of the Legislature of that State. The objects to be sought and some of the advantages that would result he enumerates as follows: "(1) An ultimate reduction in the number of classes, consequently more time could be given to each class. (2) More systematic work could be done, hence each pupil taught by example the necessity and practical benefit of system in everything—a very important element. (3) Each pupil would realize that his advancement would depend upon the thoroughness with which he performed his work, therefore he would be stimulated to do everything in the best manner possible."

Organization of ungraded schools.—Hon. John W. Dickinson, secretary of Massachusetts board of education: "A serious hindrance to successful work in ungraded schools is a large number of classes. A large number of classes seems to make necessary many exercises during each daily session. Where there are many different class exercises in the day but little time can be given to each, and with but little time for an exercise, not much good teaching can be done.

"Just as good teaching can be done in an ungraded school as in a school that is graded, and it can be done in the same time and in the same way.

"It seems desirable, therefore, that an earnest effort should be made by the committees and teachers having these schools in charge to make the number of daily exercises small enough to make good teaching possible.

"This may be accomplished in the following way:—

"*First.* By uniting as far as practicable the classes in each subject.

"The course of study [for ungraded schools in Massachusetts] is laid out for eight years of school attendance, but there are few schools in which all these grades of work are represented at one time.

"By the use of supplementary reading matter, and by the topical method in other subjects, classes representing different grades may be brought together.

"*Second.* By alternating the recitations of the older pupils in certain subjects. Thus the recitations in geography and history may occur on alternate days; so may physiology and grammar; writing and drawing may alternate. The reading exercises of the higher classes may alternate with each other.

"*Third.* By frequent and regular substitution of written for oral recitations in most of the subjects. This will leave the teachers free for other classes, and the written papers can be examined out of school. Such exercises are of great value to the pupils themselves.

"A written programme should be prepared as soon as possible after the beginning of the term. This should contain the order of exercises for each day of the week, and should indicate the time at which each exercise should begin and end. It should be placed where it can be read by the pupils, that they may be guided in their study. If rigidly followed by the teacher it will train the pupils to habits of promptness and punctuality."

VI.—EDUCATION.

A man of more account than his trade.—Superintendent Hinsdale, of Cleveland, Ohio: "One of the most discouraging things that the teacher encounters is the erroneous views of the nature and objects of education that are so very common. An intelligent manufacturer tells me, for instance, that he is anxious to find out as speedily as possible what trade or profession his son is fitted for by nature, and then to educate him to follow it. He says he can see the sense of a classical education for a minister or a physician, but evidently it would be thrown away on a mechanic or tradesman. No doubt it would be folly to give, or seek to give, a classical education to all mechanics and tradesmen, or even to many of them. But that is not the point. After all the preaching of 'sweetness and light' we have heard the number of people who can not raise the question of a boy's education above the level of the daily work that he will probably perform is alarmingly large. These people think a man is merely a tool or instrument, and that he should be educated solely for the reason that a chisel or saw should be kept sharp. Now, it scarcely need be said that education should fit men and women for efficiency in work and business. Life has a physical basis; a man can do nothing without his breakfast, and a complete scheme of education must provide for bread-winning. How a boy or girl will be best prepared in school to earn money, and so to win bread, whether by general studies, by special studies, or by a combination of both, I do not now inquire. But I do assert that a man is of more account than his trade. The life is more than meat, and the body than raiment. Man lives not by bread alone; his life consists not of the abundance of the things that he possesses. The human mind is capa-

ble of knowledge and of seeking truth for truth's sake; capable of sublimity, faith, reverence, sympathy, and pathos; capable of happiness and joy and love, and to deny it the food that feeds these capacities, to try to appease its hunger with a mere business education, or with the husks of learning, is nothing short of starvation."

VII.—GRADED SCHOOLS.

THE INDIANA SYSTEM OF GRADED SCHOOLS.

The State of Indiana furnishes a typical illustration of the American system of graded schools in its fullest development, in which every child may receive an education at the public expense, beginning with the rudiments of learning and continuing on by successive steps up through the highest grade of the university. State Superintendent J. W. Holcombe, in his last published report, gives an account of the system as it has been developed in Indiana, from which the following has been compiled.

What the term "graded school" is understood to mean in Indiana.—State Superintendent G. W. Hoss (1865), in interpreting the provision of the statute regarding graded schools said: "1st. A graded school is a school in which the pupils are placed in different rooms and under different teachers according to advancement. Consequently, the greater the number of rooms and teachers for any given school the more favorable the means for perfect grading. From this it will be seen that a graded school as contemplated in the above section can not exist with less than two teachers. With one the school may be classified but not graded. Trustees will therefore have regard to this element when they put up buildings designed for graded schools. 2d. As to the time when a graded school should be established for any given township, no definite directions can be given. There are too many local elements to admit of any special directions. It is, however, safe to say that whenever there are pupils in the township whose advancement is such that the district schools can not furnish them instruction, at that moment begins the need of a township graded school furnishing instruction of a higher grade. The trustee must, however, be satisfied that the number of such pupils is sufficient to justify the establishment of such a school before providing the same. 3d. As to place, I would suggest that whenever practicable the township graded school should be established in connection with a district school, thus economizing in building, perhaps in teaching, also furnishing the means of a more thorough grading in at least one primary school in the township. It is suggested further that a village, if centrally located, is usually a favorable place for the township school."

"A graded school, it is therefore obvious [Mr. Holcombe says in continuation], may be extended from the smallest township school of two rooms, carrying its course of study no farther than 'the eight branches,' or including but one or two 'additional branches,' to the highly developed city system, which embraces elementary instruction in the higher mathematics, languages, literature, and science. The graded school develops as the population increases and as the demand for higher instruction grows. The cities, therefore, first established graded schools, and have, as a rule, extended their system in proportion to their size and wealth. All the cities of the State, and most of the towns, maintain graded school systems, terminating in a high school course of from two to four years."

The course of study.—The law determining the subjects of instruction in the common schools of the State is as follows: "The common schools of the State shall be taught in the English language; and the trustee shall provide to have taught in them orthography, reading, writing, arithmetic, geography, English grammar, physiology, history of the United States, and good behavior, and such other branches of learning and other languages as the advancement of the pupils may require and the trustees from time to time direct. And whenever the parents or guardians of 25 or more children in attendance at any school of a township, town, or city shall so demand, it shall be the duty of the school trustee or trustees of said township, town, or city to procure efficient teachers and introduce the German language, as a branch of study, into such schools; and the tuition in said schools shall be without charge: *Provided*, Such demand is made before the teacher for said district is employed."

Upon the extent to which the course of study may be carried, James H. Smart, State superintendent (1880), said: "It is fair to assume that the trustees must provide suitable instruction for all the children who may have a right to attend school; that is, they must afford them such instruction as their attainments demand. If a child has mastered all the primary branches, and, being less than twenty-one years of age, still desires to attend school, the trustees must provide suitable instruction for him. It is not reasonable to expect him to spend further time on branches which he has mastered. The fact that the law permits children to attend school till they are twenty-one years of age is presumptive proof that the trustees may be required to furnish such instruction

as is suitable to their attainments till they reach that age. I think the argument here adduced equally applicable to trustees in cities as to those in townships, as the language of the statute applies to both alike."

Upon the power of the school authorities to arrange a course of study, the following official opinion was given in 1833: "The school law provides that instruction shall be imparted in certain studies, the German language under certain circumstances being included in the list. The time at which these studies shall be commenced, the order in which they shall be taken up, and the length of time devoted to each are matters which are left to the trustee or school board."

In accordance with the statutes and decisions cited the local school authorities throughout the State have prescribed courses of study which are essentially similar, while differing in details. The importance of uniformity in the high school grades, which are immediately introductory to the university, has led to an effort on the part of the State Teachers' Association to secure a uniform high school course. (See page 193.)

High school commissions.—The country schools, the high schools, and the State universities, which in many States form practically three distinct systems, are in Indiana happily united. The work of the country school or of corresponding departments of the city or town school prepares the pupil for admission to the high school. The latter, if it be a representative one, prepares its charge for admission to Indiana University, Purdue University, and the State Normal School.

In the term of Superintendent Milton B. Hopkins, in July, 1873, the following resolution was adopted by the board of trustees of the Indiana University:

"In order to bring the university into closer connection with the high schools of the State we recommend the following plan: A certificate from certain high schools (to be named hereafter by the State board of education) of a satisfactory examination sustained in the preparatory course, will entitle the bearer to admission to the freshman class."

At the meeting of the State board in the following August, a circular letter was addressed to the presidents of school boards and the superintendents of schools, with a view to determining how many and what high schools were qualified to perform the work of a preparatory department of the university. From that time, whenever a superintendent of schools has presented proof to the board that his course of study and the attainments of his teachers were sufficient to prepare pupils satisfactorily for the university, he has received a commission to certify graduates for admission to that institution. More recently a similar arrangement has been made by Purdue University and the State Normal School. The form of commission now in use is as follows:

STATE OF INDIANA.

HIGH SCHOOL COMMISSION.

This certifies that, Superintendent of the Graded Schools of the, is authorized by the State Board of Education to certify students of the High School Department of said schools for admission to the Indiana University, Purdue University, and the State Normal School, in accordance with the requirements of the said several institutions.

Department of
Public Instruction.

Indianapolis,, 18 . . .

For the State Board of Education.

. President.
. Secretary.

This plan has had an excellent influence upon the graded schools of the State, stimulating many cities and towns to extend their course of study. Commissions were granted during the years 1885-86 to the schools of 83 cities and towns.

A GRADED SCHOOL COURSE OF STUDY, AS EXEMPLIFIED IN INDIANAPOLIS.

First year.		Second year.	
First half, 1 B.	Second half, 1 A.	First half, 2 B.	Second half, 2 A.
READING: Word method. Chart primer. Blackboard.	READING: First Readers, parts I and II.	READING: Second Reader.	READING: Second Reader. Supplementary reading.
SPELLING: By sound. Letters learned.	SPELLING: Words of reading by letters.	SPELLING: Written from dictation.	SPELLING: Same as first half.
WRITING: Lines, curves, and combinations.	WRITING: Letters and combinations. Figures.	WRITING: No. 2, shorter course.	WRITING: No. 2, shorter course
NUMBER: Exercises with 1, 2, and 3.	ARITHMETIC: Addition and subtraction through 10.	ARITHMETIC: Review of first year. Grube's method; $\frac{1}{2}$ and $\frac{1}{3}$, add and subtract. Notation.	ARITHMETIC: Work of first half reviewed and continued.
GENERAL LESSONS: Songs, games, clay modelling, color and form.	GENERAL LESSONS: Plants, drawing, modelling, paper-cutting.	LANGUAGE: Sentences. Words. Verbs <i>have</i> and <i>be</i> . Conversations.	LANGUAGE: Work of first half reviewed and continued. Compositions.
MUSIC: Imitation exercises.	MUSIC: In book No. 1.	DRAWING: Compends. Nos. 1 and 2. Clay and paper work.	DRAWING: Book No. 1. Clay and paper work.
		MUSIC: In book No. 1.	MUSIC: In book No. 1.

HIGH SCHOOL GRADES.

Ninth year.		Tenth year.	
First half, 9 B.	Second half, 9 A.	First half, 10 B.	Second half, 10 A.
ENGLISH GRAMMAR.	ENGLISH GRAMMAR.	ENGLISH.	ENGLISH.
ALGEBRA.	ALGEBRA.	Plane geometry.	Arithmetic.
Physical geography.	Physics.	Physics.	Chemistry.
German, I.	German, I.	German, I.	German, I.
NOTES. 1. Pupils are graded by their English studies. 2. Three recitations are required of every pupil daily, unless excused. 3. Subjects in SMALL CAPITAL LETTERS are prescribed and must be taken in the order named. 4. Subjects in black type are prescribed and must be taken before graduation, but may give place to electives. 5. Subjects in <i>italics</i> may be taken as indicated. The subject is placed in the lowest grade in which it may be elected without special permission. Pupils of a higher grade may take any electives arranged for a lower grade. 6. There are two courses in German: I, extending through four years, and II, extending through three years.		German, II.	German, II.
		Commercial.	Commercial.
		Drawing.	Drawing.
		Latin.	Latin.
			Botany.
Eleventh year.		Twelfth year.	
First half, 11 B.	Second half, 11 A.	First half, 12 B.	Second half, 12 A.
ENGLISH: <i>General history.</i> <i>Chemistry.</i> <i>German, I.</i> <i>German, II.</i> <i>Political economy</i> and <i>Civil government.</i> <i>Latin (Cæsar).</i> <i>Botany.</i> <i>Physiology.</i> <i>Greek.</i> <i>French.</i> <i>Astronomy.</i> <i>Solid geometry.</i> <i>Zoology.</i> <i>Geology.</i>	ENGLISH: <i>General history.</i> <i>German, I.</i> <i>German, II.</i> <i>Latin (Cæsar).</i> <i>Trigonometry</i> and <i>Surveying.</i> <i>Greek.</i> <i>French.</i>	<i>English literature.</i> <i>German, I.</i> <i>German, II.</i> <i>Latin (Virgil).</i> <i>Greek (Anabasis).</i> <i>French.</i>	<i>English literature.</i> <i>College class.</i> <i>German, I.</i> <i>German, II.</i> <i>Latin (Virgil).</i> <i>Greek (Anabasis).</i> <i>French.</i>

PROPOSED UNIFORM COURSE OF STUDY FOR THE HIGH SCHOOLS OF THE STATE.

Reported December, 1885, by a Committee of the State Teachers' Association.

I. [9th year.]		II. [10th year.]	
First half.	Second half.	First half.	Second half.
Algebra.	Algebra.	Arithmetic.	Geometry.
Literary readings—two recitations a week. Grammar and thought analysis—three recitations a week.		American literature—two recitations a week. Composition and rhetoric—three recitations a week.	
Constitution.	Political economy.	Ancient history.	Mediæval and modern history.
Latin or German.	Latin or German.	Latin—Cæsar, or German.	Latin—Cæsar, or German.
III. [11th year.]		IV. [12th year.]	
First half.	Second half.	First half.	Second half.
Geometry.	Trigonometry and surveying.		
American literature—three recitations a week.	English literature—three recitations a week.	English literature and composition.	
Rhetoric—two recitations a week.	English history—two recitations a week.		
Physics.	Physics.	Mental science.	Moral science.
Latin—Virgil, or German.	Latin—Virgil, or German.	Chemistry, zoology.	Botany, physical geography.

NOTES.

1. Mathematics, 540 lessons—20 per cent. English, 648 lessons—24 per cent. History and philosophy, 432 lessons—16 per cent. Physical science, 540 lessons—20 per cent. Language, 540 lessons—20 per cent.

2. The course has been prepared with special reference to use in cities of ten thousand inhabitants and less, and with not more than three teachers in the high school.

3. The arrangement is such that pupils who wish to do so may enter the freshman year in our State colleges at close of the third year high school.

VIII.—HIGH SCHOOLS.

Township high schools necessary to a complete system.—Superintendent Jones, of Dakota: "In my last annual report I suggested that authority be delegated to each township in the Territory to establish a central high school, and that it be made a connecting link between the common schools and the universities. It would not be expected of each township that it establish and maintain such a school at once; but if the power is granted to them those having the necessary wealth may move in that direction immediately, while the weaker corporations should either wait till they acquire the ability or unite with one, two, or three others for the purpose. I am of the opinion that while the State undertakes to provide for the collegiate education of our children in addition to the common school course, there should be no break in the connection between them.

"No satisfactory reason can be urged for tolerating the 'missing link' which now exists, if there is a satisfactory reason that can be given for the establishment and maintenance by the State of the universities, which provide for the higher education. In fact the high school course is of far greater importance to the *people* than is the university course. At all events, the pupil is now barred from the university by a yawning chasm, which should be bridged over by the same system which bestows the common school education, when the structure will be complete. The pupil who begins with the first steps will climb the intellectual ladder round by round, till he reaches the climax; and the complete idea, the perfect system, the unity and grandeur of the structure will be the glory of the Commonwealth."

Influence of the high school.—Superintendent Morgan, of West Virginia: "As a part of the free schools the high school has become a factor of transcendent importance in the education of the people.

"Its influence is now specially marked in two directions. It is the crown and completion of the free school system, and by its close connection with the intermediate schools and the system of promotion therefrom it not only encourages but compels thorough work in them. The intermediate schools are in turn encouraged to thorough work by the prospect of advancement. In the second place, it affords the great body of the people the convenient means of academic training."

IX.—HYGIENE.

An improvement in heating and ventilation.—Superintendent Kennedy, of Wayne County, Pennsylvania: "The improvement made in heating and ventilating the graded school building at Honesdale deserves notice. The plans were made by William J. Baldwin, of the Sanitary Engineer, and are in successful operation. This system furnishes each of the 600 pupils 1,000 cubic feet of fresh, warm air per hour, and keeps the rooms at a proper temperature in the coldest weather. The air is introduced into the building through a cold air duct; from this extend smaller ducts, conveying the air to the heating-coils, of which there is one for each room. The air, when warmed, is passed by a separate duct into each room about 8 feet from the floor. Each room is provided with a foul-air duct (ventilating shaft), which starts from the floor and extends to the attic. Each ventilating shaft is provided with two registers—one near the floor, and the other near the ceiling—the first for ordinary ventilation, the last for ventilation in summer. Each ventilating shaft is provided with a radiator, to secure perfect draught. The foul-air ducts are collected in a chamber above, and from this a large duct passes through the roof, allowing the foul air to escape. The air is introduced into and taken from the rooms without perceptible currents, is pure, and maintained at a temperature of nearly 72 degrees."

Forcible removal of foul air necessary.—Superintendent Smith, of Syracuse, N. Y.: "We have not found the best results while depending on natural ventilation, and for this reason the power ventilation is contemplated in the High School at the beginning of next school year, by which the cold and foul air is to be withdrawn from the building by means of a fan acting on the principle of suction, and forcing the air through ventilating shafts into the open air in the roof. Drawing in the air in this manner from the rooms causes a partial vacuum, which is balanced by an equal amount of pure air, coming over steam-heated radiators in cold weather, or through the same apertures in warm weather without heat, making it possible to have nearly perfect ventilation at all seasons. This school was built with these shafts just as they will be when the apparatus is completed, depending upon the natural flow of foul air through these shafts; but during all the years the building has stood there has been at times no ventilation, and never such as should be had. The newer buildings are better than the old, but, as has been found in respect to the High School, we shall not realize such changes in the air as the best sanitary conditions require, till some mechanical appliance is made use of for driving out the contaminated and used-up school-room air."

Speaking of buildings without ventilating shafts, Superintendent Smith says: "Only the greatest care on the part of the teachers by opening windows or doors will protect pupils, as well as themselves, from the effects of overheated and bad air. This is not likely to be attended to as it should be on account of the many duties requiring teachers' attention and thought; and in many cases teachers are made conscious of the condition of the room by the complaints of pupils that they have headache, or by a feeling of exhaustion or prostration in themselves. The teacher at once opens into the outside air and exposes all in the room to such sudden change of temperature that there is even more danger than to have continued as they were. We hope for better things in the near future."

Ventilation of rural school-houses.—Dr. D. M. Currier, of New Hampshire, suggests a plan for the ventilation "of rural school-houses by constructing an incoming or cold-air duct under the timbers of the floor, reaching from outside and opening directly upwards under the stove, and furnished with a valve to regulate the flow. Completely surround the stove by a galvanized iron case. Ventilation could be provided by placing a register in the chimney near the floor. The chimney should be large, and the smoke-pipe should pass through it to the top, thus creating a powerful ventilating draught."

Headache in school children.—"Prof. N. J. Bystroff has examined 7,478 boys and girls in the St. Petersburg schools during the last five years, and found headache in 868, that is, 11.6 per cent. He states that the percentage of headache increases almost in a direct progression with the age of the children, as well as with the number of hours occupied by them for mental labor; thus, while headache occurred in only 5 per cent. of the children aged 8, it attacked from 28 to 40 per cent. of the pupils aged from 14 to 18. The author argues that an essential cause of obstinate headache in school children is the excessive mental strain enforced by the present educational programme, which leaves out of consideration the peculiarities of the child's nature and the elementary principles of scientific hygiene. The overstrain brings about an increased irritability of the brain and consecutive disturbances in the cerebral circulation. Professor Bystroff emphatically insists on the imperative necessity for permanently admitting medical men to conferences of school boards. Of palliative measures he mentions methodical gymnastics, mild aperients, in well-nourished children; steel in the

anæmic, bromides, inhalations of oxygen, and, in severe cases, a temporary discontinuance of all studies."—*British Medical Journal*, May 15, 1886.

A silent factor in education.—Superintendent Raab, of Illinois: "I take this opportunity of once more calling the attention of school directors, and school officers generally, to this silent factor in the education of our children: clean, healthful, pleasant school-houses and surroundings. Not only is the health of the pupils thereby preserved, but also the æsthetic and moral sense is aroused and cultivated."

X.—SCHOOL LIBRARIES.

The dime novel has disappeared.—Superintendent Howland, of Chicago, Ill.: "The value of a well-selected library, wisely used, in a school can hardly be estimated. In more than one of our schools dime novels, once so commonly found in the desks of the pupils, or between the leaves of their geographies, have disappeared, and the neighboring dealers no longer keep them in stock, as the demand has gone. Nor scarcely can there be a stronger safeguard against the many evil attractions of city life than this love—this habit of reading good books—a habit and a love which must begin even in the primary grades. This is the sparkling fount from which will flow the healthful current of virtue, intelligence, and good citizenship."

No better investment could be made.—Superintendent Hinsdale, of Cleveland, Ohio: "One of the most formidable obstacles to carrying out any large scheme of work, in language, composition, and history, is want of books. The books in private hands, both teachers' and pupils', and in the public library, are insufficient for the purpose. No better investment of an adequate amount of the public funds could be made than the purchase of a well-selected library of books, history, travel, etc., for every one of the large school buildings."

The most valuable part of the school.—Superintendent Kiehle, of Minnesota, in recommending State aid for the purchase of school libraries, says:

"At the age of 12 years every child ought to be a reader, and ought to begin to gather the harvest of knowledge found in good books. And especially is the life of the country well adapted to the improvement of this habit. The occupations of country life are quiet, and tend to thoughtfulness, and the lack of personal companionship and diverting amusements make the companionship of books the more enjoyable and profitable.

"I consider the well selected and carefully distributed library the most valuable part of the school. It is very possible that intelligence may prevail where there are many good books with but poor schools, but it is not to be expected that any school without the help of books will furnish society with intelligent and well informed men and women."

A most important factor.—Superintendent Lawhead, of Kansas: "From observation I am fully convinced that communities in which school district libraries are maintained are more intelligent, more progressive, and more law-abiding than communities that do not have such libraries. I believe them worthy the fostering care of the State as one of the important factors in the training of the young to become useful and intelligent citizens."

XI.—PUBLIC SCHOOLS.

THE FUNCTION OF THE PUBLIC SCHOOL.

[From the report of the Committee on Pedagogics of the National Council of Education.]

"Reasons for their existence.—The people in their corporate capacity have undertaken the establishment and maintenance of public schools for the following reasons:

"1. Private schools from their nature must be limited in number, while education should be universal.

"2. The education of the young is indispensable to the State, and cannot be left to the contingency of the pecuniary and social circumstances of the family. Education is a need of the poor as well as of the rich, and a need of the State should not be allowed to depend on charity.

"3. The matter and form of instruction imparted in the schools of a nation cannot be left to the contingency of private selection; they should be subservient to the objects of the State, and, therefore, influenced by the State. The State could not tolerate, for instance, that doctrines subversive of its institutions should be systematically inculcated in the minds of the young.

"While the State may favor private schools, it cannot look to them to meet the general want of education.

"4. Since the efficient government of the State requires the harmonious co-operation of the masses, it is a condition for the welfare of the State to provide schools in which the children of the people grow up together without class or sect distinction, so that a more homogeneous population may make the action of the Government harmonious and energetic.

"*The aim of the public school.*—The task of the public school is to co-operate with the family and the church, and to prepare for life in civil society. But the first two among these agencies are variable factors in the individual case, since family education may have neglected one child, and church education may be lacking in another. The scope of public school education is necessarily enlarged by this circumstance; it must not only complement, but supplement family and church education. The aim of public school training becomes thereby the development of relatively perfect manhood and womanhood.

"Since the power of the school is but a delegated one, and its prescribed function is instruction, the aim of public schools may be said to be the development of relatively perfect manhood and womanhood through instruction and through the guidance and discipline incidental thereto.

"*Classification of the public school.*—In so far as the public school has for its function to impart that education which is indispensable for the perpetuity of the body politic, it is the common school.

"The public school when organized as high school or college imparts education which, while not indispensable to each intelligent citizen, should, for the general good, be possessed by a considerable number of individuals. Such higher public education is designed to train that directive ability which is so important an element in the development of the material and intellectual resources of the State and in the administration and perfection of its laws.

"*The duty of the State.*—The State has the duty of maintaining common schools, because they are indispensable for its continued existence.

"*Function of the common school.*—The function of the common school is to develop more perfectly manhood and womanhood by educating children through instruction in that secular knowledge which in a civilized community is indispensable to the individual, and through the guidance and discipline incidental to such instruction.

"*The subjects of instruction in the common school.*—The subjects of instruction in the common school are, the acquisition of the means of civilized communication, language, reading, writing, arithmetic, which supplies the measure for the exchange of the common necessities of life and the more general economic values; a general knowledge of the country, its resources and position in the world, or popular geography; a knowledge of the institutions of the country, of their growth, and of the duties of citizenship.

"In addition to these studies which refer to the duties of citizenship more particularly, there are others which may be incorporated into the curriculum of the public school, since its aim is to train and develop manhood and womanhood and to supplement family and church instruction. The child should learn the laws of health, and have a general knowledge of the most common objects and laws of nature. Since he should be prepared for the duties of civil life, the local conditions of a system of schools may influence the course of study. Thus in cities or manufacturing centres more attention might be paid to drawing than in rural schools.

"Singing, originally introduced to aid church education, remains an object of instruction in most of the public schools, on account of the ennobling influence it has on the sentiments and the will, and on account of the assistance which it gives in the management of the school-room.

"The common school should also attend to physical training. 1. By observing proper hygienic conditions. 2. By gymnastic exercises.

"Instruction is a means to an end. The aim is the development of manhood and womanhood in accordance with the genius of national institutions. Instruction is imparted because it educates.

"Instruction educates because it gives exercise and thereby training to the faculties. The circle of subjects should, therefore, be sufficiently wide and various to appeal to the faculties in general.

"Instruction educates by widening the views of life and supplementing the experience of the child, thus extending the circle of his interests. Through the deeper insight into the relations of life he must learn to act on principle and intelligently.

"The moral training of the public school is, in a general way, to place the pupil in a position similar to those in which he finds himself in life; to accustom him to live with his equals, to make him reflect on his actions, to lead him to act according to fixed principles, intelligently.

"To state the moral influences of the public school more in detail: The moral agencies incidental to instruction are guidance and discipline. There is, in the first place, guidance in the moral school-room habits of silence, self-control, concentration of effort, of punctuality and regularity, of industry. There is also the preparation for civil life, which the child receives by being thrown into the society of his equals, by which he learns to respect their rights and to maintain his own; the habitual submission to law and authority; experience of the evil consequences of wrong-doing; reverence for authority; reflection on moral rules and action controlled by moral intelligence as opposed to impulse."

How far the State should go in educating a child.—Superintendent Baker, of Texas: "I believe that in this day the character of its public schools will determine how far a State has advanced in civilization. An intense desire for the ultimate success of the public schools of Texas makes me bold to call attention to a much mooted and very important subject. It has not yet been carefully considered by any Legislature so far as I know, but there is no reason for longer delay. The object of providing free tuition for the child is to fit him for intelligent citizenship; to enable him to participate in the privileges of a citizen and discharge the duties incumbent upon him as a member of society. It is rather a duty the Government owes to itself than to the child. This, added to the fact that without free schools a great number of the people would be reared in ignorance of the privileges and duties of citizenship, I conceive to be the only argument in support of a free school system. Just how far the State should go in thus preparing a child is a question of much moment. Shall the line be drawn at what is commonly termed secondary education, or shall the high school, having in its curriculum the higher mathematics, the sciences, and Latin and Greek, be supported? Is the high school necessary to mould the character of citizenship mentioned? I believe not. A thorough knowledge of orthography, penmanship, reading, English grammar, geography, arithmetic, and English composition I believe amply sufficient for the purpose indicated. A knowledge of the branches taught in the high school may better prepare one for advanced thought and exalted position, but they are not necessary to the performance of the simple duties appertaining to the citizen. If what is termed the higher education is bestowed at the public expense, the poor as well as the rich are taxed to bestow it. The children of these poor seldom go through the high school, no matter if the tuition is free, because when ready for the branches taught in it they have arrived at the age of breadwinners and must work. Those who attend the high school are as a rule (and there are few exceptions to the rule) the sons and daughters of people who are so fortunate as to be able to educate their children at private schools. The high school, therefore, is in fact a school only for the fortunate few, while the many are taxed for its support. Drawing, as it does, largely from the school fund, its teachers being paid higher salaries than other teachers, the terms of the primary and intermediate schools are shortened and the State is debarred from the privilege of increasing the scholastic age. They thus keep out of the schools children under 8 and over 16 years whose education the State has made itself responsible for, and cause the Government to fail to comply with the constitutional provision declaring that a term of six months shall be maintained. These are potent reasons against the maintenance of high schools, but they are not more potent than the simple one first stated: 'The State does not owe the child the character of education they bestow.'

The settled policy of the whole country.—Superintendent Buchanan, of Virginia: "Education at public expense has become the settled policy of the whole country. Hence a system of public free schools is to be found in every State and Territory of the Union. In support of these systems the annual expenditures now reach \$110,000,000. This vast sum is meant to be an investment in enlightened and virtuous citizenship, upon which depends the safety of society, State and nation. Virginia is endeavoring to furnish her proper share of this investment."

A better sentiment in favor of public education required.—Superintendent Finger, of North Carolina: "Education at the expense of the State is a part of modern civilization. It can not be successfully resisted. Especially is this so in a republican form of government, such as that of the United States. If there is any one thing that stands out prominently in the history of the country, it is the stress that has all the time been laid upon the importance of education for the people.

"The constitution of North Carolina says: 'The people have a right to the privilege of education, and it is the duty of the State to guard and maintain that right.' This doctrine is fundamental and right, and therefore it must have recognition.

"There are now and always have been persons, in our State and in all the States, who say that it is wrong to tax one man to educate another man's children, forgetful of this fundamental right; forgetful of the fact that the safety of life and property and the welfare of the State depend upon the virtue and intelligence of the people. Such persons

try to make it appear that the public schools produce crime, because in some communities where they have flourished crime has not decreased, or perhaps has increased. They are not mindful of the fact that, if in such communities crime has increased, as shown by the number of arrests, there has also been a large increase of criminal statutes which may account for them. Courses of conduct are now often criminal under statute laws which were not criminal before their enactment. They are not mindful of the fact that any increase of crime might be accounted for by a number of causes consequent upon the ever changing conditions of the population of such communities.

"The facts are that if there is real increase of crime in such communities, which is to be doubted, figures to the contrary notwithstanding, it occurs *in spite of all* remedial agencies and not because of any one of them. It may be true, and doubtless is, that the public schools have not done as much as they might have done, but this is no reason for wholesale condemnation. It is rather a reason why all good people should lend their active influence to make them come up to the full measure of usefulness.

"If those who complain of poor results would actively join the public school workers and help to manage the schools, better results would everywhere be attained. The public schools are here to stay, and they will gradually be improved—so improved as more and more to command the respect and patronage of our people. It is the part of wisdom for all good people to recognize these things as facts, and take an active interest in making the schools better. Let us have a *better sentiment in favor of public education*, to the end that the money we do pay may have the best possible application and results.

"It is a common complaint that the public school terms are so short that they do not do much good. Of course all the friends of public education very much regret that we can not have longer terms; but how easy it would be for almost any neighborhood in the State to supplement the public funds by *private subscriptions* and have longer terms. Many districts are now doing this, and more will do it as sentiment in favor of educating the people improves. Legislation that tends to improve the teachers and lengthen the sessions will help to create favorable sentiment."

What shall be taught in the public schools?—Superintendent Draper, of New York State: "What shall be taught in the schools is a question of no small importance, and it is a difficult one to answer. The law leaves it to each locality to settle for itself. The tendency of the times, particularly in the larger places, is to undertake too much. It ought to be remembered that it does not devolve upon the public schools to put into a child's head all that he will ever be expected to know. It is useless to tax the memory with multitudinous pieces of mere information, no matter how worthy of note such information may be. Of course some facts must be remembered, but the remembering of too many mere facts is now being insisted upon. It is better to create a desire for knowledge, and supply the implements with which to gain it. When searched out through effort, it will be retained without difficulty. The fact is, that the manner in which the school education is started, is of more consequence than the manner in which it is finished out. The people are not generally unwilling that the State should foster and support advanced education, but they will insist that it shall not be done at the expense of elementary work, well knowing that it is of far greater importance that the masses be thoroughly grounded in fundamentals than that the few shall be elaborately topped out and polished off. If school work is not well commenced, it never will be well finished.

"More than 90 per cent. of all the children who ever come into the public schools never get beyond the study of the elementary branches, and there is a wide-spread feeling that the schools do not accomplish the results for this great mass of pupils which they ought to produce. A wide-spread feeling usually rests upon some foundation. It seems to me that a State which is spending \$15,000,000 a year for general education, can well afford to enter upon a full inquiry which will determine whether the mass of children in this country of a given age can read and write and spell and figure as well as the mass of children of the same age in the monarchical governments of Europe, and if not, why not? My reading and observation, confessedly not large, raise grave doubts upon this question. A republican state can not afford to have any doubts about such a question as this.

"There has been much discussion during the year relative to the introduction of manual training as a regular branch of public school work, and several cities, notably New York and Albany, have undertaken a thorough trial of the experiment. It is much to be hoped that it may prove a wise undertaking. There will hardly be two opinions as to the advantages of industrial training, but it must be demonstrated, upon actual trial, that it can be made a part of our common school work with advantage to pupils, without detracting from the old-fashioned and essential work, to which reference has just been made, before it should be generally taken in hand by the school authorities. The experiments which have been entered upon will be watched with much interest. The

test will be a severe one, but it must be met successfully, by a trial in good faith, before the already over-full courses of study in the schools should everywhere be opened to admit what is commonly called industrial training.

"There is a common misapprehension in this connection. Manual training need not be confined to carpentry work with boys, or making aprons or dresses with girls. Free-hand or industrial drawing may train the hand and the eye more effectually than handling a saw or a needle. It is easily taught, it is inexpensive, and it is practicable. It is the best possible preparation for further manual work. Every school in the State may undertake this without difficulty, and with good promise of excellent results, and then safely wait for the verdict of those who are further experimenting upon the subject.

"The schools must not only educate the mind but the heart as well. Schools are maintained for the purpose of turning out good citizens. Character is forming while the intellectuality is being educated, and the influence of the schools should be exercised to form and shape it rightly. We have had much discussion in this country in reference to the reading of the Bible and the observance of religious exercises in the schools, and it has been determined that these must be omitted because of the likelihood of their being used for the propagation of sectarianism. But this must not be deemed to prevent all moral training in the public schools. On the contrary, there should be a strong moral influence exerted at all times, in every school-room, which will go continually to the sound training and preparation of boys and girls for the social duties and obligations of life and for the responsibilities of citizenship in a republic where the 'will of the people is the law of the land.'

"There is, unfortunately, but little done to stimulate patriotism among children in the public schools, or outside of them. A generation ago it was common to use the masterpieces of our national oratory for the purposes of recitation and declamation in the schools, and the resultant influences were of no small consequence in arousing and cultivating patriotic ardor in the rising generation. Then every child was required to take part in these exercises. But even this is no longer common. The modern fashion is to take pupils who give promise of special success as orators and readers and train them elaborately for show upon public occasions. The older custom might be revived with profit. The setting apart of an occasional hour for exercises which would lead children to revere and love their country, and the requiring of every child to take part in such exercises, is a thing which may properly and profitably be done in every public school.

"The mission of the public schools is to best prepare the greatest possible number of children for the activities of life, for social and industrial relations, and for the responsibilities of citizenship under such a Government as ours. The few must not be favored at the expense of the many. The beginners must have the most care and the best work. What is done must be practical. A philosophy is of small use unless it materializes. Children must be evenly educated in all directions. Just what shall be taught, in detail, must depend upon what, in a practical way, promotes the end for which the schools are maintained at public and general expense."

Necessity of public schools.—Hon. John W. Dickinson, secretary of Massachusetts board of education: "The ends to be accomplished by a free state are the development of the people and protection in the enjoyment of their natural rights. The effectual means to be employed for the accomplishment of these ends are public educational institutions and a popular government, neither of which can exist without the other. For the existence of a free state a common education of the people is necessary, that they may be trained to think alike and to exercise that common sympathy through which alone it is possible for human individuals to become a people. Burke says that 'in a state of rude nature there is no such thing as a people. A number of men in themselves have no collective capacity. The idea of a people is the idea of a corporation. It is wholly artificial, and made, like other legal fictions, by common agreement.' A common agreement is the result of common thinking and common sympathy. The conditions of unity in thinking and feeling are public educational institutions where the young may be trained by common courses of study pursued in accordance with a common method.

"Public schools, therefore, are necessary to the existence of a people in the true sense of that term, and especially to the existence of a free people who must labor together for common ends. But the existence of these institutions is impossible unless they are organized, controlled, and supported by the state. For in no other way can a plan of instruction be made common and in harmony with the constitution of the state, nor universal and regular study be compelled, nor constant and ample means of support be provided.

"The right, duty, and necessity of establishing public schools, and making the use of them universal and compulsory under the direction of the state, become evident by the same mode of reasoning as would be employed to prove the right, duty, and necessity of establishing the state itself.

"The dissolution of a State has begun when any considerable portion of its citizens refuses to be educated into the spirit of its constitution and into sympathy with its important provisions. Loyalty to the State is shown in fidelity to those institutions which are adapted to make intelligent, loyal, and virtuous citizens."

XII.—RELIGIOUS AND MORAL TRAINING.

The teacher who neglects it a signal failure.—Superintendent Finger, of North Carolina: "Besides practical intellectual training, we insist upon moral and religious development. Of course we cannot give religious instruction except in a general way, all denominational or sectarian teaching being excluded. But there is common and undisputed ground for all to stand upon. No person rises to the full stature of manhood until he chooses to model his life according to the eternal principles of right, and this is only tantamount to saying, until he chooses to please God. *Love and fear* of Him must be made to result in reverence for Him and in obedience to His will.

"In proper training at home, the child is brought to love and, in a sense, to fear its parents, the two principles of action working together to produce reverence and obedience. So, too, when at school the pupil has proper treatment, he will love and fear his teacher and will choose, habitually, to obey him.

"But all obedience in the family, the school, or the state should be insisted upon, because such obedience is in accordance with the fundamental principles of *right*. I do not mean to discuss the foundation of obligation—whether a given course of conduct is right because it results in good, or whether it is right because commanded by the great Creator of all things. The ten commandments embody great principles, obedience to which results in good to those who obey and to all men, and at the same time they have the divine approval.

"If it be said that these principles were *eternal* truth, binding upon men before they were commanded by God from Mount Sinai, yet He did sanction them because, as the Creator of all things, He did so constitute the relations between all men and their fellows and between all men and Himself, that these principles always result in good. And so we come back to the will of God as the foundation of all obligation and of obedience to all proper authority.

"It is therefore the divine will that all teachers should strive to know and make the foundation of all moral teaching. A child may, at home and at school, be compelled by fear to keep himself within certain rules of action, but this course will afford him but a poor preparation for the duties of life as a citizen. If he is not taught continually to choose his lines of conduct in accordance with what is right—right in this highest sense—so that he may grow up into the *habit of choosing* to do right, he will most probably be unfit to meet the duties and temptations of active life when they confront him.

"It is the *will* that determines what any intellectual being shall do and what he shall not do, and hence the *will* must be so trained that what is right shall be habitually followed. The teacher who neglects to emphasize moral and religious training to this extent makes a signal failure.

"If it be said that this requirement excludes from the school-room the atheist and all whose lives are not directed in the love and fear of God, the ready reply is, for the children's sakes so let it be; for the country's sake so let it be.

"If it be said that we cannot apply religious tests, the ready reply is that the employment of teachers is a matter of contract, and no committee is compelled to employ any particular person, no matter what his intellectual qualifications may be, if not satisfied with his character in this highest sense.

"If it be said that this line of training involves the use of the Bible, the ready reply is that scarcely any one will be found to object to its use in the schools if used without sectarian teaching; and no one will object to the teaching of the grand and eternal principles of truth which it contains, that all religious people in this country hold in common."

Should never be omitted nor postponed.—Superintendent Welcker, of California: "The one great want in the public schools is a greater attention on the part of teachers and other authorities to moral instruction—to *character building*. To turn out good, honest, clean-living men and women, is that which should be, not merely acknowledged, but *felt* to be the principal end and aim of the public schools; that nothing should come before or be allowed to interfere with this good design; that intellectual education should be subordinated to it, and that this instruction should be not merely incidental, coming to the front on all suitable occasions, but that it should have its regular and frequent place on the programme of exercises. It should never be omitted or postponed in favor of anything else."

The highest end of education.—The following resolution, among others, was adopted at a State convention of the county superintendents of Colorado:

"*Resolved*, That we consider the development of character as the highest end of education and the only safe basis of American citizenship, and we urge upon superintendents the duty of doing all in their power to purify the moral atmosphere of the schools and all their surroundings."

XIII.—REVENUE.

Remedy for inequality of school term.—Superintendent Finger, of North Carolina, also calls the attention of the General Assembly to the need of a State tax for the purpose of equalizing the school term throughout the State: "While an increase of the rate in the school law could be made to provide an average of four months in the State, that would not afford all the counties that length of term. Some would have more and some less than four months, according to their respective valuation of property and density of population. There is no way to remedy this inequality other than to have legislation that would distribute all or a part of the school money direct from the State treasury to the counties on a per capita basis. Our system as it now stands contemplates that each county shall furnish its own school funds. The State board of education has essentially no funds to distribute to the counties other than such as may be derived from the entry of public lands and from the sale of swamp lands, from which the receipts are very small. Under our statutes, our system is a county system."

The State should provide facilities.—Superintendent Young, of Nevada: "I would renew my recommendation of two years ago that the rate of State school tax be increased. Experience demonstrates that it is not satisfactory to leave this question of education so largely to the counties. The State should provide adequate school facilities for all of its children. Under the existing laws some counties have an average school year of ten months, while other counties have an average of less than five months. By increasing the State tax the terms of school might be made more uniform and the schools be made more efficient."

Object of State appropriation.—Superintendent Higbee, of Pennsylvania: "The purpose of all State appropriation to the schools is to help the children of the Commonwealth, that they all may have every opportunity of securing that culture without which the possibilities of their personal being can not be realized. Any movement, therefore, upon the part of directors to weaken the autonomy of their districts by making them dependent upon the State appropriation, or to lessen, in any way, their sense of the necessity of vigorous self-supporting work, violates the very spirit and intent of the act of appropriation. Let the increased fund be used in granting better salaries to teachers now underpaid, in securing better teachers by a general advance of salaries, in lengthening the school term, and in increasing apparatus and libraries."

A State tax recommended for Minnesota.—Superintendent Kiehle, after showing how much shorter school terms some districts have than others, notwithstanding they tax themselves at a heavier rate and expend more per pupil, recommends a State tax, to be uniformly distributed. He says: "We have no State tax for the aid of common schools. The one mill tax is only a compulsory local tax, and what is called the State appropriation is only a distribution by the State of a government fund, just as the university receives aid from the university and agricultural college land grants. The State is aiding by direct tax all departments of education,—university, normal schools, high schools, reform school, institutions for deaf, blind, and imbeciles,—all, except the common schools, the schools of the people. Still more, these districts are not allowed even the full local tax for the support of their schools. The railroads pay an income tax to the State, and are therefore exempt from all local taxation. This tax, which amounts to over \$600,000 annually, is used for the support of every department of government, and is distributed to every educational institution except the common schools. The necessities of the situation compel me to urge upon the attention of the Legislature the important interests of these schools, which care for nine-tenths of the children of the State."

A uniform State and county tax needed.—Superintendent Pearsall, of Cameron County, Pa.: "Many of our districts are paying a high rate of school tax, yet are unable to provide first-class school-houses, furniture or apparatus and keep the schools in session over six months.

"I do not know as this can be remedied. But if the common schools were founded on the benevolent plan—that the taxes of the rich might aid in educating the poor—why not extend the plan and let the taxes of the rich districts aid the poor districts. In other words make the school-tax uniform through the county or State.

"Again, we deem the present plan of distributing the State appropriation as clearly favoring the thickly-settled portions of the Commonwealth; were the distribution rated upon the number of schools, or the number of pupils, instead of the number of tax-

ables, it would direct the appropriation where most needed—that is, to the poor and thinly-settled districts.”

The strong should help the weak.—Superintendent Buchanan, of Virginia: “They do in the matter of school funds. Upwards of \$300,000 of State funds were apportioned during the present year. The school population is the basis of apportionment. To the poor child, therefore, is allotted the same amount as to the rich. Some counties, and the cities as well, pay into the public treasury more State school money than is returned to them by apportionment. The excess goes to the weaker counties. For illustration, county A pays \$8,000 State school tax, county B only \$4,000. But suppose the school population of the two counties to be the same. Then each is entitled to the same apportionment, say, \$6,000. Therefore A helps B to the extent of \$2,000. Furthermore, the State fund, when apportioned to the counties, is distributed just as is the county school money among the magisterial districts on the basis of the school population. So the stronger magisterial districts help the weaker in the matter of county school funds.”

Apportionment should be based on attendance.—Superintendent Holcombe, of Indiana: “The State’s school revenues are apportioned among the several counties and the several school corporations in each county, on the basis of the entire number of persons of school age residing within the counties and corporations, respectively, without considering how many of these actually attend the schools. The variation in the attendance upon the public schools in different counties is very great. In a number of towns and cities, and in the rural districts of several counties, there are many private schools which receive a liberal patronage. Yet all the resident children attending these are enumerated, public revenue is apportioned for them and drawn by the corporations in which they live. Such a corporation, it is evident, maintains schools for only a part of its children; yet it receives revenue for the tuition of all. In other counties the people depend entirely upon the public schools, and must, therefore, provide accommodations for all the children who desire to attend. Thus the communities that have to educate only a part of their children are placed at an unfair advantage compared with those that must provide for all. The former receive from the State enough money to maintain their schools for as long a term as is desired, and sometimes even to accumulate a surplus from year to year; the latter can not keep their schools open a reasonable length of time without heavy local taxation. This establishes a kind of premium upon a small attendance in the public schools.”

“I think, therefore, that the revenues ought to be apportioned upon the actual attendance of children in the schools, as nearly as it can be ascertained. Such is the practice in several States. This attendance could be reported by the teachers directly to the county superintendent, and by the county superintendent to the State superintendent.”

“The enumeration is now taken every year. It is the work of not less than one man, for several days, in each of fifteen hundred or more corporations. The expense of this work is considerable. I think \$15,000 a year a low estimate. This expense would be saved by the plan I have suggested. But as that plan involves a radical change in the system of apportioning our revenues, it may not commend itself to the approval of the Assembly. Should such be the case, I suggest that a biennial enumeration of the school children would be sufficient to secure a proper apportionment of revenue on the present basis.”

Apportionment of township school revenue; where compulsory charity should stop.—Superintendent Jones, of Dakota: “The tuition fund of the township should be apportioned by the board in equal amounts to the various subdistricts, whenever the amounts to be apportioned do not exceed the sum of \$180 per annum to each subdistrict. This admits of hiring a teacher for six months each year for each school in the township at the rate of \$30 per month. If there is a balance in the tuition fund of the township after the above division is made, such balance should be apportioned to the several subdistricts in proportion to their assessed valuation. If any subdistrict fails to use its share of the funds for any year, the amount should be withdrawn from such subdistrict and divided among those subdistricts in which the fund has been used and six months’ school taught, as provided for in the apportionment. This provision would assist the weaker settlements in maintaining a reasonably fair school for a reasonable time each year and admit of hiring, at least, an average teacher. Further than this compulsory charity should not be required to extend, even from an educational standpoint. After this generous provision is made the remainder of the public funds should be divided according to the assessed valuation. This will admit of the maintenance of a better school for a longer time in the stronger subdistricts, and in many cases it will admit of the support of graded schools in small towns and villages where they are as much needed as are the primaries in the rural settlements. Another benefit to be derived from such provision is the compulsory payment of fair wages to teachers, thereby inducing qualified teachers to seek and remain in the profession. Let it once be understood that

the minimum of wages paid in Dakota is \$30 per month and we shall soon have a corps of teachers who will work miracles, almost, in our educational advancement. One very excellent teacher writes me as follows: 'I find many teachers of our county wide awake and interested in their work, but the majority are so poorly paid that they can not afford to buy books, travel to institutes, and otherwise improve themselves. I know of one who is getting \$25 per month and pays \$14 per month—or \$3.50 per week—for board.' Some good teachers are compelled to teach at such wages because they are forced into competition with non-professional and unqualified teachers. Thus, the professional teacher is forced into competition with farm hands who would otherwise be idle during the winter months, and who possess, as a rule, very few of the qualifications that go to make up the real teacher. It is here that we find an illustration of the most marked difference between *teaching* and *keeping school*."

XIV.—SCHOOL-HOUSES.

COUNTRY SCHOOLS.

[From the *School Laws of Oregon*, 1887, pp. 135-8.]

Location.

1. It is assumed that the school district has been accurately surveyed and the metes and bounds recorded. Without this the choice must be to some extent guess work. The location should be as near as may be convenient to the geographical centre of the district; but reference must be had to the roads by which it can be reached and the impediments that may lie in the way. In rural districts the geographical centre when access is easy should be preferred to the centre of population, because the latter is liable to change.

Site.

2. Hollows and the edges of swamps should be avoided. Hill-tops are also objectionable. A moderate elevation from which the ground slopes in all directions is to be preferred. A piece of woods which would shelter the house from the prevalent winds of winter is a great protection; but no trees should be allowed to stand within 50 feet of the building.

Orientation.

3. This question has not yet been settled by theorists. So much depends on the location and the site and the kind of building that is erected that no general rule can be given. Considering that the country school-house is usually closed for about four months in summer, it will generally be most convenient to have the house built so that the pupils may sit facing the north; the windows should then be on the east and west sides.

Plan and size.

4. Let us for the sake of simplicity confine our attention to the country school-house with one teacher and an attendance of from 20 to 50 pupils. In such school-houses more than two-thirds of the people of the United States have received and will receive their elementary education. A square house is objectionable. The length should be about one-third greater than the width. This gives room for the teacher's platform and for a recitation bench, and places the desks in a square block in front of the teacher. There should be at least 12 square feet of floor space for each pupil. The ceiling should be $12\frac{1}{2}$ feet in average height; this will allow each pupil 150 cubic feet of air space, and under no circumstances should there be less than this amount. A house 24 x 18, inside measurement, will accommodate twenty-two pupils; a house 28 x 21 will accommodate forty pupils, 24 x 32, fifty pupils. It is advisable to build a house large enough for an attendance one-fourth larger than the number usually going to school in the district. The new house attracts better teachers and the double attraction secures more pupils.

Light, heat, and ventilation.

5. If the teacher's platform is on the north side of the house and the pupils' entrance on the south side, the windows should be on the east and west, none on the other sides. The eastern windows should be grouped towards the north and the western windows should be grouped towards the south. If the windows are equally distributed over the walls, the lighting is bad for some purposes, and there is no good place for black-boards. If two-fifths of the length of each of the two walls (the eastern and western) is assigned to a group of windows, the remaining wall-space is ample for black-board surface, and

each black-board is exactly opposite to a window. The placing of black-boards on the piers between the windows is very objectionable. Whether the black-board surface is wood, or slate, or plaster, it should be a permanent part of the wall itself. Slate is in the long run the *cheapest*, as it is also the best material. Movable black-boards in small houses are troublesome.

A ventilating stove is the best available source of heat. It costs but little more than an ordinary stove. Almost any stove can be converted into a "ventilator" by surrounding it with a sheet-iron jacket, and bringing a tube from the exterior air to the space between the stove and the outer casing. The chimney flue should be divided longitudinally into two parts, one for the escape of smoke and the other for the escape of vitiated air. The opening for the latter purpose should be at or very near the floor. The best place for the stove is usually the northwest corner of the house. Two moderate sized stoves placed in different corners are better than one large one. Only one of them is needed in moderate weather and two will make the room comfortable in the coldest part of winter. A large stove in the middle of a school-room is an unsightly obstruction and tends to produce disorder. A ventilating stove placed in the northwest corner, with a stove-pipe extending almost to the ceiling and by a horizontal branch entering a flue in the southwest corner will give an almost equable temperature in all parts of the room. The opening into such a smoke flue near the floor will be a very efficient aid to ventilation, but the opening should be protected by a register which can be closed at pleasure.

It frequently happens that such aids to ventilation as have been described are not sufficient. Our reliance must then be placed on the doors and windows. The windows should be within 12 inches of the ceiling and should come down to the level of the desks. They should be in two sashes, with cords and pulleys to move up and down. It is quite a common practice to lower the top sashes a few inches and keep them in this position while the school is in session. This is a double error, it lets out the pure, warm air which we wish to retain, and lets in a stream of cold air directly on the heads of the pupils. If the ventilating flue with an opening at the floor, is not sufficient to carry off the impure air, the best plan is to open every door and window in the building for one or two minutes, not more than three minutes, and when the room has been thoroughly flushed with fresh air close all the openings. If necessary, the operation may be repeated at the end of every hour.

Wardrobes or cloak rooms.

6. A place for depositing the outer garments in safety and in an orderly manner is a necessity in even the cheapest and smallest school-house. Such a place is often obtained by building a vestibule in front of the house. This arrangement improves the external appearance of the house, but it is comparatively costly and not free from other objections. The cheapest and best plan in a house of only one room is to cut off from the south side of the room two small cloak rooms, one for the boys and one for the girls. The pupils' entrance is by a door leading into the small passage between these two closets. There is no door to the closets; an arched doorway always open exposes the interior of the closets at all times to the eye of the teacher whose desk is in the north side of the house. These closets should be furnished with suitable clothes pins and with shelves to hold lunch baskets.

Larger houses.

7. If two rooms are needed they should be on the same floor and separated by a glass partition with movable sashes. A front room 24 by 32 and a back room 24 by 30 will accommodate about one hundred pupils. The flues should be in the walls adjoining the partition. For three rooms the building should be of a T shape, the perpendicular line representing a room 24 by 32, and the horizontal line two rooms, each 23 by 21. The flues may be conveniently placed in the angles where the front building adjoins the rear building. For four rooms place a corridor 6 feet wide between two sets of rooms, such as are described in the beginning of this paragraph. It is only when more than four rooms are needed, or where the ground is unusually expensive, that a two-story house should be built.

Plastering.

8. As most of country school-houses are closed during nearly half the year, the plastering is apt to be affected by the damp. The walls should be wainscoted to the height of 4 feet from the floor. If the rest of the wall were sheathed with wood of a lighter color than the wainscoting and the ceiling covered with the same material, it would be found much better than plaster, more ornamental, more durable, and not so much more expensive.

Outbuildings.

9. The health and comfort of teacher demand:

First. That a substantial woodshed be built, and a sufficient supply of good fuel be placed therein at the beginning of each term.

Second. Common decency always demands that water-closets be provided and placed in the opposite rear angles of the school-yard, or in some other convenient situation. Gravel, plank, or brick should be laid from the school-house to these buildings. The advantages of placing these closets in easy and convenient communication with the school-room are numerous. The fierce winds of winter, the wet and soft grounds in fall and spring are dangerous exposures to delicate children in leaving a hot room and who are compelled to traverse the length of the playground through mud and water to a mean and miserable shed, through which the wind constantly and freely blows. These water-closets should be simple and substantial in construction and not too large. Two feet and a half room is ample for each child, and never under any circumstances should there be two seats in the same inclosure. Each seat should be in an inclosure by itself, and the screens between each one should be 6 feet in height or more. In very many delicate and nervous children nature refuses to perform its usual functions, however great the necessity, in the presence of others or under unaccustomed circumstances, and a decent privacy in the school conveniences is necessary to save such from daily pain and more often serious consequences.

The promiscuous arrangement and condition of the ordinary school privileges urgently demand that these necessary appliances should receive at least as much care as the other circumstances of school life.

Apparatus.

10. Globes, charts, numeral frames, outline wall maps, ink, paper, text-books, cube and square root blocks are necessary appliances for the efficient management of every school.

Furniture.

11. Among the indispensable articles of furniture are a few chairs, a teacher's table, black-board and crayons, a clock, a dictionary, a water pail and cups, pointers, erasers, brooms, and brushes. Each school should be furnished with a closet, in which the movable property may be secured.

Improvements in school-houses.—Superintendent Williams, of York County, Pa.: "Directors should exercise more care in the location of school buildings. A house should never be built on low, swampy ground, on the top of the highest hill in the district, or on a stony piece of ground that is of no value for any other purpose, nor on the rear of the lot, compelling children to wade to it through mud over shoe-tops. Houses should be built on dry ground, sheltered from the cold blasts of wind, and the entrance should always be away from the sunny side. Houses are often built too small. A house should be long enough to afford ample room for seating, recitation, and black-board exercises. The space between the last seat and the black-board is nearly always too small for convenience and satisfactory recitation work. The width of the room is very often insufficient, causing narrow aisles, and great inconvenience in passing to and from recitation. The centre aisle is often not more than four feet wide, making it inconvenient and unsatisfactory. Ceilings are generally too low. A house should be long enough, wide enough, and high enough to afford ample room and capacity for good ventilation. School grounds are nearly always insufficient. No less than half an acre should be given to every house. A few dollars invested for this purpose might save many dollars, broken limbs, and many other serious injuries. A few porches should be removed and built larger, more substantial, and closed at the ends. Several pupils have been severely injured, and, in one case, a pupil lost his life by neglecting so small a matter as closing the sides of a porch."

The grounds should be fenced.—Superintendent McNeal, of Dauphin County, Pa.: "Arbor Day has done much for the improvement of our school grounds. In many of the yards shade trees have been planted and are growing nicely, and in a few years will present the appearance of beautiful parks. Much more would have been done in this direction if the yards were all fenced. Let directors fence the grounds so that the trees and shrubbery will be protected, and the teachers and pupils can be relied upon to do the rest in the way of beautifying them."

A factor of more than ordinary importance.—Superintendent Hamilton, of Allegheny County, Pa.: "The school-room environment of the pupil is a factor in his educational development of more than ordinary importance. Nothing, perhaps, if we except good teachers, contributes more to the success of school work than well-planned and suitably-

furnished school buildings. The proper heating, lighting, and ventilating of these buildings, as well as the suitable fencing, grading, and beautifying of the grounds attached thereto, must each have its requisite attention before the highest results can be expected."

Provide home-like attractions and conveniences.—Superintendent Strayer, of Cambria County, Pa.: "There is not, however, the interest taken in the improvement of school grounds and houses that there should be. Grounds should be inclosed with a neat, substantial fence and shade trees planted. It is an absolute waste of time and money to plant trees according to the instructions of the Governor and State Superintendent, unless grounds are freed from rubbish and placed in proper condition. Arbor Day exercises will never be generally observed until a radical change is made, and school officers, teachers, and patrons plainly see that houses and grounds should receive the same attention that is bestowed on other educational agencies. Is it not the duty of all concerned to provide home-like attractions and conveniences for our boys and girls if we would wisely expend the money given to the support of the common schools?"

XV.—SCHOOL SYSTEMS.

The Minnesota system of education.—Superintendent Kiehle: "Our system of education may be considered complete when a good common school, well equipped, and well taught for at least eight months of the year, is located within the reach of every family, and from which every boy and girl of promise and ambition may reach the high school. From the high school the way should be plain and practicable to any of the departments of the university. In brief, every child of the State should have the opportunity and encouragement to make the most of himself, to attain the highest degree of skill, intellectual and mechanical, of which he is capable, and therefore his highest usefulness.

"Moreover, a system of education does not consist in the aggregate of all parts, as when the elementary, the academic, and the collegiate are all formed within the State without organic relations.

"I believe that Minnesota may claim justly, and with some pride, not only that she has schools of all grades, but that they are so related that each department, grade, or class is adapted to and contributes directly to the efficiency of the others. The pupil who does well in the lower grade finds, when he knocks at the door of the grade above, that his record has gone before him, and is there set to his credit. He finds, too, that the work of the school above is adapted to the training already given, and the promise of all this has been his encouragement from the beginning."

XVI.—STATISTICS.

POINTS FOR CONSTANT CONSIDERATION IN THE STATISTICS OF EDUCATION.

[*Report of the Committee on Educational Statistics of the National Council of Education, presented by Hon. John Eaton.*]¹

1. Statistics of education are not to be regarded as of greater value than the end for which they are kept. We do not educate that we may keep statistics, but we gather statistics that we may know better how to educate.

2. Statistics of education can not give completely that wonderful work in man. At best they must come short of the whole story of what education does, and its results. We should not expect from them what there is not in them.

3. We should neither overestimate them nor underestimate them, nor put them out of place in our plans or efforts. If a teacher may lay down his life for his pupils, he certainly should not, in a struggle simply to perfect his statistics. Better sacrifice the record of a school than the children in it.

4. Numerals are not the whole of statistics. There must be description or descriptive texts enough for their correct understanding and interpretation; graphics may add much to their value.

5. Whatever adaptation to local peculiarities with respect of what statistics include or exclude, the more they approach to a universal language the better. The progress of statistics towards the universal may foreshadow the international in law, commerce, and, generally, in intercourse among communities and nations and the possibilities of universal peace. How long has the measuring of social and civil forces been subordinated to the problems of war? How long have war statistics been to the front? Why has not the time come to bring to the front statistics tending to peace, of which the educational are the most central and significant of other conditions, showing the power in their individual or collective capacity in respect to all that pertains to human progress

¹National Council of Education—Proceedings, 1887, p. 60.

in every department? Is not this precisely what has been going on for these fifty years? Compare educational statistics of to-day with those fifteen years old. The United States are in the way to lead in perfecting educational statistics. Are our institutions to be preserved? The knowledge of their value, the signs which point out the causes and prevention of peril, must be in possession of the people. Our affairs are not to be directed by a king or a class, but by a majority of all the people. Therefore the people, all the people, should be constantly studious of the vital interests which these statistics represent. Do farmers and seamen watch the storm signals? Every citizen should watch the signals of sociology. How stands the barometer of intelligence? Whither tend the currents? What are their velocity and force? No citizen should be ignorant or indifferent. He should not only see how his child or neighborhood stands, what the details of these facts are in themselves, but how they compare with others and with the best standards. This would have some effect on the universal boasting that my class, my school, my college, my city, my State is the best,—which we have *ad nauseam*.

6. The aiming towards larger or more universal bearings of statistics in education need not, and should not, take from their local meaning or lessons; but should add to them by affording larger range of comparisons. Each school, each district, ward, town, parish, borough, or city or county, each seminary, academy, college, university, should keep its statistics so as to accord with all others of similar character in its State; and each State should so keep its records as to compare in certain important particulars with those of every other State in our Union; indeed, every nation may so keep its statistics that they may have some accord, some fair ground of comparison, with those of every other nation.

7. Statistics of education should be, in form and nomenclature, not only to be compared with themselves, but with statistics representing other sociological conditions. They should not only show what the school attendance and the school work performed are in a given civil unit, district, ward, city, etc., but what the school population is; and at once furnish a safe basis of comparison, first as to illiteracy, second as to morals, crime, etc., third as to health, sickness, longevity, and so forth.

8. It should not be forgotten that statistics of education in the United States are not primarily authoritatively secured by the same agency; and in bringing them into comparison, all essential differences should be regarded. The nation has gathered certain facts about education for a series of decades; each State, also, now has its statistics of education; moreover, certain municipalities report special items for their own benefit; besides, private institutions, whether chartered or not, have their own way of making the facts about themselves known. The National Bureau of Education, an agency for collecting and publishing statistics of education, has issued annually a Report since 1870; all reports to it are voluntary. But it has sought to utilize all authoritative collections of educational data and to give to each statement or collection the actual value of the authority or source from which it was derived. The Bureau has drawn from the United States censuses, State censuses, city school reports, and the authorized statements made by all classes of institutions. During the time of half a generation in which this work has gone forward systematically year by year, the points for constant consideration above enumerated have been kept in mind, and greater and greater approximation to them has been secured. Is it not time to revise what has already been accomplished and to take a step forward?

9. In working toward any ideal of statistics, it should be remembered how much is dependent upon legislation, and under what a variety of difficulties it must be accomplished in Congress, in the several States and Territories, and in numerous municipalities.

10. The great advantage of a national initiative is the last point that I wish to enumerate in this preliminary statement of the points for constant consideration in the statistics of education. If this council can agree thus far, may it not be prepared to go forward at a future time in a specific enumeration of what educational statistics should include, and in what periods and in what manner they should be recorded, collected, and published?

More accurate and reliable under a township system.—Superintendent Raab, of Illinois: "What is true in mechanical affairs is equally true in intellectual affairs—the simpler the machinery the more effective it is, and the less liable to get out of order. The gathering of the general and financial statistics of the schools of the State, as at present conducted, is a difficult task, and their accuracy is in an inverse ratio to the difficulties under which it is accomplished. To most boards of directors, because it is an unusual task to them, the reports to the trustees cause a great deal of annoyance, and because the work is done unwillingly the reports are made late, thus preventing the boards of trustees from making their reports to the county superintendents in time. What an amount of time and labor could be saved, and how much could the accuracy and reliability of these statistics be increased, if one report from each township were to be made to the county superintendent, embracing in one document the data which now have to be collected by from six to ten boards of directors."

Registers not correctly kept.—Superintendent Bell, of Monroe County, Iowa: "In 1885 a careful inspection of the school registers revealed the fact that about three-fourths of them were not correctly kept. As a consequence, at least that ratio of reports to district secretaries must have been incorrect. What reliance, then, can be placed in the school statistics of the whole State, if those from Monroe County are an average in point of correctness?"

Penalty for failure to report.—Superintendent Moody, of Idaho, writes to the Bureau: "I regret exceedingly that I can not give more complete statistics. The neglect of the trustees is at the bottom of the trouble. The only penalty that I can inflict is to withdraw the apportionment of non-reporting districts, and I am loth to take such a step for the reason that it deprives the children of educational facilities without making the real culprit suffer."

Private schools should be required to report.—Superintendent Orr, of Georgia: "As the private high schools, and perhaps to a small extent the private elementary schools, are likely to remain in coming years a portion of our educational machinery, I think some mode ought to be provided whereby a report of what they are accomplishing may be obtained. Though they are private enterprises I can see no wrong in requiring them to give information in which the entire public is deeply interested. This principle is recognized in all census legislation. Private persons are required to give such information as is of vital interest to the public."

XVII.—SUPERVISION.

Essential elements of supervision.—Superintendent Dutton, of New Haven, Conn.: "Our schools could never have reached their present high rank had it not been for the careful supervision of the principals of all the school-rooms in their several sub-districts. The quiet, satisfactory, and thorough manner in which the schools are conducted from year to year is a sufficient proof of the excellence of the system. The only possible danger is that principals may suffer their time and energies to be too much absorbed by clerical duties and by sundry details that are always claiming attention. To be much in the school-rooms, to bring judgment and experience to bear in weighing the merits of the actual teaching, and to offer suggestions and criticisms without reserve, as opportunity requires,—these constitute the essential elements of that immediate oversight which principals are expected to give. To help the weaker and less talented teachers to become as good as the average, and to deal frankly with all that savors of incompetency, is the best service that a supervisor can render his patrons. He will also endeavor to secure a full and punctual attendance of the pupils in his district. He will see that the programmes are so arranged that the several subjects of study receive due attention. He will conduct such examinations, oral and written, as are needed to keep him well informed concerning the advancement of the several classes."

Well considered and thoughtful economy.—Superintendent Nelson, of Michigan: "As might be anticipated, experience demonstrates the efficiency and value of an enlightened supervision of any and every system of public instruction. Our cities wisely intrust this supervision to a single person. The advantages of this method of organization are quite obvious, and are well certified by prolonged experience. It secures unity, it inspires emulation, it promotes a nobler standard of merit, it commands more intelligent and competent teaching gifts. It seems rational to anticipate that a similar supervision of rural schools would tend to the accomplishment of similar results. Some system of county superintendence, well remunerated, and, so far as possible, removed from the petty jealousies and intrigues of political partisanship, would be undoubtedly, a measure of wise and needed legislation. Objections raised on the score of economy are scarcely pertinent. It may be doubted whether it would add a farthing's weight to the burden of school taxation. Yet, if so, is the objection really valid and worthy of serious consideration? Not in a free commonwealth whose very existence depends upon the intelligence and virtue of its people. Extravagance in government expenditure is pernicious, no doubt; but unstinted and generous provision for the maintenance of free schools is not extravagance. The rather, it is well considered and thoughtful economy. As truly as 'the life is in the blood,' so free governments subsist by free schools. Whatever they cost, it is the price which we must inevitably pay for our immunity from the evils of anarchy or despotism."

County superintendents in Illinois.—Superintendent Raab: "Whenever the teachers of the State had an opportunity of expressing their approval of the recent amendments to the school law respecting the county superintendency, they have done so in the most unqualified terms, and the reports concerning the working of these amendments coming from the different counties are unanimously commendatory. * * * Heretofore only

a few favored counties gave their superintendents time to visit schools and pay therefor; in the rest of them the county superintendent was reduced to a mere clerk, who had to keep accounts, to conduct teachers' examinations and grant certificates, and to make reports. Now, all over the State, the county superintendent is what his name implies—an overseer of the schools of the county—and this happy change for the better will be felt, I hope, in the remotest nooks and corners, thus tending to equalize the benefits of education and making the population of the State more homogeneous."

County superintendents needed in Arkansas.—Superintendent Thompson, of Arkansas, says: "The more I see of the actual work of our schools, the more fully am I convinced that one of the greatest wants of the public school system of Arkansas is intelligent county supervision."

Most fruitful of good results.—Superintendent Lawhead, of Kansas: "In school work, as in other departments, system is essential to the accomplishment of the highest results, and this is best secured by means of a well-devised supervision. Our method of supervision by county superintendents is, in my opinion, the most fruitful of good results that has been tried, and when our people shall come to appreciate the importance of that office and realize what a power it may be made for the improvement of our schools, I believe they will select their superintendent with more care than any other officer."

Beneficial effects noticeable.—Superintendent Finger, of North Carolina: "The beneficial effects of superintendence is specially noticeable in many counties in this State, in which, even with small pay, active and competent men have been induced to work in this line. I am glad to state that much more progress has been made in such counties than in those in which superintendents have not been so active, but have held their places mainly as examiners of teachers."

Tenure of office of county superintendents.—Superintendent Cornell, of Colorado: "The condition of the schools is largely dependent upon the county superintendents. This is especially true of the country schools, and in no department of the educational work is there more need of able supervision than in these schools. A judicious, earnest, and capable county superintendent can do much toward improving the schools of his county, but it requires earnest effort. It is sometimes said that the office of the county superintendent is not appreciated. It is called an unimportant office. The importance of the office depends upon how it is filled. The county superintendent has it in his power to render the office one of great value, and compel the people to acknowledge its importance. * * * Unfortunately, changes in this office occur too frequently for the good of the schools. When a county superintendent holds the office but two years, he has but little time to mature and carry out plans. It takes him one year at least to learn the wants and conditions of the schools of his county; then he has but little time left to carry out any methods for advancing the schools. For this reason, county superintendents who are doing good work should be retained as long as possible."

Pay of county superintendents.—Superintendent Welcker, of California: "In every county the superintendent of the schools should receive a decent and comfortable support, so that he may be contented, and able to give his whole time to his duties. His reasonable travelling expenses should be reimbursed to him. Certainly they should not be deducted from his salary, which, as said before, should be decent and comfortable. He should have certain days fixed for duty in his office, and the entire residue of his time should be given to continuous visitation of the schools. Then the teachers and trustees would know that they were being continually looked after. The teachers would feel that they had a professional friend to advise and sympathize with them—one capable of instructing and helping them. His frequent visits and constant supervision would create and preserve thorough organization; would infuse into the system all the new and valuable improvements evolved by experience everywhere, and would make the system consistent and homogeneous. His efforts would be those of an equalizer, to raise the lowest school on to a level with the highest, and to make them everywhere good."

"It will be objected that many counties are too poor to pay their school superintendent a salary which will engage his whole time in their service; that they are too sparsely settled, and that they must wait till more money shall have been invested within their borders. The ready answer is that to have good schools in the county is the best invitation to settlement and investment; with population comes wealth, the enhancement of existing property, and the production of more. Let it be well understood that any county, even the remotest and least developed, has superior schools, and the fact will give an immediate and great impulse to migration thither. Now, this great desideratum may be had by simply paying one officer a decent salary."

Effect of politics.—A four years' term for county superintendents recommended.—Superintendent Akers, of Iowa: "The law should strengthen the office, and enlarge the powers of the county superintendent, keeping, of course, within safe and prudent limitations.

"The office is now greatly weakened by the political situation in many counties. However successful, competent, and faithful a superintendent may be, if the control of the county passes from one political party to another the experienced and successful officer is displaced, and a new and inexperienced man or woman, as the case may be, succeeds to the administration of the office.

"This is prejudicial to the interests of our schools and greatly retards progress.

"The success of educational work depends very largely upon organization. A change in the system of organization and management of the schools of a county, is always attended with confusion, and not infrequently results in a relapse of several years.

"It has been suggested from many sources that the county superintendency should be made a non-political office. Just how this may be done so as to improve upon our present method, is difficult to determine.

"The proposition to make the office appointive, either by the board of supervisors or any other county authority, has not been favorably received. It is by no means certain that this would either take the office out of politics or secure more competent officers. The county superintendent should be elected by the people. If this could be done at a non-partisan election, as for instance, at the school elections in March, it would be a great improvement over our present plan. The term of office, as I have heretofore suggested, should be four years instead of two. This would tend more to give the office strength and independence, than anything else that could now be done. Four years would allow sufficient time to develop and mature a plan of organization, and to test the fitness and ability of a superintendent. A system, if good and effective, would obtain a strong hold upon teachers and leave a lasting impression upon the schools of the county. Succeeding officers would find it more difficult to make radical changes in the work of the county, and in many cases they would adopt the system of their predecessors, and continue the work without material change or interruption. A term of four years would enable the superintendent to become well acquainted with school officers and the condition of schools throughout the county, as well as to become informed as to the character and teaching ability of teachers. He would become familiar with the school law, and his influence thus largely increased he would be able to settle amicably the petty troubles which are usually litigated to the great injury of the schools."

XVIII.—TEACHERS.

Average attendance as affecting teachers' salaries.—Superintendent Buchanan, of Virginia: "Objections are urged against the principle of regulating salaries by school attendance. Where it entails loss it begets complaint. But how to wisely and equitably adjust the matter of teachers' salaries is a difficult question. Interests are to be guarded which seem to be in conflict. On the one hand, it is urged that to subject teachers to reduction of pay for causes which they can not control, and without regard to the manner in which they discharge their duties, is manifestly unjust; that the number of pupils in a school is not necessarily a test of the teacher's efficiency or even popularity; that many causes affect school attendance, such as sparseness of population, indifference among patrons, real or fancied need of children's services at home, sickness, bad weather, bad roads, uncomfortable school-houses, etc.; that non-attendance from such causes should not diminish teachers' pay; that making salaries depend on average attendance tends to make teachers less independent, and therefore less inclined to exact thorough work of their pupils, enforce proper discipline, and discharge all other duties without fear or favor.

"The remedy suggested can be briefly stated. Place the schools where they ought to be, assign them the best teachers available, and pay the teachers the whole amount of salaries agreed upon. If a teacher proves inefficient, dismiss him and employ another. If the average attendance fall below a certain number, close the school.

"On the other hand, it is maintained that our school fund, being insufficient to furnish all the school facilities needed, ought to be so managed as to reach as many children as possible; that this cannot be done except on some such plan of regulating salaries on the basis of school attendance as now exists; that the public interests are to be guarded in the expenditure of public funds, as well as the interests of private individuals; that the principle which makes the amount of teachers' salaries independent of an efficient discharge of duty is vicious; that, as a rule, good teaching attracts more pupils than poor teaching, and ought to be better paid; that as teachers of private schools are, as a rule, dependent wholly on their patronage for their income, it is not unjust that public school teachers should be partly so."

Grading of teachers' salaries.—Superintendent Jones, of Dakota: "Teachers' salaries in our public schools should be graded to correspond with their certificates of qualifica-

tion. The plan has been thoroughly tested elsewhere, and found to work to great advantage. When schools are put up at auction—which is practically done in numerous instances—and teachers of the first grade are required, in order to secure a school, to underbid third grade and even probation teachers, it may well be concluded that our educational system requires looking after. We may now be looking too much to that which is showy and ornamental, and slighting that which is of material, practical value. It would be well to establish these salaries by law, as is done in California, had we a permanent school fund of reasonable proportions; but this being wanting, it would be well to provide for the grading being done in each county by a proper board, composed, for example, of the county superintendent and the chairmen of the various school boards, in order that the salaries fixed may be in proportion to the tuition fund to be expended, these funds now being of local origin."

Proposed service pension for teachers.—Superintendent Welcker, of California, in speaking of the necessity of keeping experienced teachers in the service, especially a due proportion of male teachers, says: "How shall we invite and retain the best of both sexes? How shall we secure the inestimable benefits of experience? By saying to the teachers, 'Here is a great and noble calling, which it has always been, but which henceforth will provide against destitution in old age.' The teacher has at present no cheerful outlook to the future. He fears the approach of old age, hand and hand with poverty, and sometimes he leaves and looks out for something else. Suppose that some reasonable pension after thirty years of faithful and successful service were granted to the teachers, say \$25 per month during the residue of his or her life. I mention a very low sum, indeed, to render this proposition, not merely to do justice, but to make a wise and economical investment for the State, less startling. It might be that the liberality of the people, as expressed by the Legislature, would prescribe a larger sum. But let us think of \$300 per annum. What a revolution that would create in the *personnel* of the profession!

"The intending teacher, man or woman, would say to himself or herself: 'Here is a noble calling in which for thirty years I can find a respectable living, and then when old age comes on, and possibly failing health, even at the worst I shall not starve!'

"They will be able to enter upon their life-work without fear and misgiving; they will be able to give themselves up to it unreservedly; to devote their whole energies to it, and to become year by year more and more valuable to the State. Could the State make wiser investment of its money?

"When we come to consider what would be the cost of so great a boon, we are surprised that it is so small. I have not the means of knowing exactly the number of teachers now on the rolls who have had 30 years of successful experience. But I think we may come pretty near it. The honor and advantages of a life diploma are so great that we may assume that as soon as a teacher is entitled to one he obtains it. Of the life diplomas on the rolls at this time there are but 18 which will be 20 years old at the expiring of this year, showing but 20 who have had 30 years' experience, even assuming them all to have continued teaching, which is by no means true. Then to start this beneficial measure into operation would cost but \$5,400 *per annum*! A sum so small that it could not be felt in the taxes of the State. No tax-payer in the State could discover from his own tax dues whether the appropriation had been made or not, and yet not since the opening of the first public school has there been a measure so fraught with good to the public."

The bane of our common schools.—Superintendent Mann, of Clay County, Iowa: "The bane of our common schools is, we have no teachers that enter the work as a vocation. The salaries paid to teachers will not warrant any person of energy in entering the work for any length of time. Consequently, our best teachers are constantly dropping out, and their places are being filled by young and inexperienced teachers."

Teachers should be able to rely with reasonable certainty upon employment.—Superintendent Buchanan, of Virginia: "Schools which experience frequent change of teachers are not the most progressive. Such changes are often inevitable, often expedient. Beyond this, they are to be avoided, as detrimental both to the schools and the teachers. A good many persons engage in teaching as a temporary expedient, looking in other directions for permanent or more lucrative employment. These, after a session or two, drop out, leaving their places to be filled by others.

"Again, there is a class of peripatetic teachers. They do not stay long in one place. Changes from these causes are unavoidable, and may also be expedient. At any rate it is always expedient to exchange an indifferent teacher for a good one. But when a teacher has proved faithful and efficient, has become acquainted in a neighborhood, has secured the confidence of the community, knows the capacities and temperaments of the pupils, and their different degrees of advancement in their studies, such teacher can begin a new term with manifest advantages over a new teacher, and for this reason as well as others, ought, in the interests of the patrons and pupils to be retained. But it is es-

pecially due teachers that they, having chosen teaching as a profession, and proven themselves competent, worthy, and efficient, should be able to rely with reasonable certainty on employment, and thus be relieved as far as practicable of suspense and anxiety in regard thereto. If ability, skill, energy, and good character secure steady employment in other pursuits, they ought especially to do so in that of teaching."

Length of service not always an advantage.—Superintendent Hinsdale, of Cleveland, Ohio: "There is, no doubt, a considerable probability that a person who teaches many years will acquire considerable skill as a teacher; but when one remembers how many persons never make progress in any occupation beyond the initial steps, and how deadening to the mind routine is when care is not taken to keep the mind fresh and elastic, as well as how many teachers fall into routine, he must see that time in the service and skill in teaching are very different things. Sometimes length of service is a positive disadvantage, owing to the influences just set forth; and there is reason to think the tendency in this direction is especially strong in lower-grade work, where the field is narrow and routine benumbing. Some teachers are less efficient at the end of 20 years than they were at the end of 10. At the end of 1 year, some teachers have more experience in the best sense, than others at the end of 10 or 20 years; and, it may be said, some persons who have never taught a day are better teachers potentially than others are actually who have served half a lifetime. In fact, one is often surprised to see how quickly young persons of scholarship, aptness for teaching, and character take very high rank as teachers as he is to observe how many of the greatest teachers have been very young men.

* * * * *

"Touching the teacher's experience, then, the main question is not '*How much experience have you had?*' but '*What kind of an experience has it been?*' Not '*How long have you taught?*' but '*What have you learned about teaching?*'"

"All this has an intimate bearing on a question now much discussed. That something should be done to make teachers' tenures more fixed and lasting, and so to protect them from the predatory habits of those who prey upon them, goes without argument; but those who are seeking to solve the problem should not overlook the danger at the other extreme. An arrangement to keep all teachers who are once elected in, is not a solution of the tenure problem. That solution also includes the protection of the public and the schools against teachers who have proved failures."

The one thing most effective.—Superintendent Bayes, of Dubuque County, Iowa: "Probably the one thing more than any other that has enhanced the usefulness of our schools, is an unwritten rule of action among our boards of directors regarding the teachers' tenure of office. It is generally understood among them that when a teacher is once employed in a district his claim for reappointment shall take precedence of all others, in case he gives reasonable satisfaction."

Competent teachers should be retained.—Superintendent Williams, of Delaware: "Another obstacle to success is the frequent change of teachers in many school districts. This greatly embarrasses the work of our school system. It must be admitted that an incompetent teacher should be superseded by a better one, but other things being equal, pupils will learn more from a teacher with whose methods they are familiar, than from a new one. If a teacher has succeeded well, has evinced skill, industry, and intelligence, it is, almost without exception, a decided detriment to change. When the services of a thoroughly competent teacher have been secured, they should be retained from term to term, and the question of wages, whether a few dollars more or less per month, is of small consequence."

Cannot afford to stop the pruning.—Superintendent Preston, of Mississippi: "We must not look simply to the saving of money, and the consequent ability to lengthen the term of our schools. Our public school system improves only as the teaching force performs its function better, and there can be no doubt that with rigid, impartial examinations, with institutes, with real supervision and inspection of their work, our teachers will be stimulated to broader and more accurate scholarship, and to a more faithful performance of their duties. The sacred duty of the State is to see that the best possible corps of teachers is obtained, and she fails in her obligations to tax-payers and to her children in every instance where an incompetent teacher is placed in charge of a school. Every energy should be utilized to remove the incompetent, and to stimulate the efficient teacher to his best efforts. We have vigorously used the pruning hook during the past year, and better fruit will be the result. We cannot afford to stop the pruning because of the clamor of the falling branches. They bore no fruit and we cannot stop to listen to them, or their friends, or their kindred."

There are reasons for preferring male teachers.—Superintendent Buchanan, of Virginia: "At the same [present] rate of increase our schools in a few years will be pretty largely

in the hands of female teachers. No unfavorable comment is to be made on this tendency, yet it ought not to go too far. Intelligent and careful observation accords to women, as teachers, the possession of equal tact, skill and fidelity with men. For instructing younger children, especially, they are by natural endowments better fitted than men. They have met with good success also in more advanced work. But for schools composed of older pupils, where a somewhat vigorous discipline is necessary, there are reasons for preferring male teachers."

No one has a "right" to a position in a school.—Superintendent Stockwell, of Rhode Island: "One great obstacle in some of our cities and towns to the employment of a better class of talent, is that by a sort of unwritten law residents of the place are supposed to have a sort of pre-emptive right to the position of teacher, and so they present their 'claims' and they are elected. Now, no one should be allowed to entertain the notion that he has any 'right' to a position in a school. 'Other things being equal,' as is sometimes said, it is well enough to give a preference to residents, but even then there is a liability of a dangerous precedent creeping in and establishing itself. The committee should always keep the matter of appointments so completely in their hands as never to feel bound to any one, except to the best one that can be found for the salary to be paid.

"Moreover, there is oftentimes great advantage to be gained by introducing into a system of schools teachers who have been trained in a different way, in another atmosphere, under different minds. By so doing new ideas and methods, a new spirit and life are set at work, and progress is the inevitable result."

How security in position is to be attained.—Superintendent Stockwell, of Rhode Island: "Security in position for the teacher, not so much through a 'tenure-of-office' law as by the fact that the power to hire and to discharge is in the hands of a board specially chosen for the work, and if not specially qualified at the outset, very soon becoming so in the discharge of their duties, and governed, as a rule, solely by the desire to secure the best service for the means at command, is the result to be looked for."

A teacher should not be allowed to learn to teach at the expense of the children.—Superintendent Preston, of Mississippi: "If a man should undertake to operate a machine shop with hands gathered in from the cotton fields, his speedy failure would teach him a pointed lesson of experience, viz, that he should have selected skilled workmen. Can we, then, expect to operate the complex machinery of a school system without providing a reliable and strict test of the capacity of those artisans who are to labor in our great intellectual workshop?"

"In the expenditure of large means in any important enterprise, the worst and unwise economy is that which fails to provide the necessary agencies and appliances to utilize all the forces which contribute to successful results. Yet the State had ignored that 'a poor teacher is worse than no teacher,' a maxim which is embedded in the very heart of all educational philosophy, and which has been demonstrated by the experiments of all States that have developed a system of public instruction.

"No person should be permitted to teach in a public school without a valid license issued by an agent of the State, after a careful test examination. A teacher should not be allowed to learn to teach at the expense of the children, robbing them of their time and opportunities by his futile experiments and fatal blunders."

XIX.—TEMPERANCE INSTRUCTION.

Present status of temperance instruction.—In the autumn of 1887 the following inquiry was addressed to State superintendents: "Is the study of physiology and hygiene with special reference to the effects of stimulants and narcotics required by law, and in what grades?" The following replies were received up to the time of going to press, the remarks within parentheses being added by the Bureau:

North Atlantic Division—

MAINE.—Yes; in all grades. (Laws of Maine relating to public schools, 1885, p. 31.)

NEW HAMPSHIRE.—Yes; in all grades sufficiently advanced. (Laws of New Hampshire relating to common schools, 1886, p. 66.)

VERMONT.—It is required by law to be taught to all scholars, in every grade. (Act approved November 24, 1886, repealing previous acts.)

MASSACHUSETTS.—It is required by law and in all grades. (Act approved June 16, 1885.)

RHODE ISLAND.—Yes; in all grades. (Public laws, January session, 1884.)

CONNECTICUT.—It is required in all grades. (Laws of the State of Connecticut relating to education, 1886, Chap. III, sec. 5, p. 15.)

North Atlantic Division—Continued.

- NEW YORK.—Yes; grades not specified. (Act passed March 10, 1884. General School Laws of the State of New York, 1886, p. 125.)
 NEW JERSEY.—(No law upon the subject, so far as known to the Bureau.)
 PENNSYLVANIA.—In all grades. (Act of April 2, 1885. Pennsylvania School Laws and Decisions, 1885, p. 113.)

South Atlantic Division—

- DELAWARE.—Yes. (Act of April 12, 1887, requires the above instruction to be given to all pupils in all public schools.)
 MARYLAND.—Fifth grade and all grades above the fifth. (Act of April 5, 1886.)
 DISTRICT OF COLUMBIA.—Required by United States law in all grades. (Act of May 20, 1886.)
 VIRGINIA.—Not required.
 WEST VIRGINIA.—Shall be taught in all the free schools.
 NORTH CAROLINA.—Named (*i. e.*, physiology and hygiene) as one of the public school branches to be used at option of pupils, but all teachers are examined on the subject as on other subjects. (Public School Law of North Carolina, 1887, p. 25.)
 SOUTH CAROLINA.—Yes; matter of grade left to local authority; no general rule.
 GEORGIA.—(No law upon the subject known to the Bureau.)
 FLORIDA.—By the regulations made by the State board of education, all schools are required to teach the evil effects, etc.

South Central Division—

- KENTUCKY.—General instruction to each school on laws of health. Text-book on physiology and hygiene in highest class in common schools. (The Common School Laws of Kentucky, 1886, p. 15.)
 TENNESSEE.—(No law upon the subject known to the Bureau.)
 ALABAMA.—Yes; in first and second grades. (Public School Laws of Alabama, 1885, p. 26.)
 MISSISSIPPI.—(The curriculum of the common schools of the State embraces, among other studies, the elements of physiology, without any special reference to stimulants and narcotics. Laws in Relation to Common Schools, secs. 48 and 51.)
 LOUISIANA.—(No law upon the subject known to the Bureau.)
 TEXAS.—No.
 ARKANSAS.—No.

North Central Division—

- OHIO.—No.
 INDIANA.—It is not required by law, but is generally taught in the fifth grade (eighth year).
 ILLINOIS.—Not especially required by law, but school authorities may prescribe such a study.
 MICHIGAN.—Yes; in all grades. (Amendments to the School Laws, 1887, p. 4.)
 WISCONSIN.—(Required in all grades. School Laws of Wisconsin, 1885, p. 73.)
 MINNESOTA.—Yes; generally in all grades. (The law does not specify the grades, but requires "systematic and regular" instruction. School Laws of Minnesota, 1887, p. 99.)
 IOWA.—Yes; in all grades and in all public schools. (Act approved February 17, 1886. Amendments to the School Laws of Iowa, 1886, p. 5.)
 MISSOURI.—Yes; in all grades. (This instruction must be given upon the demand of any patrons of the public schools, and only to the children of those so demanding it. School Laws of Missouri, 1885, sec. 7077.)
 DAKOTA.—(Required by United States law in all grades. Act of May 20, 1886.)
 NEBRASKA.—Yes; in all grades. (School Laws of Nebraska, 1885, p. 53.)
 KANSAS.—In all grades of all public schools. (Laws for the Regulation of the Common Schools, 1885, p. 92.)

Western Division—

- MONTANA.—(Required by United States law in all grades. Act of May 20, 1886.)
 WYOMING.—Same.
 COLORADO.—Yes; grades not specified. (To take effect July 3, 1887. School Law of Colorado, 1887, pp. 3 and 65.)
 NEW MEXICO.—(Required by United States law in all grades. Act of May 20, 1886.)
 ARIZONA.—Same.
 UTAH.—Same.
 IDAHO.—Same.
 WASHINGTON.—Same,

Western Division—Continued.

NEVADA.—It is, in all grades, but is too much neglected by county schools. (School Laws of Nevada, 1885, p. 7.)

OREGON.—Yes: in all grades. (Amended School Laws of Oregon, 1887, p. 34.)

CALIFORNIA.—Yes; in all grades. (School Law of California, 1887, p. 25.)

Summary.—From the above replies it will be seen that instruction in physiology and hygiene with special reference to the effects of stimulants and narcotics is made compulsory by statute in some part of their school life on all pupils in 24 out of the 38 States, viz: Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, Pennsylvania, Delaware, Maryland, West Virginia, South Carolina, Florida, Alabama, Michigan, Wisconsin, Minnesota, Iowa, Nebraska, Kansas, Colorado, Nevada, Oregon, and California; reference has been made to the statute whenever it could be found by the Bureau. The same compulsion exists in all the Territories and in the District of Columbia by United States statute. In Missouri the instruction under consideration is compulsory upon the demand of patrons of the public schools and forbidden otherwise.¹

Reports of Pennsylvania county superintendents on the operation of the new law.—Adams County: "The study of physiology and hygiene met with considerable opposition in certain quarters, but it was owing mainly to a misapprehension of the intent and purpose of the law, and a want of proper judgment on the part of teachers and directors in introducing it in the schools. The people everywhere entertain a commendable respect for law and authority, yet they are apt to chafe under supposed arbitrary exercise of power. Upon the whole the results of this new branch of study have thus far been most satisfactory."

Carbon County: "Little or no trouble has been caused by the introduction of physiology and hygiene into the schools, and the teaching of the branch has been fully equal to that of the teaching of any of the other branches."

Clarion County: "Physiology and hygiene has been taught in all the schools. The new study met with some opposition in places, but is rapidly gaining a foothold in the public schools of this county. Teachers are learning how to teach it better, and parents are becoming better satisfied with the results."

Clinton County: "The new branch of physiology and hygiene met with considerable opposition the past year."

Dauphin County: "The new law requiring physiology and hygiene to be taught has been obeyed in all the districts of the county. Text-books were not used by all the pupils, but suitable oral instruction was given in the subject where pupils were not competent to use the book. I am of the opinion that in some cases text-books were used when oral instruction would have accomplished better results."

Monroe County: "About the only drawback experienced was in the introduction of the new branch of study—physiology and hygiene. It was not very favorably received by the people, and a great many parents refused to supply their children with books, so that it became necessary, in such cases to teach it by the oral method. In fact this was the only way in which it could be taught to quite young pupils who had not yet learned to read, or to those who had been in school but a year or two. Such, I take it, is not the letter, nor indeed the spirit, of the law, but it is the best that can be done and it is the best that ought to be attempted."

Potter County: "That physiology shall be studied seems now to have become an accepted fact, and with a few slight exceptions our teachers report no opposition in carrying out the law."

Susquehanna County: "Physiology and hygiene is growing in popularity with both schools and people. It is impossible, however, to act up to the letter of the law in some localities; the general use of the branch by oral exercises being the only undertaking practicable."

Wayne County: "Physiology and hygiene was taught in all the schools, with varied success. We believe much good will follow the study of this branch."

Recommended in Minnesota.—Superintendent Kiehle: "In view of the alarming spread of intemperance and the devastation it is working in the State and in the home, in the bodies and in the minds of men, fostering all vice and destructive of all thrift and virtue, in addition to the restraints imposed by law, the youth should be instructed in the natural and necessary effects of stimulants and narcotics. I recommend that a law be enacted requiring the teachers of youth to include in their instruction in hygiene careful teaching in the nature of narcotics and stimulants, and the evil effects of their use."

¹ Though the matter does not chronologically come within the scope of the present Report, it may be remarked that the General Assembly of Ohio enacted a law April 11, 1888, requiring "the nature of alcoholic drinks and narcotics, and their effects on the human system, in connection with the subjects of physiology and hygiene," to be "included in the branches to be regularly taught in the common schools" of the State. Oral instruction is to be considered sufficient compliance.

Over-teaching is perilous.—Superintendent Nelson, of Michigan: "In my opinion, it is the design of the law to give to this class of studies the same *status* it gives to other practical topics, such as reading or grammar, *i. e.*, that somewhere in his course, the pupil shall be taught the physiological and moral effects of narcotics and alcoholic stimulants upon the whole being of man. To my mind, this is quite enough. Less would be insufficient; more would be unnecessary, and possibly harmful. It is to be regretted that in any public school the full requirements of the law should suffer neglect; yet, it would be a mistake quite as serious, to give to these special studies a disproportionate, unequal place in the school curriculum—to co-ordinate them, as some extremists insist upon doing, with every other subject from the low zones of a, b, c, up to the high regions of calculus. *Over-teaching* upon a subject which relates to moral conduct, especially if it concerns the appetites or passions, is really perilous. Too constant dwelling upon topics of this character has a tendency to invoke morbid conditions in the mind of the youth which either provokes or fascinates him to attempt dangerous experiments. Were you to teach a boy the flagrant wickedness of burglary it would not be expedient, nor would it be necessary, to induct him into the mysteries of picking a lock. The *specialist* finds a peculiar charm in the ugly spider—he sees a thousand beauties in the bright colors and sinister eyes of a loathsome snake. We may well fear the consequences of making our boys and girls too familiar with nauseating details of any evil which we desire them to shun. The teacher or parent cannot be too earnest to enjoin correct principles, to give warning of penalties, and to himself exhibit a blameless example; which having done, he can effectively add nothing further, except to devoutly leave the result with God."

In Kansas.—Superintendent Lawhead remarks: "A vigorous mind inhabiting a healthy body can do more for the State than the same mind can in a body that is weak and diseased; and as the public school is sustained at public expense upon the theory that the permanency of the State depends upon the intelligence of its citizens, the State claims the right to have those branches taught in her schools that will best secure these results. Now a thorough knowledge of the human system is essential to its preservation and highest development, which can only be secured by a study of its physiology and hygiene, and the effects of such substances as may be deleterious to its growth and the healthy exercise of its various functions; and it has been decided by the best medical authority, as well as by universal observation of mankind, that both alcoholic stimulants and narcotics exert a baneful and destructive influence, not only upon the body and its various functions, but it likewise destroys the intellect and deadens the moral sensibilities. In view of all these results, we, as school officers and good citizens, should unite to make the teaching of the effects of alcoholic stimulants and narcotics upon the human system a success. We should supply our teachers with all the necessary appliances to secure the best results, and furnish our schools with the best maps, charts, and books, to enable the teacher to perform his part in this great work. I am pleased to note that teachers throughout the State have, in most instances, taken hold of this subject with an earnestness that is full of promise for good results."

Action to secure proper text-books.—Report (1887) of Iowa State Board of Health: "The law enacted by the Twenty-first General Assembly requiring physiology and hygiene to be taught in the public schools, with special reference to the effect of alcoholic drinks, stimulants, and narcotics upon the human system, was a step in the right direction toward the preservation of public health. Experience, since the passage of the law, has shown an important omission therein. No provision is made to protect the public against the mercenary wiles of unscrupulous book-makers and the propagation of error.

"Books on physiology and hygiene generally need no approval nor censorship, but when the law requires that they shall treat upon the effect of alcohol and narcotics upon the human system, it becomes important that the subjects shall be given truthfully. It can be readily seen that unless the approval of some reliable board or censorship be secured, a class of books might be introduced in the public schools, at least in some sections, most pernicious and erroneous in their teachings.

"In view of the apparent importance of this matter the State board, at its May meeting in 1886, unanimously adopted the following resolution:

"*Resolved*, That a committee of three be appointed by the president to examine the various publications on physiology now in use in the public schools in Iowa under the provisions of Chapter 1, Acts of the Twenty-first General Assembly, and such other publications as they may deem proper with a view to recommend to the next General Assembly the adoption of a series on said subject best calculated to furnish correct knowledge upon the subjects required to be taught by said chapter, and to report at the next regular meeting of this board, with such recommendations as they shall deem proper.

"It is not the purpose of the State board to select or recommend any particular publications, but to secure such supervision as will prevent the introduction into the schools of erroneous ideas."

May be made interesting and profitable.—W. W. Hyde, acting visitor of Hartford, Conn.: "While there seems to be good ground for regretting that this study is to be forced into our schools, and also good reason to doubt whether it will be of any advantage in the direction hoped for by its promoters, yet if we are to teach it at all, it must be in a systematic and thorough way. The whole subject can easily be made ridiculous, and of no value; but we hope by the exercise of care to make this study, like all others, interesting and profitable to the pupils."

For other information coming under this head consult the Index.

XX.—TEXT-BOOKS.

An argument for State uniformity.—Superintendent Baker, of Texas: "I again most earnestly recommend that provision be made for uniformity in school books. I fear that gentlemen of the Legislature have not heretofore realized the enormous expense attending the present mode of selecting books. Whatever interested parties may say as to the merits and demerits of the various publications, the best educators know that all school books now in use are nearly of equal merit, and that it is a matter of small importance which a child may use. It is rather a question of expense than one of the merits of the various books. My views, expressed in other reports upon this subject, have undergone no change. The years that have passed have strengthened me in the belief that the demand for uniformity is imperative. The sum annually expended for school books can not fall short of half a million dollars. Not only do the frequent and unnecessary changes in books help to make up this large sum, but the prices demanded for the books are unreasonable and extortionate. These prices are a grievous burden to the poor parent, and instances are not wanting in which they have effectually barred the door of the school-house against the poor. I admit that other States have failed in efforts to remedy this evil, but I believe that the failures can be safely attributed to a want of nerve and perseverance. The State has assumed the power to maintain public schools, and the right to manage and make rules for their government follows. It is said that the right of the parent to select the books his child shall study should not be taken away; that popular prejudice is against the proposition. The universal demand for uniformity shows that the argument is without foundation. Besides, it is a well known fact that it is not the parent, but the teacher, who selects the books. Other benefits would also arise from uniformity. The superintendent of public instruction, knowing the books that would be in use in a certain county, would be able to prescribe a course of study for the schools of that county, and thus practically *grade* the country schools. As the matter now stands, with all sorts of books in every school, he can not do so; the result being that the cities with graded schools march smoothly on, while the rural schools scamper hither and thither without object or aim."

Superintendent Harvey, of Chester County, Pa.: "While district uniformity is entirely proper, I have no faith whatever in State or county uniformity."

Uniformity desired in Arkansas.—Superintendent Thompson writes: "The importance of this subject demands the earnest, thoughtful consideration of every friend of economy and progress in our public schools. All admit that text-books have ever been a source of annoyance to parent and teacher. Parents complaining because they are called on to buy some new book when they think their children have old ones that are as good, if not better, than the new ones. Teachers complaining and discouraged because the children have no books, or, if they have, some are old and almost worn out and worthless, and others have an entirely different one. This want of uniformity in books, necessitates the forming of too many classes. The teacher knows at the time, he can not be successful in his work, when his time is so completely occupied with giving only a few minutes to each class. If these pupils had the same book, the classes could be consolidated, and more time given to each recitation. The complaint made by parents is reasonable, since there is no doubt that too many books are asked for by teachers—too many changes are required."

State uniformity in Indiana.—Superintendent Holcombe, of Indiana: "Several expedients for securing uniform text-books at the cheapest rates have been tried in other States. One of these is the State list, the books to be used in all the schools being prescribed by a central board or committee. This plan was tried for ten years in Indiana, but was never successful. The selections of the State board were generally disregarded in the more progressive schools, and the provision of the law requiring such selection was repealed in 1865.

"Another plan is the State contract system, by which the State controls the manufacture, distribution, and sale of books. The merits claimed for it are that perfect uniformity in books is secured throughout the entire State, and that books are supplied to

the pupils at manufacturers' wholesale rates. Experience and opinion, however, seem adverse to both these plans."

Township uniformity desired—*Experience of East Saginaw with free text-books.*—Superintendent Nelson, of Michigan: "The adoption of the township system will, in my opinion, open a new way for the speedy adjustment of the difficulties arising out of the diversity and expense of text-books. There can be no question that the variety of the text-books in use in our public schools is one of the most fruitful sources of dissatisfaction to the patrons of the schools and a very serious obstacle to securing the best results in school work. This is especially apparent in our ungraded district schools, where frequently the number of text-books on some one subject will equal the number of children enrolled in the school. The disadvantages of such a diversity are too apparent to need any argument. How best to secure some degree of uniformity and at the same time reduce the cost of the text-books to a minimum is a question of great importance to the educational interests of the State.

"After thoughtful consideration of the various plans and expedients suggested I am convinced that the solution of the problem lies in the consolidation of the school districts of each township and placing all the schools under the control of a township board of education and having a uniform series of text-books for the township, all such books to be purchased by the township district and loaned to the pupils under such regulations as the board of education may prescribe. The advantages that would naturally follow making the township the unit in school matters are referred to elsewhere in this report. The best argument in favor of free text-books will be found in the universal approval that this plan has received in localities where it has been tried.

* * * * *

"East Saginaw is the only city in this State where the pupils of the public schools are furnished text-books and stationery. By special act of the Legislature of 1885, the board of education was given authority to purchase text-books and all the necessary supplies for all scholars attending the public schools. The plan has therefore been in operation less than two years. That it has proved satisfactory is shown by the following statement from Mr. C. B. Thomas, city superintendent:

"The free text-book plan was adopted here in June, 1885. It has therefore been in operation about a year and a half. In this time we have pretty nearly completed our plant—i. e., bought a stock of books, slate and lead pencils, pens and pen-holders, writing and drawing books, paper and pads, etc., etc., for two years.

"Our total expense for the stock is about \$7,000; about \$4,500 last year, and \$2,500 thus far this year. Suppose we call it in round numbers for the two years \$8,000.

"Our school enrolment is or will be 4,500. The figures then stand thus:

Amount invested in books, etc	\$8,000
Number of pupils supplied.....	4,500
Cost per pupil.....	\$1.77

"Our books after two years' service will be in excellent condition. Even the first readers, in the hands of little children six years of age, after a full year's service, are sound, not much soiled, and good for a year or two more of similar careful usage.

"The advantages of the system may be summed up about as follows:

"1. A gain of from 25 per cent. to 40 per cent. on first cost.

"2. A gain of at least 33 per cent. in the time the book will be usable.

"3. I think, taking the last two items together, we make a gain of not far from 50 per cent. in cost to community.

"4. Classes are uniformly supplied, both as to time and material.

"5. No distinction between rich and poor.

"6. I am quite confident that about \$0.50 per scholar will keep the stock good, the children always furnished.

"7. To insure care, we fine children who needlessly or maliciously injure books in their hands."

"I would suggest that the law be amended so as to empower any district to authorize the purchasing of text-books for use in the schools of the district and am satisfied that wherever tried it will result in an increased attendance, better instruction, and cheaper books."

Enforced uniformity in every school of a county.—Superintendent Preston, of Mississippi: "A law without a penalty is a mere exhortation and may induce the timid to comply; but it has no power to loosen the parental grip on a dime which is asked for by the child who wants a new first reader—especially when there is on hand an old one which has served the father and possibly one or two of the older children. So the child goes to school and is ready to be classed with ten others who have books alike. The teacher must devote an undue proportion of time to this one pupil, or neglect him altogether. I cite this as a simple illustration of what exists in nearly every school in the State

Every teacher has encountered this obstacle to successful work, and has been powerless to remove it. If we determine to touch this subject by legislation, and I think no one will question the propriety and necessity of doing so, we should pass a law with a penalty, and have enforced uniformity in every school of a county, except those of separate school districts. These should conform as nearly as possible to the county adoption; but from the nature of their organization they should be allowed to select books suited to their particular wants."

A strong argument for free text-books.—Superintendent Strayer, of Cambria County, Pa.: "The want of uniformity in text-books prevents classification in a few districts. Constant change of teachers and pupils from different districts hinders classification. Here is a strong argument for free text-books. Is it right that teachers and pupils should be required to purchase books when a change of school or residence is made? The same principle that makes tuition free should make every department of our common school system free. The plan is in successful operation in the most progressive boroughs and districts in the county, and a few more years will doubtless witness a general adoption of free books and school supplies throughout the county and State."

The law should be mandatory.—Superintendent McNeal, of Dauphin County, Pa.: "Two districts, Conewago and Lower Swatara, have for several years furnished free text-books. Since the Legislature affirmed the power of school boards to do this, several other districts are gradually adopting the plan by furnishing the books in one or more branch each year.

"In our opinion the law should have been mandatory instead of permissive, and it is a matter of only a few years until it will be so amended.

"The policy has been thoroughly tested in the districts named, and the people are fully convinced of its wisdom as a measure of economy. It has been proven that the average annual cost to each taxable in furnishing all the books used in the schools is less than thirty-three cents. While this is the most forcible argument in favor of free books that can be used with the tax-payers, those engaged in school work know that the plan has many more advantages. It is the only practical question pertaining to school text-books. With free books, county and State uniformity is neither necessary nor desirable."

In Colorado.—Superintendent Cornell says: "There is a strong and growing sentiment in this State in favor of school districts purchasing and owning the text-books. The frequent changes that our people make from one locality to another has caused the purchase of text-books to become a burden."

Give unqualified satisfaction in Minnesota.—Superintendent Kiehle: "The provision for text-books is usually borne by the pupils or their parents.

"In the aggregate, the cost of books is not great when compared with the cost of instruction, but to the individual it may be so heavy a burden that, when, to the cost of maintaining children, the cost of school books is added, it becomes a serious obstacle to prevent them from availing themselves of what is otherwise a free school.

"For this and other reasons, the plan has been adopted in many cities and in several States, permitting the districts or townships to supply free text-books to all the children. The districts that have made thorough trial of this plan report their unqualified satisfaction.

* * * * *

"In view of the advantages to our education in increasing attendance, in cheapening the price of books, in improving the instruction and grading by a full and prompt supply of text-books, all well attested by abundant testimony, I recommend the enactment of a law authorizing school districts to make purchase of such text-books and supplies as are necessary for the instruction of their pupils."

How the text-book question will be solved.—Superintendent Raab, of Illinois: "Various are the devices which have been proposed for the purpose of supplying cheap or free text-books to the pupils in our public schools, and every session of our legislature witnesses a number of bills for accomplishing this end. No doubt the text-book question may be a 'burning one' in some localities, but the remedy is to be sought in a different way than by legislation. Our text-book makers attempt too much; they want to make books, which, while they are manuals for the teacher, are also books for the children to study. These two objects can not very well be accomplished in one work. The teacher must know a great deal more than the pupil upon any subject to be taught, hence the book is unsatisfactory to him; and the book for the pupil need not contain what is intended for the teacher, hence the pupil has to pay much more for his book than is just and reasonable. * * * Our authors should endeavor (1) to put no more into school books than is necessary for the pupils, and (2) should keep the matter for pupils and teachers separate, *i. e.*, publish special manuals for the teacher. But this will not be the practice

as long as teachers are not prepared properly for their work *before* they begin to teach, and are not so trained that they can teach without the book constantly *before* their eyes. All defects in the results may be traced, directly or indirectly, to that one defect mentioned above—the lack of properly prepared teachers.

"Among the various plans for obviating a frequent change of text-books, the one of furnishing the books to the children at the expense of the district seems the most feasible and reasonable. It has been tried in the Boston schools with excellent results, and any one desirous of informing himself on the subject may read the Boston School Report. I do not consider the question of sufficient importance to make any suggestions further than what I have said above. In fact this question, like so many others, will be solved by provisions for the better qualification of teachers and in no other way."

High school attendance increased through free text-books.—The committee on accounts of the Boston school committee report as follows: "The free text-book act has undoubtedly been a large factor in filling up our high schools and the upper classes of the grammar schools, on account of the expense saved to parents by relieving them from the purchase of text-books, which, in these grades, requires quite a large sum.

"This increase in the upper grades not only adds to the cost to the city for books, which is a minor expense, but adds considerably to the cost for instruction, as the teachers thus employed generally receive the larger salaries.

"Two of the advantages thus far developed by the use of free text-books, are, first, *avoiding delay* in getting the schools into working order, and, second, in *prolonging* the school life of children."

Progress made in the introduction of free text-books.—Notwithstanding the almost absolute unanimity of the testimony in favor of the free text-book system wherever it has been tried, it has been adopted as yet only to a very limited extent. It is surely making its way, however, and as it appears to be one of those reforms that never move backward, its general adoption can only be a matter of time.

The following table gives a brief summary of the extent to which the free text-book system has been introduced into the different States and Territories, as reported to this Office:

North Atlantic Division—

MAINE.—In about 8 per cent. of the towns.

NEW HAMPSHIRE.—One city and two or three towns have adopted the free text-book law; the law will probably be made compulsory.

VERMONT.—Text-books for the study of "scientific temperance" are free to all pupils; no others.

MASSACHUSETTS.—All towns are required to purchase text-books and loan them to pupils free of charge.

RHODE ISLAND.—Two towns have adopted the plan.

CONNECTICUT.—Three towns have adopted the free text-book system.

NEW YORK.—Very slightly.

PENNSYLVANIA.—Boards have the power to purchase books. They do so in some places but it is by no means general.

South Atlantic Division—

DELAWARE.—In New Castle County.

MARYLAND.—Books free in Baltimore City. Indigent pupils (so-called) free in the counties.

DISTRICT OF COLUMBIA.—We furnish text-books to indigent pupils.

VIRGINIA.—Text-books are furnished free to pupils whose parents or guardians are by reason of their poverty unable to provide books.

NORTH CAROLINA.—No free text-books—children buy and own the books used.

SOUTH CAROLINA.—Not at all.

FLORIDA.—Three well-known citizens certifying that parents are unable to purchase books, the board will supply them.

South Central Division—

KENTUCKY.—Allowance for each county by county judge, for indigent children, not exceeding \$100 in any one year.

ALABAMA.—None.

TEXAS.—To no extent.

ARKANSAS.—No extent.

North Central Division—

OHIO.—None, except that boards of education may purchase books for indigent pupils.

INDIANA.—Under the Indiana statute a few boards of trustees supply free text-books.

North Central Division—Continued.

ILLINOIS.—Boards of directors have authority to purchase text-books for indigent pupils only.

MICHIGAN.—One city in the State uses the system.

MINNESOTA.—One or two districts.

IOWA.—No text-book law, but strong probability of immediate action.

MISSOURI.—The system does not prevail except in the city of Saint Louis.

DAKOTA.—No free text-books are furnished. Law permits school boards to furnish needy pupils.

NEBRASKA.—Four hundred and forty districts out of 5,218 have the free text-book system.

KANSAS.—Not authorized by law.

Western Division—

MONTANA.—Universally.

COLORADO.—It is allowed by law, but has not been adopted to any considerable extent.

ARIZONA.—Is not in use.

NEVADA.—Each school district is authorized to supply free text-books only to children whose parents are too poor to purchase them.

IDAHO.—Indigent pupils are furnished text-books by the district boards of trustees, but application for such aid is seldom made.

OREGON.—The free text-book system does not prevail in this State.

CALIFORNIA.—To indigent pupils only.

ALASKA.—All books furnished by the Government.

CHAPTER V.

CITY SCHOOL SYSTEMS.

Satisfactory progress of public education in cities—Discussion concerning the readjustment of the salaries of assistant teachers—The advantages to be derived from the general employment of men as principals demonstrated by the superintendents of the schools of Macon, Ga., and Pawtucket, R. I.—The importance of school savings banks in teaching children habits of economy—Lack of systematic physical training in the schools, and the need therefor—Gradual abandonment of harsh methods of discipline—Arguments for and against half-day sessions—The division of classes for purposes of recitation and study—Recess or no recess—Causes and remedies suggested for truancy—The proper attitude to be assumed toward tardiness—Experiences of various cities in their efforts to secure habitual promptness—The effect of a new building upon a Baltimore school—Results of examinations of the eyes of the school children of Memphis, Tenn., Columbus, Ohio, and Kansas City, Mo.—The popularity of supplementary reading, and testimony as to its value—The study of music in the schools—The simplification of arithmetic—Civics, and other studies—The opposition to written examinations, and experiments in the promotion of classes without their use—The combination plan frequently adopted—Other methods of promotion—Unpromising reports concerning evening schools in certain cities, and statements from other cities in which their condition is more encouraging—Summaries of city reports, arranged alphabetically—Explanation of the table of comparative statistics, and remarks upon the same—Table of comparative statistics of city public school systems—The difficulties experienced in preparing tables of summaries—Comments upon the table presented—The cities of various States compared—Summary, by States and geographical divisions, of comparative statistics of cities—Summary of same by classes, according to population, with observations thereupon—Remarks relating to the table of absolute statistics—Table of statistics of public school systems of 518 cities and towns, in four parts—List of 162 cities and towns from which no returns were received—List of 10 cities from which statistics unavailable for use were forwarded.

PROGRESS OF PUBLIC EDUCATION IN CITIES.

A review of the work accomplished by the organized systems of schools in our cities during the period covered by this Report, must afford real cause for gratification. That substantial progress and permanent improvement have been made is apparent. More effective organization, better buildings, the employment of larger numbers of trained and experienced teachers, more rational methods of instruction, greater enrolment and more regular attendance on the part of the pupils, are among the phrases which occur most frequently in the reports forwarded to this Office. Nor do these encouraging reports come from a single State or section. New England continues to manifest the zeal in the common schools that has so long distinguished that section, but the reports for the year indicate that in the interest shown by the people and in the manner in which they sustain the schools, New England maintains but scant supremacy over other sections. In the newer cities of the West, and in the impoverished States of the South, where there was perhaps the greatest need for improvement, have appeared signs of marked progress and commendable interest in school affairs. The increased number of Southern cities represented in the statistical tables, and the number of new systems mentioned in the verbal summaries, possess a significance that can not be mistaken.

The popular appreciation of the schools can not be better illustrated than by the difficulty everywhere felt in providing new accommodations as fast as they are needed by the constantly growing schools. The cities in which the number of sittings is sufficient for all the requirements of the schools are rare; yet the cities that do not greatly extend their school facilities every year are much more so.

In the pages immediately following may be found the opinions of experienced educators upon many questions relating primarily to education in cities that have attracted the attention of the school world, with brief descriptions of the status of various improvements suggested or undertaken.

SALARIES OF PRIMARY TEACHERS.

"The impression has been somewhat prevalent in the past, that the candidate for the teacher's vocation who has not the experience or attainments requisite for a position in grammar school grades, can be tried in the primary schools. This impression is decidedly wrong. The person who has not the literary attainments sufficient for a grammar school, is not qualified to occupy the teacher's desk of a school of any grade; and

certainly no position demands special preparation, peculiar tact, and the ability and fitness which come from successful experience, more than that of the primary teacher.

"The trite saying, 'the teacher makes the school' is so readily understood that its truth needs no special argument to prove it. But its truth applies nowhere with so much force as in the primary grades. The primary teacher, more than any other, must draw from her own resources to awaken and keep alive an interest in the minds of the children who are yet incapable of prolonged study from the text-books, and have not acquired the power of independent, patient investigation.

"The fact also has come to be recognized that our primary schools are really the foundation of our educational structure. In them are commenced the formation of those habits which, gaining strength during the various stages of intellectual, moral, and physical growth, influence thought and action during the whole course of subsequent school training. Nor is this all. As 'first impressions are the most lasting,' so the habits thus early formed will not only affect the entire course of training to be acquired in the schools, but also will characterize, in a large measure, the person of mature years.

"The impression to which I have referred gave rise to the practice—which still prevails in connection with your schools—of grading the salaries according to consecutive stages in the classification of the schools, assigning the minimum salary to the teachers in the primary grades. This practice has the tendency on the one hand, to cause the work in primary schools to be regarded as an inferior order of service, from which the teachers gain promotion when they succeed in obtaining a transfer to the grammar grades. On the other hand, its influence is to discourage the competent and faithful whose increased and superior ability and skill in their chosen line of work, have been shown by the sure test of experience; or else, perhaps, its effect is to lead them to accept similar positions in other localities where better remuneration is given for the effective work which they have become able to accomplish.

"The principle of grading the salaries with reference to qualifications and experience is right; but when the promotions to higher grades of salary are on the ground of successful experience they should be made for the double purpose of encouraging the teachers to aim at progressive efficiency, and of inducing those who have achieved a success to continue their service in our schools, in the very kind of work in which they have become adepts. A gradation of salaries on this principle need not involve great additional expense; because, while the salaries for the experienced primary teachers would be considerably larger than now paid, those for the inexperienced would be less." [From the report of Superintendent W. W. Waterman, Clinton, Mass.]

The force of arguments similar to those set forth above is generally recognized, and several cities have already recast their scheme of salaries in accordance with the plan which Mr. Waterman recommends for adoption in Clinton. The school directors of Portland, Oregon, say: "Our experience has demonstrated that we are obliged to pay our eighth or primary grade teachers a higher salary than some of the more advanced grades. The reason of this is obvious; it requires greater experience to handle and properly teach children of six years than to teach those a little older."

At Chelsea, Mass.: "The scale of salaries received a new adjustment and adoption by the board to take effect in September (at the beginning of the school year), by which the majority of assistant teachers now receive an increase of \$50 per annum. Instead of maintaining longer a distinction in the salaries paid in the higher grades, it was thought that the duties and responsibilities of all were equal, and should receive like compensation, the high school and special teachers excepted."

In summing up the recent improvements made in the Philadelphia schools, the president of the board of education uses these words: "The compensation of teachers was so modified as to lessen the distinction formerly existing among the assistants, caused by the wide differences in their salaries. The tendency has been towards an equalization of salary, and therefore in the direction of equal rank and honor. The plan of increasing the salary upon the basis of the term of service has become thoroughly established, and has yielded many excellent results."

A difference yet remains, however, in the salaries of the teachers between the lower grades and those in the higher. President Steel further says: "I trust that at the earliest opportunity this discrimination against primary and secondary teachers may be removed. The board will pardon me for reiterating my conviction that it is the duty of this board to equalize the compensation of assistants in every department of the schools. We shall never be able to get the kind of service that is needed in the lower schools until the salaries are made the same as those in the higher. No one can blame capable and ambitious teachers, employed in primary and secondary schools, for seeking promotion to the grammar schools. The higher salary paid in the latter is the just reward for the better service which they are able to render; and the constant drain upon the primary schools must go on until a position in them is made equal in rank and salary to one in the higher department. I believe that culture, training, and experience are needed quite as much in the primary as in the grammar school; but

we shall fail to secure these qualities in the latter until the pay is made the same as in the former. Make the salaries of all grades of teachers alike; and teachers will then seek employment where they feel they can do the best and most satisfactory work, regardless of other considerations. The rules of this board require the same acquirements for primary teachers as for grammar school teachers. Taken all in all, no one can fairly say that the work required differs essentially as to difficulty or amount in any of the departments; and there is no just reason why the position of a teacher in a primary school should not be equal in honor and profit to that in any other department of the public school system. No duty of the board seems to me more imperative than this, and I trust that some action upon this important matter may be taken at an early day."

WOMEN AS PRINCIPALS.

In August, 1886, the board of education of Columbus, Ohio, resolved that thereafter in case of a vacancy in the principalship of a building of twelve or more rooms, a man be employed. Since women had previously filled these positions, this action was an innovation of considerable importance, and provoked a great deal of discussion. Three such vacancies have occurred since the passage of the resolution, and in accordance with the determination of the board, men have been selected to fill them.

For a number of years only lady teachers have been employed in the schools of Macon, Ga. The superintendent says: "Five years of close observation and a careful comparison, as opportunity offered, of the work done by these ladies with that done in similar grades of public schools in other cities, have not made me feel that in the matter of instruction our pupils lost anything by the substitution of ladies for men in the highest grade of our grammar schools. * * * But in the general administration of these schools the directing hand and the personal presence of a man are also absolutely necessary." He therefore asks for "the appointment of a man whose duty it shall be to supervise these schools and make himself felt in every room and class."

Mr. Alvin F. Pease, superintendent of the Pawtucket, R. I., schools, believes in the superiority of male principals, for these reasons:

"They have usually more executive ability than women. They have a larger acquaintance with practical business and a better knowledge of 'the world.' * * * Besides, it usually occurs that boys of 13 to 15 years of age need the strong influence and restraining power of a man; and where that influence is felt, the occasion for special discipline is largely removed. In some of our best grammar schools it frequently happens that there is no necessity for the infliction of punishment for weeks or even terms at a time; and the same influence over the larger pupils extends to the other rooms of the building, so that a majority of the cases of insubordination and serious difficulty occur in smaller buildings where there is no male principal."

SCHOOL SAVINGS-BANKS.

"The importance of teaching children to save, not so much for the amounts hoarded as for the educational value of the weekly lesson, has for many years been recognized with more or less earnestness by the managers of charitable and mission schools. In most of our cities various simple and practical methods have been used, in connection with voluntary school work to help the waifs of our population to acquire habits of thrift; but it is a rather curious fact that the first public school (Third Ward Grammar School of Long Island City, N. Y.) in the United States to adopt as part of its weekly drill the savings-bank plan only did so in 1885, and that during 1886 but six other public schools followed suit. Now, however, many school boards are moving in that direction, and there seems no reason to doubt that during this year more than one hundred schools will have introduced the plan into their curriculum.

"Such an absolutely new departure in the education of American children must interest all mothers, and it behooves them clearly to understand what school banks are, the drift of their teaching, and its effect on character.

"Fortunately school banks are no experiment, although a novel addition to the public school system of the United States; therefore those who advocate their general adoption in this country can support the demand by pointing to the experience of a great nation, France. The economic training of the French people was proved to the admiration of the civilized world in 1870, after the Franco-Prussian War, when the war indemnity was subscribed several times over, mainly by the *bourgeoisie* and peasantry, and this stupendous act of patriotic thrift, M. Gambetta said, was largely due to the industrious and saving character of the French women; therefore any national teaching in economy adopted by France must claim our serious investigation.

"Until this year no special book or treatise on school savings-banks was published in English, and except in government reports little information was available in any

language; but Miss Agnes Lambert, of London, has just published a small *School Bank Manual*, and Mr. J. H. Thiry, of Long Island City, has issued a *History of the Penny School Savings-Banks of the Public Schools of Long Island City, N. Y.* Timely as such directions are for educators and school boards, reports and pamphlets do not tempt the general reader, who is almost always a busy, often tired, man or woman; so we propose for the benefit of all those interested in children, to state briefly what school banks are, and why they are valuable helps to national education.

"The *modus operandi* of a school bank is as follows: Having arranged with some savings-bank to receive deposits, the principal of a school gives notice to the several classes that every Monday morning their teacher when calling the roll, will receive their small savings (from 1 cent up to 50 cents). On making the first deposit, a pupil is given a card with his or her name, date, and amount deposited, receipted by the teacher; this card the pupil keeps, presenting it every time a deposit is made, the card having dates for the whole school year.

"After the first few collections, when, like any other new drill, children are awkward, fifteen minutes is sufficient to receive the savings of a class of 50.' The teacher appoints some bright pupil 'collector,' who takes the card and money from each child and hands it to the teacher, who counts the money, receipts the card, and returns it to the scholar. The ordinary roll-book serves as a record book. For instance, a name is called—'Jane Smith.' She makes answer, 'Three cents,' and three cents is entered in the savings column opposite Jane Smith's name. If nothing has been saved, a cross so indicates, and merely 'attendæ nec' is marked. The principal, who is the *de facto* treasurer, requires a special book for names of depositors and amounts saved, as the savings of all classes are handed to him, and he sends them each day to the savings-bank, getting a receipt for the whole amount. When a pupil has saved 25 cents (or any other sum agreed on) he is given a bank-book, and becomes a regular contributor—although interest is rarely paid on very small sums—and until he receives a book his name does not go on the journal of the savings-bank, but his savings are kept to the credit of the principal in what is called a 'general fund.' These pupil bank-books, kept by the principal, are sent to the bank monthly to be balanced. They can be taken home at regular dates to be shown to parents; and during vacation, or when a pupil leaves, he receives his book. Money can be drawn out at any time with the consent of parents or guardians, by procuring the principal's signature. After leaving school permanently a scholar can still continue to use the school bank-book for other savings.

"This simple plan, unsuccessful operation in several American schools, differs slightly in some of its details from that used in Europe; but it has been carefully worked out to suit our own school system, can be modified by any intelligent set of teachers or school directors to meet local views and needs, and fulfils the essential requisite of a school bank—that it should form part of the school course.

"On January 1, 1887, 7 schools in the United States had 'adopted' school savings-banks, 6 of these being in or near Long Island City, and 1 in McCook, Nebr. What had they added to their curriculum? Strictly an *object lesson* in thrift, industry, self-denial—a practical lesson which, without pushing any theoretical instruction out of its way, can do more to undermine the dangerous communistic spirit of the age than any amount of mere book learning.

"A woman is principal of the first American school with a school bank, and out of 450 scholars 403 are depositors, having saved from March, 1885, to January, 1887, \$2,382; of this amount \$602 was withdrawn for use, and \$1,780 remained 'due depositors,' an average of \$4.16 per child.

"Before passing to our second point—the educational value of school banks—a few facts in connection with their encouragement and growth in Europe may meet and answer in advance objections which will occur to many to whom the question of juvenile thrift is new and objectionable.

"France, the only country with a national system of school banks, between 1874 and 1886 established 24,000 of these banks, with nearly half a million of depositors, whose savings aggregated a trifle less than 12,000,000 francs, or about \$2,400,000.

"Spurred by this marvelous example, the educators of other nations turned their attention to school banks. Italy has 3,456, Hungary 700, and various Belgian cities have adopted them with success. Great Britain, with 19,000 elementary schools, teaching 4,000,000 children, has only 2,000 school banks, but their unprecedented success in towns like Liverpool, Birmingham, and Manchester shows that where school boards and teachers understand the matter their growth is certain. In 1885 the Board schools of Liverpool had 74 banks, numbering 10,000 depositors, who that year deposited \$20,000, drew out \$15,000, and left \$5,000 in the Liverpool Savings-Bank. In that same year English educators showed their estimate of school banks in a circular for instruction of the Education Department, addressed to school inspectors, where it was expressly stated that where circumstances permit, a school must have a savings-bank if it desires the aid granted to schools that are reported as "excellent."

"It has been well said that school banks are to the lesson in thrift what pen, ink, and paper are to the lesson in writing, and although much abuse has been heaped on our over-education of the masses, few would seriously curtail the facility with which every child born on American soil can learn to read and write. When the equal value of the other lesson is understood, we will be no less reluctant to deprive our children, the men and women who are to complete any good works begun by us, of instruction in that high human office, economy, said by Emerson to be 'a sacrament when its aim is grand.'" [Catherine Baldwin in Harper's Bazar.]

To this it may only be well to add the following, from the report of the superintendent of the Rutland, Vt., schools for 1886-87: "The savings-bank feature continues to operate satisfactorily, the total average deposit being about \$75 per month. There are now 453 accounts among the scholars and an aggregate deposit of \$1,323.26."

PHYSICAL TRAINING.

This subject has not yet been accorded the attention it deserves. In a few instances gymnasiums have been provided for the students of high schools, but beyond the general calisthenic exercises that obtain in some localities, no provision has been made by any city for the systematic training of pupils of the elementary grades. An occasional recommendation or reference to the matter by some superintendent or school committee is the only evidence that the necessity of such training in the schools is felt. The following extracts are taken from recent reports:

"Too many principals and teachers mistake for physical culture the performance of a few dilatory movements once or twice a day. * * * Beyond all other things, attention should be paid: first, to the *preservation* of the functions, afterward to their development; yet the unnatural focus, the cramped hand, folded arms, and contracted chest are not hard to find, though they have no place in the economy of nature and certainly not in the school room. After these have been carefully remedied, it is time enough to think of training the eye, the hand, and the ear, to expand the chest, and to strengthen the back muscles; but to attempt to undo in five minutes the harm that has been done in five hours is manifestly useless. Above all considerations develop a sound *body*, if possible, and then a sound mind, and '*mens sana in corpore sano*' will be no longer a mere formula." [From the report of the superintendent of schools, New York City.]

"In any system of education worthy of the name, physical culture must be a prominent factor. Muscle needs to be developed as well as brain. Indeed, mental power is, to a great extent, dependent upon a robust physical development. To cultivate one to the exclusion of the other is to disjoin things which the Creator never intended to be separated. * * *

"It is too much to expect that our regular teachers, who have had no special instruction in this subject, will be able to lay out and pursue a well arranged course of instruction in physical culture for the children in their schools. It needs an expert, a specialist, one who has had a thorough drill in physical movements and who can direct the kind of exercises to which children should be subjected from the time they enter the primary school till they are graduated from the high school." [Superintendent Wm. Connell, Fall River, Mass.]

"As the games are to the kindergarten course so ought calisthenics to be to the district school, namely, a timely alternation to physical training from mental application, which in the young may easily be pushed beyond the limits of unflagging interest. Not only ought this exercise to be given a regular place on the programme of every school, but its occasional omission from the actual work of the day ought not to be excused except for very good and sufficient cause." [Report of Board of Public Schools, Saint Louis, Mo.]

The pupils of the Rochester, N. Y., Academy three years ago obtained the permission of the board of education to fit up an unused chapel as a gymnasium. An advantageous arrangement was made by which the services of an instructor were secured without cost, and thus the benefits of physical culture were obtained almost without effort on the part of the board.

It appears that the instruction has been extended in a measure to the children of the lower grades, since a late report states that "physical exercises are carried more or less into every grade of our schools. * * * The exercises are varied in the upper grades, both with dumb-bells and swinging clubs. The competition in the several schools is great, and each school is trying to excel the other. The result of this training is such that the muscles are greatly strengthened, the body better developed, the mind increased in capacity, giving the whole system a tone of healthfulness heretofore almost unknown among school children."

The question of introducing general systematic instruction in gymnastics in the schools

of Cleveland, Ohio, is thus discussed by the president of the board of education in his report for 1885-86:

"The object of educational training is the general preparation for life. Man possesses a dual nature, soul and body; general and harmonious education therefore must embrace the body as well, and demands of the educator the furtherance of physical development and culture. In practical life a strong and well trained body is indispensable; labor and effort are abortive, when the spirit has not a storm proof physical instrument—when the shock that smites the spirit also prostrates the body. General culture and practical fitness for life both require gymnastic training, and therefore gymnastics have a just claim to our recognition in our system of public education."

CORPORAL PUNISHMENT.

"The most important change, which these later years have brought, has been the coming in of more sympathetic relations between teacher and pupil; in less show of authority and more real power; in letting down the formal barriers of restraint, and letting in a sweeter and truer control; in bringing the teacher's platform nearer the pupil's desk, and the teacher herself closer the pupil's mind and heart. In furnishing a mellow light and a purer air for the school room the teacher has fully kept pace with the architect." [Superintendent George Howland, Chicago.]

"One of the most important steps taken by the board of education—a step taken, as I believe, in good faith and in the interest of humanity—has been the permanent abolition of corporal punishment in the schools of our city. The resolution passed to this effect by the board was a general surprise to the faculty of teachers as well as to the citizens of Cleveland. There have been not wanting warning voices in the public prints and among the people condemning the action of the board as premature, inconsiderate, and even demagogical. It is a matter of special pleasure and satisfaction to me to inform you that the discipline of the classes has not suffered through the abolition of corporal punishment. The question whether it will ever again be desirable may safely and calmly be submitted to posterity." [President E. A. Schellentrager, of the Cleveland, Ohio, school board.]

"The by-law prohibiting corporal punishment of any kind is still an essential part of the system of discipline. The severest punishment that may be inflicted is suspension or expulsion, and the efficiency of the system is clearly apparent in the constant diminution of the number of these suspensions." [Report of New York City school board.]

"The abolishment of corporal punishment has not added to the number of mischievous or backward pupils. The unlimited use of the rod is certainly not desirable. It may be, however, that its use under some restrictions, to be devised by the board may be advisable, for it seems there are mischievous and ill-behaved pupils, who undoubtedly would be benefited by the application of it." [Superintendent John Miller, Newburgh, N. Y.]

"Corporal punishment will be allowed only in exceptional cases, and then it must be inflicted in the presence of the superintendent." [A rule of the Atchison, Kans., board.]

"No corporal punishment is permitted, except by request or consent of parents or guardians. While many object to the use of corporal punishment as a means of discipline in school, I would not recommend its abolition. Cases are likely to arise in any school in which corporal punishment, if applied in the right spirit and in the proper manner, is the best and most effectual means to which a teacher can resort." [Superintendent John Cooper, Leavenworth, Kans.]

"As the State law explicitly forbids the infliction of corporal punishment in schools, suspension or expulsion must be resorted to when moral suasion fails. Cases occasionally arise where it seems as though this prohibition was a mistake, where Solomon's admonition, 'Spare the rod and spoil the child,' should be heeded. However, as long as the present law remains in force, parents should be the responsible parties in the question of 'spoiling the child.' No law forbids their use of the rod." [Mr. A. W. Edson, city superintendent, Jersey City, N. J.]

"Your committee would report that in its opinion the law prohibiting corporal punishment by the principals of our schools has had a bad influence on the pupils; that the ill-disposed scholars take advantage of it, knowing that the greatest punishment that can be meted out to them for their disobedience is either suspension or expulsion, which in many cases is more of a gratification to them than a punishment." [Committee on visitation, Paterson, N. J.]

HALF-DAY SESSIONS.

This plan, originally devised as a temporary expedient to be utilized only in the absence of accommodations sufficient to permit the attendance of all pupils during the

entire day, has been received with high favor in some localities. Mr. D. C. Tillotson says, in his last report as superintendent of schools at Topeka, Kans.: "The first grades have for a number of years been managed on the half-day plan—one set of pupils attending in the forenoon, and another in the afternoon. This saves from eight to ten teachers, saving about \$5,000 per year in running expenses. This saving has put the board on a sound financial basis, and experience shows that the pupils lose nothing in scholarship. A child will do as much mental labor in a half-day as should be required in the twenty-four hours."

The superintendent at Rockville, Ind., reports: "Since our last public announcement we have adopted and tested the half-day system for first year pupils. The plan has proved entirely satisfactory. While it maintains the interest and vigor of the school, it also sustains the scholarship and prepares the grade for promotion upon a record that the all-day plan can not secure. The continuance of the system is especially desired."

After an experience covering a year with half-day sessions in the primary schools, Mr. M. L. Knight, of Beaver Falls, Pa., thus states the disadvantages and advantages of the plan: "I find even in these lower rooms a class of older pupils, who have had but a limited opportunity of attending school, who have made but little advancement, but who are old enough to study. Some are found whose time when not in school is spent on the street, or in company with those whose influence is evil, and whose conduct is demoralizing. A few instances have also been reported where pupils were deeply interested in school when permitted to attend all day, but when in attendance half a day they seemed to lose much of the former interest. In these instances I believe the half-day system has been a disadvantage.

"On the other hand, I have found many advantages, among which I would mention improvement in order, fewer cases of discipline, a much purer and more healthful atmosphere in the school-rooms, and consequently, better health among pupils, only one death occurring in eight months out of an enrollment of over 1,600 pupils. I found also a more intimate acquaintance and personal knowledge of the disposition and ability of pupils by the teacher, greater confidence and less restraint on the part of pupils, thus transforming the rigid government so often found in the school-room into the more perfect freedom of the kindergarten or the family.

"I have endeavored to take an unbiased view of this system, and to formulate a report based upon facts. While I am not able from our brief trial of the system, to recommend the plan for permanent adoption in all of the rooms in which it has been tried, I will say, however, without hesitation, that for children the first year in school, whether few or many are in the room, I am satisfied that three hours' drill each day, such as is given in our first primary rooms, is long enough. Pupils of this age can not study, hence they learn only while being taught, and if they can receive the same attention and instruction in three hours that they otherwise would receive in six, I can see no advantage to be gained by the long period of confinement. The school-room is not a nursery, but a place to receive and impart instruction.

"What has been said respecting pupils in school the first year is to a great extent true of children of the second or even the third year in school, and yet the exceptions heretofore referred to leave it an open question. If permission were given, and suitable provision made whereby those who desire the privilege and would be benefited thereby could attend both morning and afternoon sessions, I believe it would meet with favor and be open to but few objections."

Superintendent W. B. Powell, of Washington, D. C., looks with little favor on the plan which allows the pupils' attendance but half the school day, and devotes a considerable part of his report to the subject. He says: "A half day at school is enough for a first or second grade pupil, if the school is not well taught or is in an unhealthful, uncomfortable, or uninviting school-room. These conditions, however, ought not to exist. The school-room should be commodious, well lighted and well ventilated, clean and wholesome, and not overcrowded. Our teachers are competent to teach well, and where opportunity is given do teach well. * * * The greater part of the moral effect of school life is lost to the child by the half-day school. Time is an important element in good teaching, particularly in the primary grades, as it is a necessary element in the acquisition of knowledge and in the assimilation of thought. If knowledge is to be gained by effort, and its value proved by experiment and application before it can become a source of power to its possessor, teaching that is wholly didactic has but little in it that is purely educational. Yet the teacher who has 50 or 60 pupils to instruct in three short hours, shortened by the encroaching darkness of a winter day, can do little or nothing in the way of training. The primary pupil of six or seven years, who is learning to see, who is taking his first steps in language, cannot be properly taught didactically. He learns to see, to talk, to read, to write, by seeing, talking, reading, writing; he learns numbers only by handling numbers of things; he learns forms by making and comparing forms; and he learns to represent forms by much practice in representation. The child himself must do.

"The teacher's office is to direct, to guide; and as the young learner is teaching himself by self-activity, requiring much time, the exercises must be changed frequently, that he may have proper recreation, and this also requires much time. The child's school hours should be spent in doing or in activity for specific mental improvement, alternated by doing or physical activity for recreation, enjoyment, or specific physical improvement. This takes time. If the teacher has not the time to do this work right, she will dictate the scholastic part of the work and the child will suffer by loss of both mental self-activity and the physical activity. The primary schools should take the child as they find him coming from the home, with all the perceptive faculties active, contributing to enjoyment and adding to knowledge, and should seek to teach him by the continued activity of these same faculties systematically directed for specific purposes, and should not so radically change the child's life as to make his school life a mere memory drill. But the short-time school converts the teaching into almost purely *memoriter* work.

"Manual training begins in the kindergarten and should be continued in the primary school, but the child in the half-day school has no time to draw, to make forms of clay, or, by folding and cutting paper, or by laying sticks or other means; has no time to represent forms. His time must be spent in committing to memory that which he may or may not understand, because the scholastic grade work must be done.

* * * * *

"That healthy, mental, moral, and physical growth that can come to childhood only by wisely directed, systematic, pleasing, and conscious self-activity can not be realized in a half-day school. That pure, natural, and earnest love for truth and knowledge is never known by the child who receives without question or investigation doses of facts as from the hands of one who has diagnosed and prescribed without explanation. Most of our teachers can do the legitimate work of the primary school properly, but they complain that the half-day school does not afford the time for doing it, and their complaint is well founded. Little time is allowed for calisthenic exercises, for games, for songs, and the repetition of mottoes; but all effort must be directed to accomplishing the grade work, that can be done only by continued pouring in, and a nervous, hurried, and too often meaningless memory drill. No one knows this better than the conscientious teacher, and no one speaks of it more frequently or more feelingly. That such *memoriter* work can be found in the schools is too true. That such work is found in the schools is not the fault of the teacher who is forced to do work on the half-time allotment. If we would have more and better training in school, and fewer home lessons to be studied by our small children, we must give more time and better opportunity to do the work.

"Six hours may be too long for the youngest child to go to school, but four hours—two in the forenoon and two in the afternoon, or five hours—two and a half in the forenoon and two and a half in the afternoon, for the child to be alternately working and playing, improving and resting, developing mentally and developing physically, by turn, are none too many. The child is better off in such a school than at play."

DIVISION OF CLASSES.

The following rule prevails in the schools of Washington, D. C.: "They [the teachers] shall divide their schools, when all pupils are of one grade, into two sections, and shall have one section studying while the other is reciting, as far as practicable. In penmanship, drawing, vocal music, and a few general exercises and explanations, the school should be instructed as a whole."

This arrangement is in use in a number of cities. In many cities of smaller size in which semi-annual promotions are the rule, it has been necessary to assign two classes of different grade to each teacher for the sake of economy, and in nearly every case of this kind the results have shown not only that the financial interests of the city have been advanced, but that the quality of the instruction has actually been improved.

At Steubenville, Ohio, "this has been the plan followed for the past seven years, and it is believed to be better than having all pupils in one class."

Mr. H. M. Maxson, of Attleborough, Mass., suggests that "in the arrangement of classes it would be an improvement to give each teacher 40 pupils of two nearly equal grades, rather than 40 pupils of one grade. Nearly all the recitation work in a school of one grade should be done in two divisions; thus the number of recitations with one grade in a room is about the same as it would be with a like number of pupils in two grades. The higher grade would suffer no loss in consequence of each teacher having two grades, while many of the lower grade would gain much by what they heard of the recitation of the higher grade. There would also be a greater variety of work for the teacher, and no necessity for teaching the same thing twice each day, with the loss of interest which necessarily follows from such repetition."

Mr. Joseph O'Connor, deputy superintendent of San Francisco common schools, thinks that, "the elasticity would be increased and the time and money saving made

greater if each class were arranged to consist of two consecutive grades; for then, without at all disturbing the general order and classification, the teacher might at any time promote deserving pupils from the lower to the higher division of the class."

This gentleman quotes, in further support of his proposition, a letter from the principal of the Vallejo (California) High School, as follows: "For three years past the grammar schools of Vallejo have been arranged with two grades in each room. The teachers have all had experience of years with one grade in a room, and now three years' experience with two grades in each room, and all prefer having two grades in each room; not one would willingly change to the one-grade arrangement."

The following method of division reported from Decatur, Ind., also finds supporters: "The four grades of the primary department and the first two grades of the grammar department are each divided into two classes. The work of the two classes is the same, the only difference being the thoroughness with which the work is done. Pupils are transferred by the teacher from one class to another at any time on merit. By this means no pupil is held back on account of a dull class, but is permitted to go on as soon as he is ready. While this is no detriment to the indolent, it is of great advantage to the industrious."

RECESS OR NO RECESS.

The recess question continues to be one concerning which men wise in school affairs disagree. The year has brought forth nothing new or important in the way of argument, for the main points in the discussion had been frequently elaborated in past years. It may be well, however, to add the results of another year's experience to the supply of testimony pro and con, that has accumulated.

Mr. A. P. Marble, rejoicing that the schools under his supervision in Worcester, Mass., did not discard the recess plan, says: "We may congratulate ourselves that we were left behind in this instance by the so-called car of 'progress.' The progress is the wrong way."

The Mankato, Minn., superintendent does not believe in "no recess," and in the schools of that city the recess time in inclement weather is profitably employed by the teachers in teaching the girls to knit and crochet.

The Danvers, Mass., school committee explain that an intermission in the school work at noon is better suited to the habits of the majority of the people of that town, and is for that reason, preferable, even if no other were urged.

In New York City there are 2 sessions of 3 hours each, daily.

In behalf of "no-recess" is the following from Albany, N. Y.: "The fifth year of the no-recess system has corroborated the evidence of previous years, that, as promotive of healthfulness and moral and intellectual progress, it is a great step in advance over the old-fashioned mid-session recess."

The esteem in which the system is held in Muscatine, Iowa, is shown by this utterance from the principal of one of the ward schools: "Another benefit from the no-recess plan is a fuller and more regular attendance in the higher grades. It gives more time for necessary 'chores' at home by shortening the school sessions, and hence more time to attend the regular school sessions."

From Attleborough, Mass.: "For a year and a half the schools have followed the no-recess plan. Last year and also this I made inquiries of teachers as to its results. The universal testimony is that it is satisfactory to the teachers, and also to the parents, as far as their opinion is known. The only thing approaching complaint in this connection has been concerning excuses to leave the room, and the co-operation of parents with teachers will easily remove this."

TRUANCY.

In the requirements for an efficient system of schools the importance of regular attendance on the part of the pupils comes next to the necessity of securing competent teachers. There must always be unavoidable reasons which necessitate the occasional absence of a child from school. The occurrence of such reasons is recognized as unfortunate but necessary, and does not, therefore, cause concern. Save in exceptional cases, as during the general prevalence of disease, the proportion of absences from such causes to the total membership is practically uniform in all cities. It is not this proportion, but the number of absences for which there is no legitimate excuse that school managers everywhere exert themselves to reduce. The aversion of some children to the schools, and the indifference of their parents, are supposed to be the most common causes for needless absences.

In those States where attendance is required by law the employment of special officers to seek out absentees and bring them into the schools, has become quite common. That plan has usually yielded excellent results in the cities. Such an officer being brought in con-

tact with children who yield reluctant obedience to the law may be expected to discover facts which would not ordinarily be known to the teachers, and to recommend remedies that would not suggest themselves to those whose acquaintance with truants is limited to the intercourse of the school room.

There can be little doubt that the following from the report of the truant officer at Haverhill, Mass., might be said of the majority of cities:

"In almost every instance the boys who give me the most trouble are those who have the least care at home, both as regards their moral training and personal appearance. Some of the worst cases I have to contend with are those who are obliged to attend school with clothing so indecent as to make them ashamed to mingle with their well-clad associates. There are some parents who utterly refuse to send their children to school, not being able to clothe them respectably, and there are as many pupils out of school from that cause as from any other."

The superintendent at Williamsport, Pa., is inclined to throw much of the blame for truancy upon the parents of the delinquent, and states that they are often "willing to cover the fault of the child by lying to shield him from merited punishment."

At Hartford, Conn., the question of absence and excuses had grown to such importance that the board took decisive action upon the subject during the year in the form of a vote "that no excuse be granted by the acting school visitor, excusing any pupil from attendance at the whole or any part of the regular session of any school in this town, or from any of the regular exercises of such school, except upon the certificate of a reputable physician that such excuse is required by the state of such pupil's health."

PUNCTUALITY.

Closely related to the question of school attendance is that of promptness. Upon this subject Mr. Henry N. Mertz, superintendent of the Steubenville, Ohio, schools, thus sensibly expresses his views:

"As regards tardiness there is a golden mean that the teacher should strive to maintain. The evil effects both on the school and in the formation of the habits of the child are recognized by all, and no reasonable effort should be spared to prevent all unnecessary tardiness; but the fact should be recognized also, that sometimes the child or his parent has to choose between tardiness and absence. There may arise some combination of circumstances which make it impossible for the child to be at school on time. Now, tardiness may be made so odious by the teacher, and absence be so lightly passed over, that both parents and children prefer absence, and the child who might have been in school all the half-day except the first five minutes, stays away and misses the half-day's instruction rather than be numbered with the tardy troop. After considering the effect of the interruption caused by a pupil coming in late, the moral effect upon the school, and the influence in forming the character of the pupil himself, we believe there is still a balance in favor of having the pupil come to school as soon as he can. No teacher should make tardiness so much greater offence than absence that children will prefer the latter."

Crawfordsville, Ind., a city of 7,473 inhabitants, with a school enrolment of 1,293 and an average attendance of 995, is the only city in the country that has secured entire immunity from tardiness during the year. The superintendent says: "The publication of the yearly catalogue with its faithful record of the attendance and punctuality of every pupil has had much to do toward putting our schools in the enviable position they occupy with respect to punctuality, as has also the kindness of the local newspapers in publishing our monthly roll of honor."

Another city in the same State, Warsaw, reports only 85 cases of tardiness, but 13,252 half-day absences. The superintendent states that, "with the high sentiment against tardies, quite a number, when they find themselves tardy, return home and come in with a quarter or a half day's absence, thus increasing the evil."

The plan of rewarding classes perfect in attendance with a partial holiday has been tried in several cities with excellent effect. Mr. M. L. Hawley, of Gloucester, Mass., reports: "This object is effected by our practice of allowing schools to be dismissed an hour earlier on Fridays for perfect class attendance during the week. This privilege, with the generally admirable work of the teachers, has produced excellent results. Our school attendance is now at high-water mark."

At Chelsea, Mass., "the plan of dismissing one hour earlier at the close of each month all who have been neither absent nor tardy during said month, has undoubtedly had a salutary influence upon the attendance, and if one half-day were the reward instead, for such constancy, it is believed that the actual gain in scholarship and the formation of good character would more than balance the loss occasioned by the extra half-holiday."

The superintendent at Chicopee, Mass., thus bears witness to the efficacy of the plan:

"The per cent. of attendance for the year is 93.4, an increase of 2.8 over that of last year, which is largely due to the adoption of the plan of giving a half-holiday each

month to pupils, in all grades below the high schools, who are neither absent nor tardy. This plan, although in operation less than a half year, has proved to be a wise one, giving us an increased percentage of attendance for each month, and consequently giving teachers opportunity to do more and better work in teaching; for it must be apparent to any one conversant with school attendance that more can be taught in thirty-nine half days with perfect attendance than in forty half days with broken and irregular attendance, which amounted previously in many cases to an absence of from one-eighth to one-half of the entire number of sessions for the month. I would most earnestly recommend the continuance of this plan."

THE EFFECT OF COMFORTABLE ACCOMMODATIONS.

"Commodious, neat, convenient, well lighted and ventilated class-rooms play an important part in promoting the moral, intellectual, and physical usefulness of a school. The school at Locust Point demonstrates the truth of this statement. When the school, numbering about 100 pupils with 3 teachers, was kept in a dingy, cheerless old chapel, near its present location, it was small, difficult to manage, and although the teachers did everything possible to promote the efficiency of the school, yet the pupils were untidy, unpunctual, hard to discipline, and did not make satisfactory progress. After the school was transferred to the new building in which it is at present accommodated, great improvement was immediately apparent—the number of pupils increased from 100 to 333, and the number of teachers from 3 to 8. The neater appearance, better conduct and attendance, greater progress, and the increased efficiency of the school generally, is admitted by all." [From the report of Mr. Henry A. Wise, superintendent of Baltimore, Md., schools.]

EFFECT OF SCHOOL WORK UPON THE EYE-SIGHT.

This subject, in the general discussion of school hygiene, has received its share of attention.

"In the old school-rooms, and we need not go far back for them, the light was often so insufficient, that much harm undoubtedly resulted to the eyes of the children. But in our newer buildings so much thoughtful attention has been given to this subject, that the evil no longer exists there. Pupils, too, have been allowed to study with too little regard to position, and with the object too near the eye; perhaps with the result of myopia in some cases, but by no means, in my judgment, to the extent often charged.

"The oculist is too definite, and too certain in his knowledge. Why should the book or paper always be '15 inches from the eye?' Five feet seven may be the average height of a man, and 8 the right number for his boot; but is he to be considered deformed, or a monstrosity, who is 5 feet 6, or who wears a number 7, or 9?

* * * * *

"Of over 80,000 children in our schools I have never seen one voluntarily take that distance, and have eminent professional opinion that such an enforced rule would work more harm than ever our neglect has done. Nothing will lie so unblushingly as figures.

"Much attention has been given to this subject, and in many of our schools the result is all that good sense, or good science can demand." [From the report of Mr. George Howland, superintendent of Chicago schools.]

The following, from the report of the board of education, describes the results of a recent examination of the eyes of the pupils of two of the leading public schools of Memphis, Tenn.:

"The eyes of 681 pupils have been examined. Of these 588 had perfect sight, 60 had imperfect sight from general causes, and 30 had impaired vision from eye strain. It is interesting to trace the gradual increase of this form of impaired sight (near-sightedness) from the primary classes, where it is hardly noticeable, to the highest grade, where it reaches 15 per cent. In this particular my results are similar to those obtained by examiners in this and other countries. But a point which should not be overlooked is this—that my examinations were confined to pupils in two different school buildings, each of which may be taken as a sample of its class. The Market street building has been recently constructed and is well arranged, both as to illumination and ventilation, whereas the antiquated structure on Linden street is sadly deficient in both of these particulars. Now, compare the percentage of near-sighted children in corresponding classes (fourth, fifth, and sixth) in the two buildings, and you will find that while the Market street school has 2.8 per cent., the Linden street school has 5 per cent. These figures commend the new building as strongly as they condemn the old, and no stronger plea can be advanced for new buildings, so constructed as to furnish proper illumination and a plentiful supply of fresh air than is furnished by these figures, which show that nearly double the number of pupils with impaired sight come from a badly constructed building with poor light and bad air."

In November, 1886, Dr. H. P. Allen, of Columbus, Ohio, was appointed by the board of education of that city to examine the eyes of the pupils of the public schools. In his report he says:

"I examined between December 12, 1886, and June 6, 1887, the eyes of 4,700 pupils of the public schools, as follows: All of the high school classes, 12 in number; all of the grammar schools, 72 in number; all of the primary schools, 24 in number; and 12 of the B, C, and D primary schools, making a total of 120 schools out of the 200 of the city. This included all of the children above 10 years of age, with the exception of about 250, who were scattered through the various lower schools. I visited all of the school buildings and saw most of the school rooms.

"The examinations were made chiefly to determine the condition of vision of the children, and find, in cases where vision was defective, the correcting glasses. The work was done in the school room during school hours. Each child was examined separately, its name, age, sex, nationality, complexion, color of eyes, condition of sight, and required glass noted at the time. * * * My records indicate the kind of trouble and the condition of sight with sufficient accuracy for all practical purposes, and enable us to draw certain well-defined deductions. * * * The points to which I wish especially to call your attention are as follows:

"First. The large number and percentage of pupils among the 4,700 with one or two defective eyes—1,175 cases, or 25 per cent. of all the children examined. * * *

"Second. Those with two defective eyes—936, or 20 per cent. of all the children examined. * * *

"Third. The increase in prevalence of near-sightedness as we go up the scale from 0 per cent. in the D primary schools to 13 per cent. in the senior class of the high school, and 17 per cent. among the females of the senior class from 0 per cent. at the age of 6 years to 11.3 per cent. at the age of 17 years, showing the relation of this trouble to increasing age and increasing demands upon the eyes.

"Fourth. The about equal percentage of each of the other defects in the low, intermediate, and high grades, showing their independence of increasing years and increasing demands upon the eyes.

"Fifth. The diminution in the percentage of good eyes as we ascend the scale, from 80 per cent. in the D primary to 66.6 per cent. in the senior class of the high school."

A similar examination was made during the year of the eyes of pupils in the public schools of Kansas City and Nevada, Mo., and of the students of the State normal schools at Warrensburg and Kirksville, Mo., and the State universities of Missouri and Kansas, by Flavel B. Tiffany, M. D., of Kansas City, Mo. The results of this examination differ in at least one material respect from those reported from Memphis and Columbus. The most important facts developed, with other matters of interest mentioned by the examiner, are here shown:

"That perfect vision, perfect eye-sight, be enjoyed by our progeny depends largely upon the recognition of any defect, slight though it may be, in early life, timely correction of the same if possible, and care and proper use of the organ while in the school room. That many a boy or girl with some anomaly of refraction or accommodation has been allowed to suffer day after day in order to keep pace with his class, and eventually develop more serious conditions or even blindness, is too evident; whereas if the trouble had been recognized in time and proper steps taken much suffering as well as serious consequences could have been averted. The object of these investigations is to ascertain the condition of the eyes of the youth, the effect of use of the organ for near and small objects, and the final consequences; and finally, if possible, to correct the evils arising before irremediable damage has been done.

* * * * *

"In our investigations not only myopia but hypermetropia, astigmatism, spasm of accommodation, and strabismus were looked for. Every eye that was not up to the standard of vision (that of twenty-twentieths) was not dubbed myopic. A careful examination was made with the trial glasses, or optometer, and a more accurate diagnosis made. Our results show a much larger per cent. of hypermetropia and astigmatism and spasm of accommodation than myopia, there being nearly four times as many hypermetropic pupils as myopic. Of the whole number examined, 2,040, in the different grades and schools, 99 or 4.8 per cent. had spasm of accommodation. Now, spasm of accommodation, or simple hypermetropia even, if not corrected by glasses or relieved by rest from near and small objects, is likely to develop into myopia or possibly intraocular disease; hence the importance of these examinations.

"In our examinations the increase of anomaly of refraction as we ascend in the grades is not marked. In fact, in some schools it seems to diminish; but this would not be a definite proof one way or the other, since from one examination, as a different set of pupils are examined in each grade and in each school, there is no means of knowing but that those of the higher grades started with the same degree of anomaly in the primary

departments as is found in the seventh year of the grammar school or the high school. In fact, it seems to be true that pupils with anomalies of refraction, both myopes and hypermetropes, are closer students and fonder of books and study than the emmetropes or those of perfect vision, and hence these students remain in school while many of those with perfect vision drop out before they reach the higher departments. In our examinations we find a greater percentage of anomaly among the normal schools of Kirksville and Warrensburg than any other, but it does not necessarily follow that this is the result of a longer course of study and closer application with the eyes, although it is conjecturally true. The only way to prove that study is the cause, or otherwise, is to watch the same set of pupils from the primary department up through the different grades, and see if John, Mary, and James, starting at 6 or 7 years of age in the primary department with perfect emmetropic eyes finally later on develop myopia. In our examinations this can be done, as we have the name in full, color of each eye, present amount of vision, whether there is any hereditary defect or not; and now, should the examinations be continued and the same pupils called for as they enter the higher grades year after year, a very definite and satisfactory idea can be gained.

"As to the lighting and ventilation of our school-rooms very little need be said, as so much attention has been given to this subject by our efficient board that the Kansas City school room is almost perfection in those particulars. In the Washington School, where we find the largest per cent. of defective eyes in the lower grades, I noticed first and second year pupils, for want of room, were crowded into a room calculated for older pupils, and hence the distance between the desk and the seat was too great, as well as that from the seat to the floor, compelling the little pupil to hang, as it were, upon the desk, his feet not touching the floor. This position of necessity brought his face too near his book or slate, and hence taxed the power of accommodation of the eyes to a great degree; and besides, this school from its location, on the north side of the hill, is not so well lighted and ventilated as others. In the Nevada school I found a less degree of anomaly among the same grade of students than in the Kansas City schools. This I attributed to the fact that the school is in a small country town, where the children have more freedom of the field, where they are not crowded so much as our city children are, and perhaps have better ventilated school-rooms.

* * * * *

"There were 2,040 pupils examined, embracing seven different nationalities, besides several of mixed nationality.

"Of the 1,422 Americans, 300, or 21.1 per cent., have some anomaly of refraction.

"Of the 129 Germans, 32, or 24.8 per cent., are affected; of the 26 French, 5, or 19.2 per cent.; of the 15 Scotch, 3, or 20 per cent.; of the 67 Irish, 20, or 27.8 per cent.; of the 47 English, 8, or 17 per cent.; of the 11 Swedish, 3, or 27.2 per cent.; of the 93 mixed, 23, or 23.6 per cent.

"The Irish, Swedish, and Germans have the highest percentage of affections; the English, French, Scotch, and Americans the lowest percentage. Out of the whole number examined, 1,162 were girls and 878 boys; 458 had some ametropia (some anomaly of refraction). Of the 1,162 girls, 290, or 24.9 per cent., were ametropic. Of the 878 boys, 163, or 19.1 per cent., were ametropic, being a larger per cent. of affection among the girls than among the boys.

* * * * *

"Out of the 2,040 pupils, 13, or 0.6 per cent., had strabismus; 94, or 4.6 per cent., were myopic; 202, or 9.9 per cent., were hypermetropic; 42, or 2.06 per cent., were astigmatic; 99, or 4.8 per cent., had spasm of accommodation, and 63, or 3.1 per cent., had latent hypermetropia.

"We find that hypermetropia predominates; if we add latent hypermetropia and spasm of accommodation, saying nothing of astigmatism, of which the majority was hypermetropic, we have 364 hypermetropes to 94 myopes, or nearly four times as many hypermetropes as myopes, or over twice as many as all the other affections taken together. In the table, as seen, all the grades from the primary through the grammar school, high school, normal school, and university are represented, but in no instance, excepting the Kansas State University, is there anything like a gradual increase of myopia or any of the anomalies simply or collectively. In nearly all of the schools there seems to be a higher per cent. of affection in the first years; then, a little later in the course, a marked diminution, and then again an increase. Probably many of those having some trouble after remaining in school for a short time drop out, which would account for the diminution, and then, spasm of accommodation and latent hypermetropia becoming manifest later on, or perhaps developing into myopia, would account for the increase in this affection.

"School life, however, as stated above, so far as I can gather by these examinations, has little or nothing to do in the development of these anomalies. That they exist, however, in a much greater degree than is generally supposed is very evident, and that

continuous use of the eyes having these errors of refraction, whether in the school-room or out of it, if not corrected, is sure to have its evil consequences. The importance of a recognition of the existence of these anomalies, of their extreme frequency, and of detecting and correcting them, is obvious enough. We should take into consideration that spasm of accommodation and latent hypermetropia frequently exist, and that these affections often develop into myopia, and if recognized early, and timely treated by rest and glasses, much suffering and irremediable troubles are averted. Cohn and others may have been able twenty years ago to trace the development of myopia to badly appointed school rooms, but here in America our school rooms are so carefully arranged as to light, seats, desks, ventilation, etc., that we can scarcely attribute to the work in the school room the cause of anomalies. In a very great degree these errors of refraction are congenital; frequently they are latent, and if the eyes were not overtaxed by near work they would never become manifest. The evil arising from work in the school-room is that these errors of refraction are not perceived, and hence not corrected. If the teacher could be made to understand that the little pupils complaining of headache, pain through the temples, and weakness of the eyes, or dimness of vision, arose neither from stupidity nor desire to avoid study, but that these complaints were symptoms of some defect of the organ of vision, or what would be better still, let a competent oculist carefully examine each child as he enters upon each year of study in the school work, and his anomaly, if he have any, corrected, anomalies would gradually diminish."

SUPPLEMENTARY READING.

With the single exception of industrial training, no innovation has been made in the schools within the last few years for which so much is claimed, and from which such far-reaching results are expected by practical educators, as supplementary reading. To form a taste for good reading and thus overcome the evil influences of pernicious, cheap literature is the highest object which it is hoped to secure; but, apart from this, the use of the works of standard authors in connection with the regular readers, furnishes, according to the testimony of many superintendents, an excellent means of testing the pupils' ability to read understandingly, and at the same time imparts an interest to school work which nothing else can. In some cities not only standard books but instructive and entertaining periodicals are provided. This is the case at Canton, Ohio, where the effects are thus described:

"These periodicals were used for class reading supplementary to the text book, thus giving freshness, additional interest and instruction in the reading exercises. Pupils were allowed to take the papers home for evening reading, and were also permitted to use them during school hours, providing they had any spare time after the preparation of their lessons. The teachers find this school literature a valuable help in moral instruction and in the intellectual culture of the pupils. Providing reading matter so elevating in tone, and so attractive, is the best and surest way of overcoming the habit of reading the trashy, demoralizing literature of the day. There is marked improvement in taste for reading noticeable in many instances. Some pupils who were formerly addicted to dime novels and other sensational reading have voluntarily abandoned that since we are furnishing them something better. A knowledge of history, of current events, of familiar facts in science, and language culture are some of the benefits resulting from this work."

At San Francisco, Cal., "the principals as a unit want supplementary reading matter."

The school committee of Southbridge, Mass., say: "Supplementary reading, which has been gradually gaining ground for the past three years, is one of the most advantageous results of the system of free text-books. Its beneficial effects are plainly visible."

From Steubenville, Ohio, comes the following: "Supplementary readers have now been in use long enough to enable us to judge of the results. These are very satisfactory. The children can read in any book of the grade of their reader, and not merely in the one which they have learned by heart from hearing its lessons read over and over, as was so often the case when but one reading book was used in a grade, and the reading is far better in every respect."

In New Haven, Conn., "the method of teaching pursued requires much independent reading by pupils, and so the habit of reading is formed. Moreover, as supplementary to the school reading books, standard authors are being introduced and are read somewhat critically. * * * We can well afford to teach a little less of arithmetic, if by so doing we can insure a love of good books, and a habit of reading that shall be a life-long benefit."

The report of the committee on books and supplies at Lowell, Mass., mentions the subject thus: "With regard to supplementary reading for the different schools, a very small quantity was purchased, though had your committee acted according to its incli-

nation a generous sum would have been expended in this direction, as it is assured of the good resulting from a plentiful supply of choice and suitable reading matter for all the different classes."

The Washington, D. C., teachers are told that "the supplementary books, to be read at sight, are second in importance only to the text books. They should be used at least for one exercise each week. This part of the reading will show the practical results of the efforts of the teacher and pupils."

The New York City superintendent says: "The good that has been already accomplished by these supplementary readers suggests a more comprehensive application of the same general idea."

A number of titles have been lately added to the list of books authorized for use as supplementary readers in the Boston, Mass., schools.

At Bay City, Mich., a pupil must carefully read at least two books of a prescribed list before he is entitled to promotion to the next higher grade.

The opinion of Mr. George Howland, superintendent of the Chicago schools, is thus expressed: "One of the most serviceable aids in the teaching of reading, enriching the pupil's vocabulary, widening the range of his thought, and strengthening his grasp of words and their meaning, is a wise use of the supplementary readers, which to a limited amount have been in use in our schools for four or five years."

"With these books, in which most of the words, though familiar, are employed in other relations, with a few new words interspersed, the forms and meanings of the words are more permanently fixed in the mind, the alertness of thought in seizing upon the new words greatly quickened, and an ever increasing interest and power, both of thought and expression, secured, admitting the pupils to more fruitful fields in the domain of history, literature, and science."

"No outlay of money, I think, can be more usefully incurred than in furnishing a sufficient amount of well selected books for supplementary reading."

MUSIC.

The value of music in the schools has been thoroughly discussed during several years past. That the utility of the study is generally conceded is shown by the fact that it is systematically taught in nearly every city school in the country. Here and there, however, there may still be found cities of importance whose school officers see not enough good in music to permit its study to occupy the time of the scholars.

In denying the request of a number of citizens for the introduction of vocal music, the board of education of Dubuque, Iowa, adopted the report of its committee on course of study, which contained the following:

"The regular and legitimate work occupies all the time now. * * * Your committee is sure that the introduction of special matters to be taught by special teachers would seriously interfere with the regular work, and have the tendency to make such regular work superficial and of secondary importance with many pupils."

A view of the matter not infrequently taken is that of Mr. F. B. Richardson, superintendent of schools, of Woburn, Mass. He says: "That there are many advantages to be gained by means of the study of music is very evident, but it may be fairly a question whether it is the business of the schools to teach this subject as an art, and measure the progress of the pupils by the amount of pleasing harmony they can produce at a given time. As drawing is taught, not to make a finished draughtsman but to train the judgment and secure attentive observation, so music should be directed toward training the mind in such a way as to give it more power, not merely in the production of sweet sounds, but in performing the ordinary duties of life. "There is no room in the curriculum for musical training; but training in music, properly directed, may be made of great value. If this distinction and the limits of this study are kept clearly in view, the efficiency of your educational system may be increased by devoting an hour a week to this branch, otherwise the time had better be spent on some other phase of mental development."

That singing is of great value in strengthening the lungs and developing the vocal organs is never denied; that it is of direct educational importance is proved by the results shown in the schools of New York City. In the words of the superintendent, "this subject is steadily gaining ground, not merely as regards proficiency in reading or executing vocal music, but in the improvement it is working in the perception of sounds and in the consequent softness and roundness in uttering ordinary speech."

Words of commendation for music appear in nearly every city report received by the Bureau, but the ground has been so fully covered by previous reports and circulars that further extracts are unnecessary. It must be said, however, that musical instruction is not always satisfactory. Where so many different systems of instruction exist, there must necessarily be degrees of excellence; it is even possible that systems may be found in which defects largely counterbalance the excellencies; causes of local character some-

times affect the results; indifference of teachers, which it appears to be impossible to overcome, is occasionally reported. It cannot be expected, therefore, that the most flattering results will be obtained in every instance; but lack of success is not often reported, and never without some substantial reason.

There is a considerable difference of opinion as to the advisability of employing special teachers for music. Mr. John Jasper, city superintendent of the New York schools, recommends:

"Inasmuch as the by-laws now provide that all candidates for a teacher's license shall be examined in music and in drawing, and as the teachers employed before the addition of these qualifications have had sufficient time to prepare themselves to teach these subjects, that the by-laws be so amended as to prohibit the further appointment of special teachers of music and drawing."

At Lowell, Mass., the committee on music of the school board two years ago decided to dispense with the services of the supervisor of music, the results of this work being unsatisfactory. In the year following no better success was achieved, and during the past year a supervisor was again appointed. According to the last report "he has succeeded in the limited time he has been at work in bringing about a marked change for the better."

Superintendent Taylor, of the Saint Paul, Minn., schools, says that "a superintendent of music was employed by the board of education, who continued in service until two years since, when teaching music as a specialty was suspended. Since that time, until the beginning of the last school year, music was a somewhat neglected branch in our public school. Some note singing, some singing without note or system, was attempted. These methods seemed more of a disadvantage than an advantage, as none of the principles which underlie a knowledge of music were understood. * * * It seemed wise that so important a matter of culture and refinement should no longer be neglected. Consequently the board of education engaged the services of Mr. C. H. Congdon, as superintendent of music, who entered on his work at the beginning of the year."

ARITHMETIC.

The "simplification" of the study of arithmetic has been a much discussed subject during the year. Boston, Mass., has taken the initiative in action upon the question, while few other cities have done more as yet than discuss it. In April, 1886, the following was introduced in the Boston school board:

"Whereas, The study of so-called arithmetic in the grammar schools of this city covers much ground which does not come within the proper scope of arithmetic, which is the art of numbers, no small part of the time and strength of the pupils being given to merely technical applications of arithmetical rules; and

"Whereas, The exercises prescribed are often difficult beyond the best conditions of mental discipline, the problems set for the pupils being really exercises, not in arithmetic, but in logic, such as pertain to a period of life several years later:

"Resolved, That the committee on examinations are requested to inquire and report whether it is not practicable to reduce and simplify the studies and exercises now prescribed under the head of arithmetic."

The committee designated proceeded with a thorough investigation, obtaining the written opinions of all the principals of the schools concerned. Their conclusions and recommendations were thus stated:

"1. Home lessons in arithmetic should be given out only in exceptional cases.

"2. The mensuration of the trapezoid and of the trapezium, of the prism, pyramid, cone, and sphere; compound interest, cube root and its applications; equation of payments, exchange, similar surfaces, metric system, compound proportion, and compound partnership, should not be included in the required course.

"3. All exercises in fractions, commission, discount, and proportion should be confined to small numbers, and to simple subjects and processes, the main purpose throughout being to secure thoroughness, accuracy, and a reasonable degree of facility in plain, ordinary ciphering.

"4. In 'practical problems,' and in examples illustrative of arithmetical principles, all exercises are to be avoided in which a fairly intelligent and attentive child of the age concerned would find any considerable difficulty in making the statement which is preliminary to the performance of the properly arithmetical operations.

"When arithmetical work is put into the form of practical or illustrative problems, it must be for the purpose of interesting and aiding the child in the performance of the arithmetical operations, and with a view to their common utility.

"5. In oral arithmetic no racing should be permitted; but the dictation should be of moderate rapidity.

"6. The average time devoted to arithmetic throughout the primary and grammar school course should be three and a half hours a week; and in the third primary grade

not more than two hours, and in the first and second primary grades not more than three and a half hours each per week.

"And also all examinations for promotion from primary to grammar schools should be as simple as possible, and strictly confined within the limit of an hour in each subject."

The course of study was subsequently altered to include and conform to these recommendations. This was not done, however, without considerable opposition, the reduction proposed in the time being the particular feature to which objection was urged. The board of supervisors, in their report for the year ending September 1, 1887, several months after the revision of the course of study, take a hopeful view of the new departure.

In Brooklyn, N. Y., the method of presenting the study has been modified, but the quantity of work remains undisturbed. The lower grade pupils will deal only with small numbers and perform such operations as may be readily understood by them, but the grammar school work has not been lightened.

Syracuse, N. Y., reports "more real advancement" by the pupils since a similar plan has been followed. In the revised course of study for the grammar schools of Somerville, Mass., "the requirements in arithmetic have been reduced in all the classes whose work seemed excessive. This reduction was accomplished in the fourth class by the substitution of the brief course for the complete arithmetic; in the third class by the omission of denominate fractions; in the second class by omitting problems in interest; in the first class by omitting or making optional true discount, foreign exchange, compound proportion, cube root, similar surfaces, and similar solids."

CIVICS.

Instruction in civics, or the science of civil government, is eagerly called for in some quarters. Mr. Thomas Tash, superintendent of schools at Portland, Me., says:

"The labor troubles frequently occurring, the financial questions that have arisen since the war of the rebellion, and the many instances of questionable legislation in State and nation, have suggested to thoughtful persons the question whether or not the young may be educated in the public schools preparatory to a better appreciation and performance of their duties as good citizens in a republic. In countries where social distinction exists, such instruction is mainly confined to children of the governing classes; but here, where every man is a sovereign and every woman may soon become such, civic instruction should manifestly be universal."

At Frankfort, Ind., "recognizing that social instability comes from popular ignorance of law, of rights of persons and property, of the sound principles of political economy, the following work has been mapped out, and was done during the last year: 1. A study of local government—officers, institutions, elections, local improvements. 2. A study of State government—officers, educational, benevolent and penal institutions, elections, legislature. 3. A study of National Government—legislative, judicial, executive; comparison of, and relation between State and National Government; process of law-making; reasonableness of obedience to authority; national institutions and improvements. 4. A study of business relations, wealth, exchange."

OTHER STUDIES.

In the teaching of geography great changes have been made from the methods of a few years ago. According to the more recent methods many details of doubtful importance are omitted and considerably more attention is paid to local geography. The use of the moulding board has become quite general.

Nor is grammar now what it once was. Technical rules are usually reserved for the higher grades of the grammar schools, while the younger children are taught to speak correctly by means of "conversation exercises," "language lessons," etc., in which rules as such are seldom, if ever, referred to.

In history, Mr. John Jasper says: "There are still a few classes in which the 'question and answer' method prevails, but these are fortunately the great exception. Still they exist, and in them the legends of Capt. John Smith and Pocahontas are deemed of vastly more importance than the 'Purchase of Louisiana,' or the struggle of the British and French for the possession of this continent.

"All important in all grades is the constant recurrence to the skeleton outline, which should be the basis of all superstructure."

The elements of geometry have been taught in the higher grammar school classes with success in some cities. Even a little drill in this study has been found to furnish an excellent idea of logical reasoning, and as such is particularly valuable to those pupils whose school lives end with the completion of the grammar school course.

The study of German is much more common in the schools of those Western cities

whose population contains an important Teutonic element, than in the cities of the East. In Milwaukee a "superintendent of German" has recently been appointed, and more systematic, effective arrangements made for instruction in that language than ever.

In 1885-86 St. Louis employed 96 special teachers of German at a cost of \$58,000, in addition to 75 German-English teachers who had charge of rooms. There were 21,990 children, 40 per cent. of the total enrolment, who received instruction in that language.¹

The old methods of learning to spell are beginning to show the evidences of conflict from the attacks of educational reformers. A "spelling book" is a thing unknown in several city systems. "Spelling is a means, not an end," is a motto which appears to be gaining in popularity.

EXAMINATIONS AND PROMOTIONS.

The movement against written examinations, begun within the last few years, has constantly gained ground. The tendency at present is undoubtedly in the direction of greatly lessening the scope and importance of these tests. Comparatively few cities now rely implicitly upon them in determining the classification and standing of the pupils.

The views of those school officers who are most emphatic in their opposition to the system of percentages, and the reasons given for limiting its importance are generally similar to those set forth by Mr. Charles H. Morss, superintendent of the schools of Portsmouth, N. H., in his report for 1886. The following is an extract:

"The chief end and aim of much of the teaching seems to be to pass examination, and great honor and prestige is accorded to the boy or girl who scores 100 per cent. What does this signify? What is the meaning of 100 per cent. in school work? Does it mean that the pupil knows all there is to be known about the subject? Take two pupils in an examination, one receives 100 per cent. and the other 75 per cent.; does this imply that one has 25 per cent. less intelligence than the other? In another examination this might be reversed, and the perfect (?) one receive only 75 per cent. while the ignoramus (?) might in this case reach 100. A high per cent. means simply that one child has had the good luck to remember certain facts which, from lack of interest or a poorer memory, the other forgot. Examinations, then, are lotteries in which those minds that can be crammed with the most facts draw the prizes. How often do we notice that the ignoramus, so-called, develops in after life into the most successful and brilliant man of the class and makes his mark in the world, while the pupil of *marks* is never again heard from. To attempt to grade the human mind in per cents., to estimate the comparative mental capabilities of pupils by a mathematical calculation, is an absurdity.

* * * * *

"Such considerations lead us to believe that the marking system as practised is an unmitigated evil and should be abolished; that is, abolished as a means of obtaining data from which to make promotions. The good judgment and recommendation of those who know intimately the work of the pupils should be substituted as a basis for promotion. The whole theory of examinations is based on the supposition that pupils are made for the schools, and not the schools for the pupils."

Few superintendents admit the advisability of omitting examinations entirely from the school exercises, and even these whose ideas are as extreme as those of Mr. Morss agree that they exert a strong influence for good when used by teachers merely as written reviews. The principal of the high school of Fall River, Mass., though an advocate of examinations in a narrowed sphere, states the following reasons, founded on his experience, against attaching as much importance to them as formerly:

"(1) The efforts of many pupils are not distributed uniformly over the period intervening between examinations, but are often relaxed at the beginning and middle of the period and intensified near the close.

"(2) The great stress laid upon the examinations suggests to the pupil a wrong motive for study. Many pupils—often by the advice of their parents—ask to be allowed to drop a study and to select from another course a substitute, on the ground that they cannot get a high per cent. in the study to be changed. Furthermore, at the beginning of the year pupils change from one course to another, influenced by the same reason.

"(3) It is not uncommon to observe pupils—usually young ladies—who are of a sensitive and nervous temperament, and are, perhaps, morbidly conscientious, so concerned regarding the approaching examination as to be quite seriously affected in health.

"(4) There are certain exercises of the school in which no examination can be given, and these the pupils are inclined to neglect, for the reason, as they frankly say, they 'don't count.'

"(5) The written examinations fail to make a correct measure of the effort put forth by individual pupils. It is easy to pick out scholars in every class who have not been over-industrious during the month, but who, nevertheless, produce excellent examina-

¹ Since the close of the year 1886-87 it has been decided by a considerable majority in a popular election to entirely dispense with instruction in German in the city.

tion papers; while others, who in their daily work have been attentive and studious, present inferior results in their written tests.

"(6) It is difficult in written examinations to so frame the questions as to test all the powers of the mind. The portative memory is the faculty chiefly called into action.

"(7) Not only are the pupils led to study in a manner to meet merely the demands of the examination, but the teacher, unconsciously perhaps, but none the less certainly, keeps the examination in view as he shapes the character of his instruction.

"(8) Since the results of the examinations have so important consequences for the pupil, he is necessarily exposed during the time of these exercises to extraordinary temptations to seek improper means of information upon questions regarding which he feels that his knowledge is uncertain. The practice of cheating at examinations is a matter of great moral concern."

Actual experiments.—At Milwaukee, Wis., the superintendent may exempt pupils from examination upon satisfactory evidence that they are fitted for promotion. That this rule has resulted in the practical abolition of the system of examinations, without evil consequences, may be inferred from the following paragraph from the superintendent's report for 1885-86:

"The change from the system of promotions upon examinations as carried out under the directions of the board, has not been followed by these calamitous consequences which some supposed would result from the abandonment of that modern fetic of the graded system. Classes have been promoted without examination on the teacher's estimate. The standard of scholarship has not been lowered. Unmerited promotions have not embarrassed the teachers who receive the pupils promoted on record or estimate. Teachers have shown no diminution in zeal nor manifested any lack of energy since the supposed indispensable spur of examination has been removed."

Regular written tests at stated intervals have been abolished at Lima, Ohio, on the ground that they have already accomplished the thorough grading of the schools and their further use will only tend to produce narrow, mechanical, and unprogressive work.

It has recently been determined to consider the teacher's estimate only in making promotions in the schools of Cincinnati, Ohio. The new plan went into effect in February last, and though there has not been sufficient time to judge the results, the indications are regarded as hopeful. Following this action of the Cincinnati board the principals of the schools of Louisville, Ky., adopted a resolution commending the movement, and requesting their own board to take similar action.

"Shortly after the present board of education [of San Francisco, Cal.] entered upon the discharge of their duties they authorized the superintendent to notify the principals and assistant teachers that the yearly written examinations would be dispensed with, and that all promotions would be made by the principals and the class teachers, subject to appeal to the superintendent on the part of parents dissatisfied at the non-promotion of their children."

The superintendent—the above was taken from his last report—thus continues: "This method of determining the promotion or non-promotion of pupils was enforced, and so far as I have been able to learn, has met with general approbation. I have for several years been impressed with the defects of the written examination system, and could see but one argument in its favor, and that argument itself a defect. Teachers, instead of exercising an independent judgment in reference to the fitness or the unfitness of the pupils for promotion, seemed to desire to shift the responsibility. I have invariably maintained that teachers could arrive at more correct conclusions as to the status of the pupils taught by them by taking into consideration the general standing of those pupils throughout the year, than they could upon a single examination upon questions emitted from the superintendent's office. Besides, this method of promotion gave greater opportunity to take into consideration other circumstances, such as natural ability, faithfulness of application, and general character of understanding. In addition to enabling teachers to arrive at more equitable conclusions, it has been to both teachers and pupils a saving of much valuable time, and a freedom from the ordeal of trouble, vexation, and labor incident to written examinations. I am satisfied that the result of the present plan has conclusively proved the wisdom thereof, and that the promotions have been made this year with as much accuracy as before, if not more. Besides, nearly one month of actual school work and teaching has been added to the school year, inasmuch as the written examinations usually consumed nearly one month of valuable time. The teachers and pupils were thus enabled, too, to close the term without that worry and weariness heretofore noticeable."

Favorable opinions.—The sentiment opposed to examinations is by no means universal, however. The conservative school men who believe regular, systematic, written tests to be indispensable, lack neither numbers nor ability. In their report for 1886-87 the board of supervisors of Boston, Mass., devoted considerable space to the advocacy of rightly conducted examinations. They present the following:

"(1) The subject may be regarded from the teacher's standpoint. He has taught and trained his pupils in certain directions to the best of his ability. He wishes to know how well they understand what he has taught, and how well they can succeed in what he has been training them to do. How does he find out? He tries them. He finds, let it be supposed, that they stand very well all his tests. What more natural than that he should desire to have them also tested by others? He may have overlooked some points; his way of putting things may not be the way such things will be generally put by others; his standard may be a little lower than usually prevails, or even a little higher—who more than he can be interested in knowing how his work will appear to others competent to judge its worth? If he has taught to a right purpose, he has endeavored to make his pupils independent of himself; to put them, as it were, upon their own feet, and will most certainly welcome every fair trial of their ability to stand. * * *

"(2) The teacher is a public servant. They who employ him, to whom the people intrust the oversight of the work he is to do, are not only by statute law, but by the higher law of faithfulness to trusts, in duty bound to know how he discharges the responsibilities of his office. This they can know only through inspection and examination. And the more thoroughly they inspect and examine, the more they know the spirit and methods of the teacher, the more justly and closely they apply their tests to his work, the better it is for him and his pupils, so long as he works in the spirit of his profession and shows himself skilled in the delicate handling of youthful minds and hearts. * * *

"(3) The examination is advantageous to the pupils. It has a bracing effect upon them; gives them confidence in themselves, makes them more careful to understand, arouses their ambition. Of course, a just examination is referred to. It must be admitted an examination may be discouraging in its effects. * * * But examinations of this kind have never much prevailed, and are rarer now than ever before.

"(4) The schools of a city are an organized system of which each school is a part. Certain schools of one grade prepare for schools of another grade, and these still for another. In all schools of a grade there is a like or corresponding classification. The second-class grammar in one school ought to match very nearly the second-class grammar in another school. The exigencies of city life cause much moving of families from one part of the city to another. If schools are rightly classified the change of schools will not affect the standing of the transferred pupils. In all schools promotion depends mainly upon examinations. But these examinations are not uniform, nor is it essential that all should be; yet it is important that there should be some uniform examinations, in order to suggest uniform standards, and to hold like classes as closely as circumstances will allow, to like work. * * *

"(5) Without pressing the matter very strongly, it may be stated that there is a tendency in some quarters to teach with less thoroughness and persistency subjects in which there is no examination than subjects in which an examination is to follow. There may be, then, in addition to the above reasons for examinations, another, in their effect upon the teachers themselves in holding them to systematic, precise, and clear teaching and training. By no means is this remark to be taken as general. It is believed that the teachers who are bent upon doing their best work for their pupils, examination or no examination, are in the majority.

"(6) It is often said that the examination too much influences the teacher in his aims and methods, hedges in his activities, and prevents him from doing the best he knows. That raises the question, Must it of necessity have that influence? It may be answered that in the public schools of this city the 'course of study' is binding upon both teachers and examiners. In following that, there is no restriction upon the teacher's methods, no preventing the free outpouring of all that is greatest and best in him. He is to do in a large way a specified work. He is concerned for the moral and intellectual growth of his pupils, concerned for their manners as well as for their ability to answer questions. * * * Absorbed in this work he may well forget examinations. His motto may well be the old maxim, 'Take care of everything but the examination and let the examination take care of itself.' There will be much more likelihood of his pupils passing an excellent examination than if he should work with that end in view. If they fail, so much the worse for the examination. It would be pleasant to be able to say that there is no such thing in the schools as 'cramming' for examinations. It is a lessening evil, but it is still a visible one. If the influence of examinations is to lead to 'cramming' it is a heavy offset to whatever good may come from them. How can a teacher who has it before him to come into honest relations with his pupils, to bring out all that is best in them, to increase their faculty and quicken their life, to give them real knowledge and a growing independent power of thought,—how can he turn from his high calling to the lower work of simply preparing his pupils to pass a specified examination?

"(7) The attitude of the teacher and pupils towards examinations has an important bearing upon results. The constant dread of an examination, the holding it up before

the class as a terrible ordeal, the painting in vivid colors the dread consequences of a failure, and visiting with censure pupils who do not reach full success, are only so many hindrances to the success desired. Pupils are thrown into just that nervous state which weakens their confidence in themselves, deprives them, partially, of their control over their faculties, leads to confusion of thought, and takes away all pleasure from exertion. On the other hand, let the teacher look upon the examination as a matter of course, a very necessary and helpful part of the school régime, to be welcomed when the time for it has come; let his cheerful and hopeful spirit be infused into his pupils, encouraging them to undertake the test with thoughtfulness and patience, with no Damocles' sword hanging over their heads, and the results, even if not perfectly satisfactory, will be more creditable than under other circumstances, and will be the fair outcome of the ability of the class. Encouraging words, bracing up the will to undertake, are better in every way than the constant nagging to which some pupils are subjected. But suppose there are failures. In the nature of things there must be some failures, unless the class is a remarkable one. They can easily be accounted for; some of them will be very suggestive in regard to future efforts, and all will be robbed of their discouraging features. When work is carried on in a brave, hopeful, and conscientious spirit, even failures may be made helpful; and pupils who have failed may be made only the more determined to win future success."

Mr. George A. Littlefield, of Newport, R. I., thus renders his opinion in his report for the year just passed:

"Recent discussion has made examinations one of the most conspicuous of educational forces. They are standing the fire well. It is found that when wisely conducted they are a process of teaching as well as testing, are reviews pure and simple with the extraordinary power added to compel attention as nothing else can."

A complete and thorough system of examinations has been inaugurated in the schools of Philadelphia by the superintendent, Mr. James McAlister. The president of the board of education of that city, in his report for 1886, says concerning them: "The influence of these examinations in unifying the work done by the twenty-three hundred teachers in the service of the board has been deep and far-reaching; and no other work undertaken by him [the superintendent] has tended more to the general improvement of the schools."

At Oshkosh, Wis., the examination methods have recently undergone modifications, and there appears to be a willingness on the part of several members of the board to abolish examinations altogether, and to substitute the marking of daily recitations. In regard to this the superintendent says:

"I believe the adoption of this plan would be a serious mistake. Even thoroughly conscientious teachers would be inclined to 'send up' many incompetent pupils. It would give prominence to the feature of measuring a pupil in each recitation. Too much thought would be given to marking at the expense of teaching. The child would commit the lesson for the day, get his mark, and forget the lesson, there being no examination ahead. Who would stand between the teacher and the parents of such pupils as are not permitted to go forward? No two teachers mark alike. The annual classes coming to the grammar grades would represent six different opinions in reference to the worth of recitations. At present the teacher of the B grammar grade makes the lists for examination, thus securing a class of uniform capacity."

"*The Golden Mean.*"—The plan of promotion which has found favor in by far the greatest number of cities, consists of a combination of the examination and the no-examination system. These cities might be said to occupy the middle ground, where, it is claimed, the defects of both are to a great extent avoided, and the benefits retained. Uniformity of instruction and close grading are secured by examinations, but they are made less formidable by being deprived of a great deal of their former importance. On the other hand, the proficiency shown in the daily work of the pupils is taken into account to encourage evenness of effort throughout the term, and to prevent the scholars from looking forward to the examination with unnecessary trepidation.

The relative importance attached to the two factors is widely different in the various cities. In the majority, they are of equal value; but in some cities, notably Kansas City, Mo., the daily work of the pupils receives four times as much weight as the examinations in determining their standing. The marks of proficiency in daily work generally consists of the teacher's estimate of each child's work, expressed weekly or monthly, and averaged at the end of the term or year. In some cities teachers are permitted to use their own discretion in the employment of methods in arriving at their weekly or monthly estimates; they may hold examinations on their own account, or mark daily recitations, or they may make the estimates upon mere opinion as to the pupils' work, or upon a combination of the three methods. This freedom, however, is not often allowed. One method is usually officially prescribed.

The plan which has been tried in a number of cities of

Exempting a portion of each class from examination for special excellence has been quite successful. The superintendent at San José, Cal., thus describes the working of the plan there, where it has been in operation two years:

"A monthly record of the standing of each pupil is kept by the teacher and a copy sent regularly to his parents. Those who reach 90 per cent. in their studies during the year and an average of 95 per cent. in deportment were promoted as honorary pupils. Those ranking next to the honorary pupils were promoted on the recommendation of the teacher. The honorary pupils and those who were recommended number one-half of each class, and were not required to take the final examinations.

"This plan of promoting has worked well in our schools during the two years it has been in operation. It may be assumed that one-half of the pupils at least will be promoted, and this half will include those who were most regular in their attendance and most attentive to their duties while in school. It is certainly an unnecessary labor and expense to examine pupils whose daily recitation and monthly record entitle them to be ranked among the better half of the class. This method of promotion has been a decided incentive to the pupils, stimulating them to greater studiousness and better deportment; at the same time the annual examinations furnish the balance of the class an opportunity to show their ability to do the work of the next higher grade."

Mr. W. M. Crow, of Galveston, Tex., says: "Excusing one-third of the pupils from final examination on account of excellence in class studying during the term, has proved to be a healthy and far-reaching incentive to good work."

The general scheme of promotion in use at Wilmington, Del., is well spoken of by the superintendent, Mr. D. W. Harlan; it includes the promotion without examination of the half of each class bearing the best recitation marks.

Special or unusual methods.—A number of plans which have not found their way into general use, have been tried by various cities with different degrees of success. New Bedford, Mass., for several years promoted all classes in mass. The plan is still in operation in the lower grades, where it appears to work well, but its effects in the high school were disastrous. Pupils who were unprepared for the high school were admitted; and, conscious of their incapacity, soon became totally indifferent, and consequently a disturbing element in the school, affecting the more industrious scholars.

Brookline, Mass., does not promote in mass, but the method of dealing with incompetents is not far removed from the New Bedford plan. The following appears in the last report of the school committee:

"There were the usual number of children who are incapable of doing the work; and these were allowed to be promoted with the understanding that their averages should not affect the general average of the class. While, of course, a promotion under such circumstances is, in one sense, no promotion, yet when children attain a certain age and stature, there seems to be nothing else to do but to allow them to go on with a higher class and do the best they can, absorbing what benefit they may."

Age is an important consideration in the classification of the Portland, Me., schools. The superintendent says:

"While fitness in studies will, no doubt, long remain the principal basis on which promotions are made, yet in graded schools age is by no means to be overlooked in classification. This recognition of age in promotions was adopted by rule in the Portland schools earlier than in any other system of schools, so far as we have noticed." And again:

"The attainments of children differ very essentially at the same age, but there is a common law governing the growth and maturity of the mind as well as of the body. We should not be deceived by the physical appearance of children, and impose on a robust boy of fourteen years the labor and burdens which a man of twenty-five can easily bear. Mental, like muscular growth, requires time to develop. In graduating the tasks of school children, age must be taken as an approximate guide. The indiscreet assignment to children of studies or of branches of any study beyond their age and maturity, or the promotion of individuals or of classes to such studies, only produces harm."

Frequency of promotion.—The advantages of semi-annual promotions are generally recognized. Questions of expediency have in many instances prevented the change from the annual plan, but in no case where the change has been made has dissatisfaction been expressed with the results. Cities in which changes of grade occur more frequently than twice a year are the exception.

EVENING SCHOOLS.

It can not be said that this important branch of educational work has met with universal success during the past year. The great obstacle everywhere reported has been irregular attendance.

Upon the opening of an evening school the attendance for the first few sessions is almost invariably large, but when the curiosity of some is satisfied, and when others discover that hard work and not play is expected, an immediate decrease is noticed in the size of the classes. Amusements and other matters of equal importance so frequently prevent the attendance of even those who do not entirely drop off, that some have gone so far as to doubt that an evening school can be successfully conducted except in large cities. The following, from Orange, N. J., explains the situation there:

"The evening school as a whole has not met the anticipations of its supporters simply by reason of the small attendance. With the promise made for free instruction, with experienced teachers, with text-books furnished, those who have been willing to avail themselves of the advantages of the school have been very few. * * * The experience of the two winters goes to prove that the return for the money appropriated is not sufficient to warrant a continuation of the school, except possibly in the special study of mechanical drawing, and in the class for colored adults. The few who attended regularly made fair progress."

At Salem, Mass., the registration in the evening schools was 279; the average attendance in November was 155; in the following February, but 40. "The committee endeavored to induce a larger attendance at these schools, personally and by public notice in the papers at the middle of the term, but without success."

Even Milwaukee, Wis., a city with a population of 158,000, reports that "evening schools have been organized, but their lack of patronage does not encourage their continuance."

At Lewiston, Me., "notwithstanding the fact that excellent advantages are offered to pupils of evening schools, a small percentage of the boys who register derive any benefit therefrom."

The president of the Dayton, Ohio, board of education says:

"To my mind it is a serious question, and one worthy of the calm consideration of the board, whether the night grammar schools ought to be continued beyond the present year. It has been the experience of all the members of the committee having this school in charge that the attendance after the first few weeks dwindles to such a small number as not to warrant the board in the employment of half the teaching force usually appointed for that purpose. Then, too, the work of the few who do attend for the purpose of honest and conscientious study is disturbed by others who, coming to the school under the pretense of pupils, annoy teacher and school alike. Surely the substantial benefit derived from a school carried on under circumstances such as have been described can not be very great, and can not and ought not to warrant the board in the expenditure of any considerable sum of money."

Turning to more encouraging fields, we find that in St. Paul, Minn., "the general success of these schools for the past four years has made them a permanent feature in the educational system of this city." In Boston, "the order in these schools is now almost universally good. * * * It is now possible to introduce considerable classification into the elementary schools, thus utilizing to better advantage the teaching force."

During the past few years, the night schools of Philadelphia, Pa., have greatly increased in usefulness as the result of wiser and more faithful management, and this has so commended them to the city councils that the appropriation of \$10,000 for 1880 has steadily advanced to the sum of \$35,000 for 1886.

In the annual examination of the 27 evening schools of New York City, it was found that all but 1 were managed excellently; and of the 237 classes, 190 received excellent instruction, and 45 good; the discipline was excellent in nearly all the classes. The average attendance was 7,251, out of an enrolment of 19,832.

Springfield and New Bedford, Mass., may be cited as instances of smaller cities in which evening schools have been successfully conducted. In the last report of the former is found: "In both of these schools during the last two winters, as well as in the new evening school this season at Oak street, work has been done that would compare favorably with many day schools."

The evening school committee of New Bedford say: "The favorable anticipations in which we indulged a year ago in reviewing the work of the evening schools have crystallized into realities to-day, and we report with pleasure that the generous and enlightened action of the school board, in anticipating and supplying the wants of these schools, has been met by a full appreciation and use of the aids afforded. We have passed the day of experiment, and, on a broad and firm foundation, are building up our evening school system."

Even in those cities in which the success of these schools is assured irregular attendance is a great evil, which it seems to be impossible to overcome. Careful investigation on the part of the associate superintendents of the Brooklyn, N. Y., schools, led

to the conclusion that the rapid decline which is seen every year may be traced to the following causes:

"First. Indifference on the part of parents.

"Second. Difficulty of notifying parents, who are not indifferent, when their children are absent.

"Third. Admission of persons who seek amusement rather than instruction.

"Fourth. Retention of such persons until the demoralization caused by their conduct has driven many more desirable pupils from school.

"Fifth. Admission of pupils without the imposition of proper conditions as to regularity and continuance of attendance, or without the exaction of trustworthy guarantees that such conditions shall be respected.

"Sixth. Discouragement of pupils consequent upon finding themselves graded lower than they think they should be.

"Seventh. Dissatisfaction of individual pupils on account of the time devoted to studies which they consider of little value."

Of the plans of improvement suggested, the majority have been directed toward the removal of the third cause mentioned above. Upon the supposition that only those who appreciate the advantages offered them will comply with the condition, the Worcester, Mass., committee "have decided to require a deposit of \$1 from each pupil, as a guarantee of promptness; it will be refunded at the close of the term to those whose attendance has been satisfactory." This plan has proved to be quite efficacious, and has been copied in other cities.

An admission fee is used to keep out the undesirable element in Newport, R. I., and in some places a written pledge of good behavior and regular attendance has been required of each pupil, with good effect. The objection urged against the "admission fee" plan is that such a school is "not free." If the object of this and similar plans is to keep from the schools all save the earnest and studious, the plan in operation at Oshkosh, Wis., may commend itself. There each pupil pays \$1 per month tuition, but with an enrolment of 80, the average attendance is 60. "The results are satisfactory," and the percentage of attendance is quite as high as in the average day school.

NOTES FROM CITY SCHOOL REPORTS.

ALABAMA.

Anniston.—Though the condition of the city's finances made it necessary to reduce the teaching force in the fall of 1886, the prospect for greater usefulness has recently been increased by the appropriation of \$10,000 for the erection of a handsome four-room edifice.

Birmingham.—In a new city like this it can not be expected that the schools will make as favorable a showing as those of older cities, and it is not surprising to find an unusually low percentage of average attendance. In view of the many difficulties encountered, the working of the system has been remarkably smooth and harmonious. A considerable sum has been spent for additional accommodations.

Decatur.—The school system is in its infancy, having been organized this year. A small tuition fee is necessary, to supplement the amount received from taxes, to prevent the schools from falling behind financially.

Huntsville has a graded school in a new, spacious, and comfortable building.

Montgomery has expended considerable money during the past year in furnishing new buildings and furniture for the schools, and now owns one of the finest and best arranged school buildings in the South. The course of study is about the same as last year, except that physiology and supplementary reading receive more attention than before. An important change was made in the administration of the schools during the year, by which the board of education was abolished, and the city council assumed direct control of the affairs of the system.

Talladega.—The system is a new one, having been organized at the beginning of the year just passed. The course of instruction at present covers only 6 years, but its extension is contemplated. Lack of suitable quarters was the greatest difficulty experienced during the year; ample provision has been made, however, for both white and colored children for the ensuing term. One building recently completed cost \$15,000.

Tuscaloosa.—The number of children in attendance has increased nearly 50 per cent. over last year, and the cost of maintaining the schools was nearly \$2,000 more. Vocal music and industrial branches are desired. This city, also, is building a handsome brick school-house which will cost \$20,000.

ARKANSAS.

Hot Springs schools, though lacking the supervision of a superintendent, have made fine progress during the last five years. The board of directors and the principals of the schools have been earnest and thorough in the discharge of their duties, and the system is efficient and prosperous. A high school was established at the beginning of the year, opening with 44 scholars. Two of these graduated in May last. A reasonably complete laboratory and improved desks and seats, have been provided for this school, and its results have been highly satisfactory. One of the buildings of the board has been enlarged; the total seating capacity of the schools is now 950. The limit of indebtedness fixed by the constitution of the State is such that the usual expedient, the sale of bonds, cannot be resorted to for the erection of new school-houses.

CALIFORNIA.

San José.—The financial condition of the school system is excellent; though the city tax rate for schools is less than half the rate of 1884, the amount on hand at the end of the year was considerably larger. In regard to the kindergarten in operation during the year much difference of opinion exists; it is plain, however, that it is not appreciated as its merits deserve, and no demand exists for the extension of its facilities. An important step has been taken in the establishment of a library in each ward school.

San Francisco.—While the appropriations for the last year were more liberal than for several years past, the funds at the disposal of the school department were far from adequate to meet its pressing wants. Not only has the city fallen in arrears in the payment of its teachers, but it has failed to supply such buildings and school appliances as are necessary for the proper instruction of the children. The system of inspection inaugurated a few years ago has been an instrument of great good in the schools. Provision has been made for a limited amount of kindergarten work in the lower grades. The readers and arithmetics of the State series have already been adopted. These books will be sold to pupils at the actual cost of publishing; earnest endeavors will be made to make the experiment successful. Yearly written examinations have recently been dispensed with, and all promotions are now made by the principals and class teachers, subject to appeal to the superintendent by parents dissatisfied with the non-promotion of their children.

COLORADO.

Aspen.—The course of study and regulations of the schools were revised at the beginning of the year. The new course provides twelve years' study, three of which are to be devoted to the high school.

CONNECTICUT.

Bridgeport.—To provide for the increased number of children in West End, a building capable of accommodating 200 scholars has been rented. The increased number of teachers has made it possible to give more attention to individual pupils, and kept many from falling out of the classes. Evening schools for young men only were open during the winter.

Bristol.—A high school, established at the last meeting of the town, began its operations at the opening of the spring term, with 77 scholars. Its teachers are capable and its prospects flattering. By a recent vote of the school committee there may be, in addition to the regular branches laid down in the course of study, exercises in declamation, reading, and composition, at the discretion of each teacher. In the methods of teaching reading and geography special improvement is noticeable.

Enfield.—The school-houses are in good condition, since considerable attention was paid to their improvement during the year. The three high schools lack efficiency, and should be consolidated. It is proposed to begin the teaching of music and to improve the character of the instruction in penmanship, during the next year.

Greenwich reports show that the last has not been a year of satisfactory progress; indeed, many of the schools have fallen below their usual standard. For 17 years the public schools have not been as poorly attended as during 1886-87. This fact was mainly due to the opening of two private schools, one controlled by Catholics, the other by Germans, which took large numbers of children of these classes from the public schools.

Hartford.—The new buildings erected during the year, and the improvements in the hygienic condition of the old ones, have done much to advance the character of the school accommodations of the city. Irregularity of attendance had grown to be such an evil that, in order to stop it, a rule was made that no absence or tardiness may be excused except upon a physician's certificate that such absence or tardiness was caused by illness. A new course has been opened in the high school, embracing book-keeping, commercial arithmetic, instruction in business forms and commercial law as far as practicable.

This course was adopted in May for a year on trial, and as far as can now be judged, is going to prove a success. Again this year two evening schools have been conducted, one of which was partly supported by private funds; only a moderate degree of success was attained in either. A kindergarten established in one of the districts has been a very successful experiment.

Manchester.—Some of the school-houses have been very much improved in appearance and conveniences. Sufficient attention is not paid to regular attendance by either teachers or parents.

Meriden.—The greatest needs of the schools are the abrogation of the district system, and the employment of a regular superintendent. The course of study is too much encumbered with details, and should be abridged in order that essentials may be more thoroughly mastered. The study of music was introduced a year ago, and has been taught by the regular teachers with at least moderate success. The evening school of the past year was an experiment, and though not entirely satisfactory, it has met with greater success than usually falls to the lot of such schools, showing an average attendance of 249 out of a total enrolment of 498.

Middletown.—Noteworthy improvement in the matter of tardiness is reported. The attendance shows an increase except in the high school, where a falling off is noticed. Buildings are in good order, necessary repairs having been made.

New Britain.—The number enrolled this year was less by 109 than in 1885-86, a difference explained by the increased attendance in the parochial and private schools. The evening school constantly increases in its usefulness.

New Haven.—Increased attention to mechanical industry is the most important of the changes mentioned in the reports from this city. After considerable difficulty in procuring suitable rooms and a competent teacher for the new wood-working school, satisfactory arrangements were at last completed. The shop was properly fitted up and instruction was begun to 10 classes of 24 boys each at the opening of the school year. The boys were selected, by the principals of the various schools, from the two highest grammar grades, with the understanding that if they failed to maintain their records in their regular studies they were to be dropped from the carpentry class. A systematic course of lessons was given, each class receiving instruction covering two hours in every week of the term. Good results are already noticeable, and decided gain of the pupils in manual power is manifest. Two thousand five hundred girls receive weekly lessons in sewing; several of the teachers state that the girls under them have perceptibly improved in deportment and tidiness since beginning the course. Some 3,660 garments have been made. An ungraded school, formerly used as a truant school, has been discontinued, but to avoid the evil results of such action, incorrigibles are sent to other ungraded schools. The evening schools suffer from irregular attendance, an evil attributed largely to the inexperience of the teachers. The training schools have grown in favor with the graduates of the high school, and it may soon be possible to supply the demand for new teachers with home talent. The high school building is filled to its utmost capacity. Something has been done toward improving the curriculum of this school; a course in English, covering two years, has been carefully planned, and the discussion of current events introduced as a part of the regular daily programme. The works of standard authors are being generally introduced as supplementary to the school reading books. A new course of study prepared by the superintendent and a committee of teachers has been adopted.

New London.—During the year just passed the health of the children has been excellent and the attendance in the schools larger than ever before; the corps of teachers has been slightly enlarged in consequence. Success in drawing has not been as uniform as in some other studies. The school houses are in better condition than they have been for years past. The erection of new buildings, aggregating \$25,000 in cost, has been recommended by the board of education and the common council, and the appropriations therefor will doubtless be made at the next town meeting.

Norwich.—Unusual prevalence of children's diseases prevented the attendance this year from coming up to the standard of 1885-86, and the enlargement of the private schools lessened the enrolment of the city schools by 111. The teachers are interested in their work, and generally employ excellent methods. The houses and premises have been put in good repair.

Portland.—The showing made by the census this year does not compare favorably with that of last year. The enumeration is 39 less, and there are 5 more children not in school. The instruction and the character of the schools is good. Two entertainments were given during the year by the school of District No. 1, netting nearly \$50, which sum was expended for scientific apparatus and books for the library. The attendance in District No. 2 was reduced by the prevalence of scarlet fever during the last term of the year. Of the buildings, 2 are classed good, 4 fair, and 2 poor.

Rockville.—The irregular attendance of the pupils is the greatest obstacle in the way of success. A parochial school has been opened during the year with over 300 pupils,

drawn largely from the overcrowded primaries and intermediate departments of the east district.

Stafford.—The schools have enjoyed more than their usual measure of prosperity during the year just passed. Improvement is apparent in the efficiency of the teachers and in the quality of the work done.

DELAWARE.

Wilmington.—There were no radical changes during the year. The work of the schools went on steadily and with quiet energy. The attendance has not been so good as last year, though the total enrolment was 137 more. It is expected that opportunity will soon be offered for the pursuit of high school studies in the colored schools. The buildings appear to be good, supplied with good furniture, and generally well heated, but ventilation is obtained by most approved methods in but few of them.

DISTRICT OF COLUMBIA.

Washington.—The liberal provision of Congress for the erection of 7 new buildings will relieve to a considerable extent the unfortunate state of affairs shown in previous reports. But even these extensive additions to the school facilities of the city will fall far short of supplying the whole amount of desk room absolutely needed. This may be more readily understood when it is stated that 134 of the 400 white schools were limited to half-day sessions last year, and in the division embracing the colored schools the proportion of those for whom half-day sessions only were possible, was even larger. This condition of affairs was not confined to the lower grades, but even in the high school 150 of the pupils were unavoidably denied the privileges of the school, except for a half of each day of the school year. Six night schools were in session 52 evenings each, with an average attendance of about a thousand, nearly equally divided between the white and colored races; the good that these schools do is unquestioned. The past year is particularly notable as that in which manual training was first introduced in the schools of the city. The appropriation for the purpose was sufficient only to equip a school of carpentry in the high school building. Two hundred and twenty-five boys elected to take the course arranged. "The time devoted to the work was not sufficient to produce any marked results, but it is certain that it did not hinder the general progress of any boy who engaged in it, and it is equally certain that the influence of the work was beneficial in various ways in the school." The appropriation of \$5,000 for the purpose of industrial training for the next year has rendered a considerable enlargement of facilities for such work possible. It is proposed to establish three new shops in addition to that in operation during the past year. Instruction will be given in bench work, lathe working, moulding, and forging. Besides these four shops for boys, two cooking schools will be established. It is estimated that 1,300 pupils, male and female, may be trained. These will be taken from the classes between the seventh grammar grade and the last year of the high school. A clause in the appropriation bill restricting the number of teachers receiving salaries of \$900 or more has caused considerable inconvenience, and the uncertainty as to the intent of the restriction has given rise to some anxiety. Very much to the dissatisfaction of the teachers, the appropriations for the year were not sufficient to make the usual annual increases in the salaries of new teachers, except for those receiving less than \$500 per annum. "The abolition of the annual examinations at the close of the term for advancement to the high school, and the substitution instead of the average standing maintained during the year, has proven wholly beneficial."

GEORGIA.

Americus.—Attendance during 1886-87 was not as good as in the year before; an exceptionally severe winter and the prevalence of measles of a virulent type for a considerable time, are adduced as causes.

Athens.—This was the first year of organized school work. Five buildings were secured early in the year for the use of the schools until the completion of the two 10-room brick buildings that were at once provided for by the city council. Great care was taken in the selection of teachers, and an enthusiastic and well qualified corps of instructors was secured. All the desks and equipments provided are of the best obtainable, and are abundant in quantity. Not only is the city government earnest and generous in the support of the schools, but the citizens as well have shown their interest by donating \$1,000 for the establishment of a library. Despite the disadvantages surrounding an entirely new system, signal success has attended the year's work.

Atlanta.—This has been the most prosperous year in the history of the schools. The health of the city has been excellent, and no epidemic has interfered with school work. In the general appearance of the children there has been noticeable improvement; they are better clad and neater in appearance than ever before; nor is as much trouble experienced in having parents provide necessary books as formerly. The schools are well established

and the teachers proficient. The great need of the system seems to be more school houses. The high schools are not properly housed, and the accommodations for the colored pupils are not adequate.

Columbus has solved the problem of "supernumeraries" by the employment of a regular assistant teacher, who shall supply vacancies when they occur, and, when not so engaged, shall assist the regular teachers, devoting one day at a time to each teacher. The seating capacity of certain primary grades being insufficient, it was necessary to resort to half-day sessions. Supplementary readers were introduced in January, and give much satisfaction. The plan of teachers' meetings has been changed, so that now meetings of the teachers in the several schools are held regularly, and alternate with the meetings of the entire body of teachers. The enrolment this year was larger than ever before, and the schools were conducted at an unusually low cost per scholar.

Griffin.—The public school system established two years ago has steadily grown in public favor. A department has been opened during the year for the teaching of high school branches.

Macon school accommodations have been increased by two additional rooms, one of which was built with funds raised by the efforts of the teachers. Five teachers more than last year are now employed, and the enrolment exceeds that of 1885-86 by 306. The colored pupils will soon be supplied with all needed accommodations by the erection of a large new building upon a lot already provided. The board of education controls not only the city schools but those of the county, and are thus compelled to divide their attention between the two distinct systems. A great deal of time must be given to the country schools by the superintendent, and in order that this may be done without injustice to those of the city, an assistant has been provided.

Rome.—The chief want of the system is proper accommodations for the colored schools; the limited and somewhat embarrassed condition of the city's finances has made it impossible to provide for them properly.

Savannah.—The work of the year has been more than usually successful. Considerable increase has been made in the school accommodations of the city, and quite an addition has been made to the number of the out-of-town schools controlled by the board. An additional story has been built upon one city school-house, a two story addition has been erected to another, and a building containing 21 rooms and a large hall, formerly used as a hotel, has been purchased and converted into a commodious school-house. With these, all complaints of overcrowding must cease. Corporal punishment has been forbidden, and after a year's trial the teachers differ widely as to the advisability of the step, but the superintendent is convinced that the general deportment of the scholars has been better than before. An assistant teacher has been employed for each grammar school, so that the principal may be able to devote more time to the supervision of other grades than his own. The number of high school scholars is greater than usual, necessitating an additional teacher.

IDAHO.

Boisé City estimates its school property to be worth \$60,000. The instruction given embraces both the elementary and the higher branches. The total enrolment last year was 603, and the average attendance 506.

Lewiston has a fine 6-room school-house, furnished with modern appliances, the total cost of which was about \$10,000.

ILLINOIS.

Aurora.—A considerable sum has been expended for furnaces and general repairs. The school census shows that only 22 persons between 8 and 14 years of age attend no school, and only 2 between 12 and 21 can neither read nor write. The attendance has been fairly good during the year.

Belleville teachers are not as well paid as they deserve, but sufficient explanation of this may be found in the fact that the system is under the cloud of a large bonded debt, upon which a considerable sum must be annually paid as interest. With an enrolment 200 less, the average attendance was fully up to that of 1885-86, though the city was visited by an epidemic of measles during the year. A new building is being erected, which, when completed, will have cost \$25,000. It will supply all accommodations needed for some time.

Bement.—The grade of the school work has been perceptibly raised during the past year, and the scholars have improved in deportment and punctuality.

Cairo schools are crowded, and new buildings are urgently needed. Owing to limited accommodations for the high school, further additions to its library have been impossible. This school was recently placed on the list of those whose graduates are entitled to admission to the University of Illinois without examination. The general sanitary condition of the buildings in use is bad; out-houses and closets need immediate attention.

Elgin.—The course of study of the high school has been lengthened one year, and in consequence, the graduating class this year numbered only 5.

Freeport.—All the school record books have been destroyed, and no statistical or other report can be made.

Hyde Park is proud of a handsome new high school building, completed during the year. "Great pains were taken to have its arrangement, heating, ventilation, light, and construction as perfect as experience and modern science could suggest."

Joliet.—The board owns 10 buildings, of which 7 are of stone and 3 of wood; 2 of the latter have well-nigh outlived their usefulness. The supply does not equal the demand for seats, and it will soon be necessary to provide more ample accommodations. The grounds need attention. Industrial work is encouraged by holding annually an "industrial fair" for the exhibition of the handiwork of the pupils. A small admission fee is charged, and the receipts are distributed among the children as prizes. The schools every year, for the last 5 years, made an exhibit at the State fair, and have in that time secured \$250 in cash premiums and 18 diplomas. The work of the high school is fair. Changes have been suggested in its course of study which will tend to improve it. A two years' business course is proposed.

Moline.—The school board appreciates the value of ample accommodations, and has nearly completed a substantial new building of 8 rooms, which is expected to furnish all the room needed for several years. As a precaution against fire, as well as to conduce to the health and convenience of the pupils, city water has been introduced in several of the buildings. A new form of reports to parents has been adopted, in which figures have been discarded, and words used instead, to show the pupils' standing; the plan gives satisfaction to parents and relieves the teachers of much unnecessary work. The fourth annual handicraft exhibit held in April last was more successful than any of its predecessors.

Peru schools have a manual training department, in which wood working and sewing are taught.

Quincy school board has reduced its permanent indebtedness to \$1,000, and hopes to still further materially decrease it during the next year. Improvements have been made in several houses, and steam heat was introduced in one. The number of parish schools in Quincy is quite large for a city of its class, and the percentage of enrolment in the public schools to the school population is relatively small for that reason. For fully half the year epidemics of measles and scarlet fever have prevailed, seriously affecting the enrolment, attendance, and school work generally. The year, therefore, is considered an unsatisfactory one, though much good work was done.

Sterling.—The last has been a profitable year, with little interruption of the routine work of the schools from any cause. In March an "exposition" was held under the auspices of the teachers' association of the county, which developed, among others, the fact that the improvement of the children in drawing has been remarkable.

INDIANA.

Bluffton schools appear to be well organized and successful. An exposition of school work held during the year was decidedly satisfactory as an initiatory effort.

Cambridge.—The work of the schools is laid out with great exactness. A great deal of attention is paid to the study of the English language.

Crawfordsville seems to have solved the problem of punctual attendance, for with 1,293 pupils enrolled, not a single case of tardiness is reported. The regular publication of lists of all pupils perfect in attendance has been an important aid in bringing about this result. It has been possible during the year to eliminate the ninth year from the grammar school course. This extra year had been added because, with the short sessions made necessary by limited appropriations, it was impossible to properly prepare pupils for the high schools in the usual 8 years.

Crown Point also reports great improvement in the matter of promptness, the tardy record having been reduced from 753 in 1883, to 79 in 1887. The schools made a creditable exhibit at the recent National Educational Exposition in Chicago. The buildings and premises were never before in such a perfect state of repair; they will supply all demands for several years to come.

Decatur.—The new building did much to increase the success of this year's work, since its arrangement is such that school government was rendered comparatively easy; and its excellent system of ventilation had a beneficial effect upon the health of the pupils. Every room available is crowded beyond its capacity; the city needs more teachers and more buildings.

Frankfort.—Since the completion of the new 8-room building at the beginning of the year, the number of sittings has exceeded the number enrolled by over 200. Abundant accommodation is thus guaranteed for all pupils that may seek admission for a year or

two, at least. Much good has come of the teachers' efforts to stimulate in the scholars a love of good reading.

Hagerstown.—The finances of the school board are in excellent condition. The school is liberally supplied with chemical and physical apparatus.

Knightstown has a thoroughly organized and well-graded school with a course of study covering 12 years.

Michigan City.—The crowded condition of some of the rooms made it apparent at the beginning of the year that more room was essential for the proper prosecution of school work. Accordingly, a dwelling house was purchased and converted by a series of alterations into a school house. The study of language received more attention this year than formerly.

Peru.—The feature of the system is the careful and systematic study of English literature, extending through the whole course. German may be taken up in the fourth year, and when begun must be continued throughout the course. The high school may issue certificates of admission to the freshman class of the State University without examination at that institution.

Plymouth.—The work of the year has been pleasant and successful, with improvement in registration, attendance, and punctuality. Only 22 cases of tardiness occurred, and in nearly every instance the offense was committed by new scholars. An excursion to Chicago was given to the pupils and their parents, in addition to the regular commencement exercises at the end of the year.

Richmond school statistics do not make so favorable a showing as last year, either in the percentage of enrolment to school population or in the tables of attendance. Much valuable apparatus has been added to the physical and chemical laboratories, and 30 fine microscopes have been procured for the use of the classes in botany and zoölogy. Drawing has been taught under the supervision of a specialist for 2 years, and the progress made during that time has been remarkable. The plan of semi-annual promotions has also been in operation two years, and all expectations of improvement through its agency have been fully realized.

Rochester.—A step has been made towards manual training by the introduction of drawing and clay modelling.

Rockville.—The half-day system has been adopted for the first-year pupils, and has proved even more successful than the all-day plan. Drawing and music have been taught for 3 years, the former with success; the latter with such meager results that it is recommended that it be discontinued as a branch unless a special teacher can be secured.

South Bend.—The "school fair" held during the year was highly gratifying in its results, and furnished the means with which to establish a reference library in each building. The library and museum of the high school have received important additions during the year. Two flourishing literary societies, each of which supports a paper, are aids to this school. The progress in music has been very gratifying.

Vincennes.—Particular attention is paid to supplementary and sight reading. German is optional, and may be begun after the second year. The high school instruction embraces an English and a Latin course.

Warsaw.—The cost per pupil of the schools for the year 1886-87 has been slightly in advance of that for the previous year, principally because more experienced teachers were employed, at the maximum salary. The number of "tardies" has been reduced to a very low point, but the number of those absent a half day was so great as to lead to a suspicion that the sentiment against tardiness has grown to be an evil rather than a means for good.

Washington.—While the schools have not yet attained the highest standard of efficiency, they are constantly improving. A good beginning has been made towards a school library, and the excellent plan prevails of requiring each child who reads a book to write an essay upon it. The main building is undergoing repairs.

IOWA.

Council Bluffs.—The financial year has been changed, and now ends August 31, instead of December 31, as formerly.

Dubuque.—German is taught as an optional in the grammar grades, and outside of the regular school hours by special teachers. It is, however, a part of the regular high school course. The system utilizes 72 rooms for the graded schools and 1 for an ungraded school.

Iowa City high school arranges its studies in three distinct courses, with considerable latitude allowed to students in the choice of studies in the last year. A course of reading is prescribed in connection with the English course.

Lyons.—The system of grades and the course of study were amended before the beginning of the school year. The new course is arranged to cover 11 years, but under certain circumstances special promotions may be made, thereby lessening the time.

Muscatine.—The opening of the schools at the beginning of the year was delayed three weeks on account of the alarming prevalence of diphtheria. For some time after the opening the attendance in the lower classes was very scant, and the work done was of a fragmentary nature. The higher grades made quite as good progress as usual during the year.

Oskaloosa.—An exhibit in May of the handiwork of the school children excited a great deal of interest. It was the largest ever made by the children, and was regarded as a success and of great educational value. In addition to the usual teachers' meetings, weekly "grade meetings" have been introduced, affording opportunity for consultation of teachers of like grade. These have been productive of much good. Prevalence of measles among the pupils of the primary grades caused some interruption of the work of these grades in the spring, but when the epidemic subsided, the loss was almost, if not wholly, made up through the extra efforts of the teachers. The museum of the high school has received important additions. Music is skillfully taught by a specialist.

Ottumwa.—Especial attention is paid to English in the high school; the writings of standard authors are critically read and discussed in class. Singing, drawing, and penmanship are studied throughout the entire course.

West Des Moines.—The most gratifying improvement noted is that of the high school; at the beginning of the year its course was carefully and judiciously revised, and its work put on a broader and more practical basis. A pupil may now choose a 2-, 3-, or 4-year course, or, under proper restrictions, may arrange a course to suit himself. The enrolment of boys in this school has increased wonderfully, and is now 30 per cent. more than for either of the last 5 years. So great has been the influx that the building is overcrowded, and more accommodations are demanded. An evening school was opened for the first time in the city in November last, and its enrolment speedily increased from 85 to 131. It was in session four and a half months, and its success was such that it is now considered a permanent branch of the system. Kindergarten methods are employed in three of the buildings, and continue to find favor with the patrons of the schools. A manual training school is earnestly desired, and lack of funds is the only hindrance that prevents its establishment. Two new sites have been bought during the year, and \$15,000 have been spent in providing heating apparatus for four buildings. Four new rooms have been opened, and the number of sittings increased to 3,510.

KANSAS.

Atchison.—Low assessments caused the shortening of the school year by two months, and made it necessary to readjust the course in order that it might be completed in the shortened time. Despite this, inclement seasons, and the prevalence of disease, the extra efforts of the teachers accomplished good results. For reasons economic and hygienic, the first year pupils will in future attend school only a half of each day. The high school has been reorganized and the course graded and extended. There are now two courses, one of which is intended for those preparing for college, and the other for those whose school life will end with the high school. During the year a literary and musical entertainment was given by the pupils, netting over \$80.

Clay Centre.—The schools are crowded in all the grades, and in the primary schools it has been necessary to exclude all children under 6, and to make use temporarily of the half-day plan. A new 8-room building, soon to be completed, will remedy this condition of things. The attendance has been greater and more regular than in any previous year.

Kansas City.—The school system is yet undergoing the process of formation, and can not be said to have done as good work as may be expected later. The city as at present constituted was recently formed by an act of the State Legislature, by the consolidation of three distinct corporations. A thorough reorganization of all the schools was necessary to secure a reasonable degree of uniformity. Complete order has not yet been evolved, but it is hoped that by the end of next year a well organized system may be secured. Some trouble was experienced in the sale of bonds on account of an old State law, but a special act was obtained, which obviated the difficulty.

Lawrence.—The schools "move forward without jar or confusion," steadily growing in numbers and effectiveness every year. The belief expressed by many that school work is often beyond the powers of the children has induced the authorities to make a number of changes. The primary schools have been in session only a half day; studies have been arranged with a view of reducing home study to a minimum; and an additional year has added to the course with but little increase in the work.

Leavenworth.—A larger balance than usual remains in the hands of the treasurer this year, showing that the finances of the system are well cared for. The schools are crowded, and it will be necessary during the year to provide new houses, especially for the children living in the remote parts of the city. A vacant building was leased for the use of the high school and occupied, but it being ill adapted to school purposes, no little

inconvenience has resulted. Notwithstanding this drawback the school has done good work during the year; a small tuition fee is charged.

Ottawa.—Though three more teachers were employed during the past year than in 1885-86, the number of pupils in average attendance averaged 52 to each teacher. The half-day plan was adopted for the first-grade primaries and in other schools, but a rearrangement of the grades made all day sessions again possible in all but the lowest classes. More attention has been given to mental arithmetic, and some improvement has resulted.

Topeka schools have been brought up to a high state of efficiency. That they have improved in attractiveness is shown by the fact that the average attendance has increased in greater ratio than the enrolment, and that tardiness has diminished. The introduction of drawing and music added much to the labor of the teachers, since it was necessary for them to qualify themselves to instruct in these branches, yet their work has been highly commendable. Individual schools are encouraged to beautify their premises and to provide themselves with libraries and musical instruments; many of them are now quite well equipped in these respects.

KENTUCKY.

Hopkinsville.—The mildness of the last winter and the good weather that has generally prevailed during the year have been very favorable to school work. Pupils and their parents do not appreciate the value of promptness, as the number of tardinesses shows. Drawing and vocal music were placed in the course of study this year. The heating apparatus is becoming old and defective, and the adoption of better methods of heating and ventilation is being discussed.

Maysville.—The school board has abolished the office of superintendent of schools.

Newport.—A new building, a model of convenience in all its appointments, was completed January 1, and in two hours after its opening it was filled by over 500 pupils. The relief thus afforded to the other buildings made a thorough reclassification possible, and all half-day classes were discontinued as such in all but two buildings. The high school is a source of especial gratification to the citizens.

Owensborough is doing good work educationally. The citizens, by a more than two-thirds vote, have increased the *ad valorem* tax for 2 years, in order to provide new school-houses. A \$20,000 house has already been erected.

Paducah.—The regulations and course of study are undergoing revision.

LOUISIANA.

New Orleans schools receive an inadequate support. The appropriations made by the city are not in just proportion to those for other departments of the municipal government. The school houses are not what they should be in number or in quality, being not only badly crowded, but in some cases even unsafe. The teachers are poorly and irregularly paid.

MAINE.

Augusta.—Improvements over last year in many respects are noted. Fewer changes have been made in the teaching force, and the school year has been lengthened by two weeks. Teaching methods have also generally improved. Complaint is made against the district system; the supervisor states that it is impossible to obtain results commensurate with the amount of labor and money expended. Changes have been made in the text-books of arithmetic and grammar in use, the new books being considered far superior to the old. An attempt has been made to make the English course in the high school more of a practical business course. The free text-book system has been in operation a year, and all advantages expected to result from it have been fully realized. An evening school was requested by a class of 100 persons last winter, and the subject was brought up at a district meeting, but action was deferred, since the proper season for such schools had nearly passed. Except during the prevalence of measles last fall the attendance has been better than ever before. This was undoubtedly due to the passage of a more effective truant law by the city council and the employment of a truant officer.

Bangor.—The prosperity of the schools is steadily advancing. This year's class was the largest that ever graduated from the high school. Single-entry book-keeping has been introduced in the highest grammar grade.

Calais has been free from prevalent disease, but the average attendance for the year was only fair. When repairs already begun have been completed, the buildings will be in a very creditable condition. New stoves have been provided where needed, and the heating apparatus is, therefore, now generally good. Single seats have been substituted for the double desks in the high school—a change for the better.

Cape Elizabeth.—A review of the work done during the year discloses very gratifying results. The teachers have been cordially supported by the patrons of the schools, and no unfavorable incident has occurred to mar the general harmony of their relations.

Deering has opened two new schools, requiring the employment of four additional teachers. The average attendance for the year was lowered by the prevalence of contagious diseases incident to childhood. A year has been added to the grammar school course.

Gardiner.—The free text-book system is being gradually introduced. The new \$9,000 house is sufficient for all present needs of its section. With one exception, all the buildings are excellent.

Lewiston.—The excellent condition of the schools is a matter of congratulation. The teachers are enthusiastic and well posted in educational matters, and the houses generally are a credit to the city. Their number has been augmented by the completion during the year of a neat and tasteful building of 6 rooms, which is to be used for primary and intermediate schools. Notwithstanding the excellent advantages that are offered to the pupils of the evening schools, only a small proportion of the 400 enrolled derived any benefit from their attendance; irregularity, the evil so common in such schools, was the cause.

Portland.—The number of sittings has been considerably enlarged during the year. Five third-story rooms in different buildings have been fitted up for school purposes and will accommodate about 50 pupils each. An additional site has been purchased and a new house for a primary school begun upon it. Improvements are mentioned in the sanitation of the buildings; in some cases still, however, sickness of teachers and pupils is charged directly to the bad hygienic condition of school-houses. The attendance of the pupils during the year has been excellent, and the deportment good, without too frequent resort to corporal punishment. The study of single-entry book-keeping has been introduced in the higher grades of the grammar schools, to take the place of exercises in penmanship. In the two months that have elapsed since the inauguration of the change it has proved to be both interesting and profitable. A new system of teaching music has been introduced by the special teacher; it is highly spoken of. A school for the deaf is controlled by the city board, but is largely supported by the State, only \$22 of the city appropriation having been used last year.

Saco needs more schools, since those now established are badly crowded. Slight changes have been made in the list of text-books used in the high school, but some still in use were published over a score of years ago.

MASSACHUSETTS.

Adams schools are crowded and more buildings are needed. The need of an additional teacher in the high school is so great as to impair the efficiency of the school. Double daily sessions have been necessary in the lower grades of some schools, and though first intended as a temporary arrangement only, no serious objection has been urged to the permanent adoption of the plan. The percentage of attendance to school population, 75, is the highest ever reached in this city.

Amherst.—Reduction of appropriations compelled the school committee to reduce the number of weeks of school and to neglect needed repairs upon school property.

Arlington.—Harmony has distinguished the meetings of the board and the management of the schools. No material change has been made in the course, excepting the promulgation of a rule requiring the study of English three full years in the high school. The musical instruction is excellent. School buildings are generally in good order, and the expense for repairs continues to be comparatively light. Thirty new desks have been bought for the high school.

Attleborough.—The last was a year of quiet prosperity, during which no disturbance has occurred to excite public comment, as in former years. The excellent system and organization introduced by the superintendent has had the best opportunity yet afforded for showing its many advantages. So rapidly has the population of the town increased that there is again need of more school accommodations.

Beverly.—The record of the year, as a whole, is a good one. A superintendent is needed to bring the system up to its best work. A new grammar school was opened at the beginning of the year, but its continuance is somewhat doubtful, since the number of children enrolled is not so large as was expected. The entering class of the high school was unusually large this year, and necessitated the opening of a new class room.

Boston.—The school committee have made only one considerable change in the course of study, and that in regard to arithmetic. The study has been abridged by omitting a number of subjects thought to be beyond the comprehension of children or of little practical good, and simplified by confining problems to small numbers and simple subjects and processes. The time has been shortened to from two to three and one-half hours per week. The supervisors speak hopefully of the reduction now, though they opposed it at the time of its enactment.

Blackstone.—The percentage of absenteeism and non-enrolment is entirely too large for the best good of the schools, and a potent cause of it is the lack of sufficient room in certain

districts. Temporary quarters have been found for one new school in a church, and 40 pupils are there accommodated.

Bourne schools compare favorably with those of towns of similar size. Good discipline is secured with but little necessity for corporal punishment.

Braintree.—As a rule the schools are well accommodated and the discipline is generally excellent. The study of literature was systematically begun in the high school last fall. The wisdom of the free text-book system has already been proved, since it has resulted in a saving of time and money.

Brookton.—The school buildings have been generally improved during the year. The method of employing janitors is such that they can not be compelled to attend to their duties properly, and a change is desired. Music is successfully taught, but no enthusiasm is manifested in the study of drawing. The evening school is doing well.

Brookline.—Lack of sufficient accommodations causes considerable trouble, and numbers of transfers, involving some inconvenience to the children and a great deal of trouble to the school officers, have been necessary. A new building, however, is in course of erection, which will relieve the pressure. This building will be larger than any of those now standing, and will in addition furnish suitable rooms for industrial instruction. An experiment has recently been made, without cost to the town, of instruction in cooking. The plan has been successful as far as could have been expected, and the result of it is that the advisory board recommends the establishment of a vacation cooking school for girls, on the same plan as the vacation manual training school for boys. An evening school was opened in November and has continued so far with fair success, 20 scholars being in regular attendance. Slight changes have been made in the curriculum of the high school, less time being given to physical geography, and more to the study of English literature. Military drill has been introduced and has had good effect upon the discipline of the school. The number of teachers employed during the year is larger than ever before.

Cambridge.—The system has lost an unusually large number of experienced teachers, whose resignations caused serious loss to the schools. The most important event of the year has been the division of the high school into two distinct schools. Of the 500 pupils, 335 remained, with 10 of the 15 teachers, in the old building, as the "English High School." The others removed to a building specially fitted up for them and formed the "Latin High School." In the English school the work in chemistry has been extended to cover six months, and in physics to cover one year. Laboratories have been fitted up and pupils have been set to work under an experienced instructor. Latin is studied in this school for the first three years only; diplomas are given only after a full four years' course. The "city school" for pauper children has been transferred from the control of the school committee to that of the overseers of the poor, in order that manual training may be introduced without the specific appropriation which the city council failed to make. Seven classes of twelve boys each receive instruction in the use of tools in the rooms of the Cambridge Industrial Association. It is expected to make a trial of vacation schools during the coming summer. Music and drawing are systematically taught by specialists; decided improvement in the latter study is reported. The school committee have no control over the janitors, consequently the buildings are not properly cared for; at one time it was necessary to close 20 rooms in the short period of eight days, because they were too cold to be occupied.

Canton.—Through the generosity of one of its members, the board has been enabled to offer to the girls of the schools a course of lessons in cooking. One hundred and two pupils enrolled themselves as members of this class, and took lessons during school hours, making up the time thus lost from their regular studies. Besides the work done in class, the girls were encouraged to put into practical use at their homes the knowledge obtained; 2,557 dishes were thus repeated. The record shows that the instruction is such that it interests and holds the scholars, and so far from lessening the attainments of the pupils in other departments of school work, it tends to increase their interest in their regular studies. Instruction in sewing is also given by the approval of the board, but by volunteer teachers and outside of regular school hours. The no-recess plan adopted last year entails no hardship on the children, and gives general satisfaction. In the summer vacation all the buildings were thoroughly cleaned and put in good order.

Chelsea.—The scale of salaries of all assistant teachers, excepting those of the high school and the specialists, has received a new adjustment, by virtue of which length of service, and not difference of grade taught, will be the standard of rank. German and zoölogy have been introduced in the high school, but otherwise the course of study remains practically the same as formerly. In vocal music the pupils are very proficient, a fact due largely to the enthusiasm of the teachers, many of whom received thorough musical training in the schools of the city. The laws respecting truancy are not altogether effective. The evening schools have been in a measure successful, but irregularity of attendance is a serious hindrance. The drawing school is well conducted, and

notwithstanding its poor and insufficient accommodations, the work produced is of a very high order. A large brick building will be completed in time for use in September, and will provide for the increase in the number of scholars, which is expected then.

Chicago.—The percentage of attendance shows a large increase, attributed to the plan recently instituted of giving a half holiday in each month to those perfect in attendance during that time. Thorough grading has been secured through the efforts of the superintendent, who prepared the new and very effective course of study now in use. In the matter of charts, maps, and supplies of like kind, the schools were never better supplied than at present.

Cinton.—The excellence of the heating arrangements is a notable feature of the school buildings. Regularity of attendance was affected by the prevalence of scarlet fever.

Danvers.—General improvement is noticeable, and in English and composition the progress is especially marked. The plan of examination for admission to the high school is believed to be faulty, and important changes are contemplated. The pernicious effects of competitive examinations for percentages are in future to be avoided by keeping the rank of the scholars secret. The percentages will be used in the advancement of classes, but pupils will be told only if their standing is "good," "fair," or "bad." The classes of the high school are unusually large.

Dedham.—Work of instruction in the high school has been carried on this year under serious disadvantages, but the completion of the building already begun will do much for the improvement of its condition. The attendance has been excellent—somewhat better than last year. The systematic study of music under a specialist was begun this year, and good results may even now be noticed. The evening school was conducted with a large but irregular attendance; it is notable that the average for the last week was the best attained.

Everett.—Many unusual drafts have been made upon the funds of the school committee during the year, and a deficit has resulted. The accommodations appear to be better than last year, as only one district complains of overcrowding.

Fall River.—A special committee has been appointed to examine into the merits of the system of industrial education adopted in other cities and to report upon the advisability of its adoption here. A most encouraging sign of the progress of the teachers is found in the increasing popularity of periodicals devoted to professional subjects. The primary schools form a particularly important part of the system. Though they require only 3 years' study, they are attended by more children and require more teachers than all the other schools, which cannot be completed in less than 10 years. Single entry book-keeping has been introduced in the last year of the grammar school course, and has given the pupils excellent practice in penmanship, and some knowledge of business transactions without interfering with the other studies. Twenty-one rooms for evening schools, each room in charge of two teachers, were opened in December last. The evening drawing schools are not attended as well as they should be. The importance of the study of music and drawing is appreciated, as is evidenced by the recent employment of special teachers for these branches. One of the finest high school buildings in the country has just been donated by a private individual, who also gave the school \$50,000, the income of which will be applied to instruction in mechanical, chemical, and philosophical branches.

Fitchburg.—With the growth of the city has naturally come a large increase in the number of scholars in the schools. During the year two new houses of two rooms each have been opened, and these, with the recently established Catholic parochial schools, have relieved the pressure in the portion of the city in which they stand. In other quarters, however, the crowding still continues. The school board has adopted a new schedule of salaries, based on length of service, putting a premium upon experience and continued service. The evening schools have not accomplished as much as their friends anticipated, for they have not been well graded, the attendance has been irregular, and experienced teachers could not be obtained.

Framingham.—Among the improvements reported are a scientific laboratory with provision for individual experiment, and 4 new school rooms. Interest in vocal music steadily increases. The number of teachers has been augmented.

Franklin has expended a considerable amount in improvement and repairs. The attendance for the year has not been up to the expectations of the committee, and the explanation is found in the eagerness of the children to earn money.

Gloucester.—The year has been one of steady progress in school affairs, the suburban schools showing especial improvement. Parochial schools were opened in January, which withdrew a little over 200 scholars from the public schools for the remainder of the year. This fact affords a reasonable explanation for the decreased enrolment and attendance shown by the statistics. An offer of kindergarten materials and a fund to partially defray the expenses of a public kindergarten was regretfully declined by the school committee, as the city could not afford the additional expense the acceptance of

the offer would involve. The old high school building, with all its furniture and apparatus, including the equipments of the military battalion, was consumed by fire in June. The city council has met the emergency by a liberal appropriation for a new building, immeasurably superior to the old one. The new house will comfortably seat nearly 400 pupils.

Great Barrington.—The principal schools are full to overflowing, and at the present rate of increase more buildings will soon be needed. The necessity for better supervision is felt, and a plan is suggested by which the principal of the high school may be supplied with an additional teacher and devote a part of his time to the supervision of the schools. Considerable difficulty is experienced from absence and tardiness. Special attention is paid in the high school to the study of local and national government and the duties of citizenship. In all the grades the instruction in mathematics is very thorough.

Haverhill.—The number of pupils connected with the schools during the year has been the largest in the history of the city. The affairs of the system have been economically administered, and the real cost per pupil was reduced by \$1.70. The method of promotion has been altered and the daily work of the pupils and the judgment of the teacher will have an equal bearing with the two examinations. The no-recess plan was adopted for the primary and grammar grades, and after a trial of a year has proved itself to be a wise measure. The names on the register of the evening school are constantly changing, and the result is little real progress. Excepting 2, the buildings are good; they will afford sufficient room for the increased numbers that will be enrolled in the fall.

Holliston.—The schools have been conducted during the past year without a superintendent; attempts were made to join with some other town to secure one, but without success. Early in the year the committee arranged a more systematic course of study for the schools, and issued printed instructions for the guidance of teachers. Instruction in music was more thorough and systematic than was possible in previous years.

Hopkinton.—It is impossible to secure the best returns for the money expended under the circumstances that now prevail, since the districts are so numerous and small that effective organization cannot be secured. The attendance during the past year was not all it should have been, one-seventh of the school time of the pupils having been lost by absence.

Hyde Park.—By generous appropriations the committee has been enabled to maintain in the schools a higher standard than usual this year. Fire-escapes and city water have been provided for the largest buildings, conducting both to the comfort and to the safety of the children. A number of carpenters' benches with the necessary tools were presented to the committee by a public-spirited citizen, and with these an experimental school of carpentry was opened, and in a short session met with good success, resulting in the recommendation by the committee that it be made a permanent feature of the system. The evening school was conducted with success.

Lee.—The school population of the town has constantly decreased for several years past, and naturally the school attendance has also diminished. A more marked falling off than usual, however, appears in the latter during the past year, as the result of the opening of a convent school. Instead of the lack of school room complained of in previous reports, there is now more than is needed, and consolidation and reduction in the number of the schools will soon be in order.

Leominster reports an improved condition of school buildings, and an enrolment increased by 150. Unforeseen contingencies have raised the expenses to several hundred dollars more than the amount received. Additional teachers and increased appropriations will be needed next year.

Lowell.—The school committee complains bitterly of insufficient appropriations. The teachers are poorly paid, and the buildings in some districts are not adequate for the requirements of their localities, and many of them have become old, unhealthy, and useless. Music has not been a success, and little interest is manifested in the study. One thousand nine hundred scholars were instructed in the evening schools at a cost of \$10,125. Six school-rooms and 4 teachers were added during the year. The equipment of the battalion of cadets has been greatly improved, and more interest than ever is shown in the military drills.

Lynn.—The evil of truancy causes much trouble, and the establishment of a school for incorrigibles is recommended. Irregular attendance affects the work of some of the schools to an undesirable extent. Considerable attention has been given to the sanitation of the buildings, and in this respect their condition is better than ever before. Additional accommodations are needed. This is especially true of the high school, where 325 scholars are crowded in a building whose seating capacity is only 284. To provide the better for those scholars who expect to remain in the high school for 1 or 2 years only, it is proposed to establish an English high school, whose course of study shall be especially adapted to this class of students. The evening schools, especially those devoted to book-keeping and short-hand, are firmly established and successful. Special

instruction in penmanship has been discontinued, the regular teachers doing the entire work. A new system of teaching music was introduced this year, and has been highly successful. The subject of industrial training is under the consideration of a special committee. Its adoption is doubtful.

Marblehead has no superintendent, and the schools show the want of constant supervision. The primary schools particularly are irregular in their instruction. The attendance is not as good as the best interests of the schools demand, and a truant school is sadly needed.

Medford.—A new building has been erected, which is the most inviting in appearance and the best appointed in the town. An appropriation is recommended for an evening school, none having hitherto been in existence here.

Melrose.—The instruction given is of good quality, and the facilities for school work are excellent. The necessity for a superintendent becomes continually more apparent.

Milford.—The division of the town and the incorporation of a part of it under a new name by an act of the Legislature took from the Milford school system four schools and considerably affected the school statistics. The evening schools are not successful, though every inducement is offered to secure regular attendance. Interest in drawing has been fully sustained.

Montague.—Twenty-eight per cent. of all the money expended by the town is devoted to the education of the children. A new high school has recently been established, and is doing well.

Needham.—The regulations and course of study have been revised and printed for use at the beginning of 1887-88.

Newburyport.—The schools are highly prosperous, the rooms well filled, and the pupils generally interested. The high school is in a more satisfactory condition than for years past; the work done has been thorough and the discipline excellent. During the year the teachers and scholars have established a library of 300 volumes, without cost to the town.

North Adams.—After a series of transfers it has been possible to abandon two undesirable buildings, and, general repairs having been made on the others, the present school accommodations are better than ever before. Necessity no longer exists for a new school as at the latter part of last year, since a Roman Catholic school has been opened, drawing a considerable number of children from the public schools. Better success has been attained in the evening schools than in any previous year. Sufficient aid is not received by the teachers from the truant officers.

North Brookfield has passed through a year of quiet, steady work with no great difficulties to contend against, and no unusual improvements made. A school paper has been established and an entertainment given by the high school, for the purpose of buying a piano.

Northampton is without proper arrangement for the confinement and instruction of habitual truants, and the law respecting them can be successfully resisted. All the school buildings, with a single exception, are in good repair and furnish comfortable accommodations. An evening school was opened with an enrolment of 84 pupils, but so irregular was the attendance that not more than a dozen derived any real benefit from it. The evening draughting classes were quite successfully conducted.

Northbridge.—The school work has been similar to that of previous years, presenting no especial feature or noteworthy change.

Peabody.—Both enrolment and attendance show increase over previous years. Greater thoroughness in instruction is desired, and with the object of securing this the committee has directed that the length of the lessons be lessened. The course in music used for several years is now being carried out with greater exactness than was ever before obtained. The need of a superintendent is felt. The building burned a short time since has been rebuilt with the money received from insurance.

Pittsfield schools are too small and too numerous to accomplish the best results. The sanitary condition of some of the houses is bad, and should receive immediate attention. Truancy has caused more trouble than ever before, a fact probably due to the failure of the judicial authorities to sustain the truancy regulations of the school committee. The efficiency of the drawing school has increased and a larger number of scholars have availed themselves of its privileges.

Randolph.—The corps of teachers still remains unchanged. The health of the children has been remarkable good, not a death having been reported.

Rockland.—This has been a year of good, substantial work in the schools. The introduction of music in the primary schools has done much to enliven the work, and has been of great benefit to the children. The evening school has not been as successful this winter as last, the number in attendance being so small as to render the continuance of the school doubtful.

Salem.—The study of book-keeping, and of physiology and hygiene, though authorized some time before, was begun this year in the grammar schools. The second annual industrial exhibit of the children of one of the schools was highly creditable, and the judges were so well pleased that they contributed liberally to purchase a full set of carpenters' tools for the use of the pupils of that school.

Salisbury.—By an act of the State Legislature, a large portion of the town has been annexed to Amesbury, leaving only 6 schools instead of 20 under the control of the Salisbury committee.

Somerville.—The work of the grammar school has been curtailed in order that essentials may be more thoroughly mastered, and that the work may be accomplished, generally, during school hours. A library has been selected and a catalogue prepared. An additional primary school has been established. Of the class entering the high school in 1882, 50 per cent. graduated last June and 25 per cent. have entered various colleges. Two new houses are being erected and will be finished during the coming summer. The cost of each will be \$10,500, exclusive of land, heating apparatus, and furniture. The prevalence of truancy causes much solicitude.

Southbridge.—The higher grades have been unfortunate in suffering from frequent changes in the teaching force. All the schools except the high school were in session one week longer than usual this year, increasing the expenditures by about \$200. A new course of study has been put in operation, which aims to be thoroughly practical as far as possible. It is to be elastic, so that special promotions are permissible, and special students may be accommodated in the high school. The houses are not in keeping with the requirements of the system. Their sanitary condition is bad, the heating apparatus defective, and the yards unattractive. The schools lack thorough discipline.

Spencer is troubled with crowded primaries; some rooms that were intended for not more than 70 scholars have been packed with 100 or more. Drawing has been well taught by a special teacher, employed this year for the first time.

Springfield.—The preparations for instruction in carpentry were completed at the beginning of the year, and 84 boys from the grammar and high schools volunteered to take the course of 15 lessons. One and a half hours per week were devoted to the work, which was so arranged that no time was lost from the regular recitations. The school was successful to such an extent that the committee recommends that the city government increase the appropriation for this purpose from one to five thousand dollars, in order that manual education may be more extensively introduced, and upon a more satisfactory basis. The establishment of a kindergarten is being considered also. The schools generally are not as efficient as they should be, and a great reason for their shortcomings is the badly overcrowded condition of so many of the rooms. The department system of teaching is on trial in one of the grammar schools, and its results have so far been quite encouraging. The evening schools are thoroughly organized and compare favorably with some of the day schools.

Stoneham.—The general good condition of the school is cause for congratulation, and to the earnest efforts of the teachers much credit is due. The discipline in the majority of the schools is very good.

Taunton.—Floods during the spring reduced the percentage of attendance, but even had these not occurred the percentage would not have been as high as it might have been had parents been less lenient with their children. The hygienic condition of the buildings has been investigated, and where defects were found the remedy was applied as far as possible. The cost of the free text-book system for the year has been \$5,000—\$1,000 less than last year. The system, by the way, does not appear to give satisfaction here; the superintendent opposes it as taking too much of his time and that of the teachers. A scientific laboratory is being provided for the high school, \$500 having been appropriated for that purpose during the year. The evening and drawing schools are in good condition and are doing good work. The high school offers four courses, with a considerable range of electives. Flexibility is the distinguishing characteristic of the courses. Music is taught by a specialist and excellent results are attained. The superintendent's report does not indicate a very high state of efficiency in the schools.

Waltham.—Early in the year a sub-committee of the board was appointed to investigate the subject of manual training, and to propose a feasible and economical plan of grafting it upon the public school system. The committee has devised a scheme by which elementary manual instruction may be given to those pupils who desire it, and which will in no way interfere with the regular school exercises. The plan will receive a fair trial. Five hundred and thirty-eight girls received instruction in sewing during the year. The no-recess plan has been adopted for the high school, but sufficient time has not yet elapsed to judge of its merits. The holding of elections in two of the school-houses causes serious interference with the work of these schools. The evening schools show constant improvement; the drawing school is not yet as well attended as its excellence merits.

Watertown.—The school year has been changed, so that it now contains two terms instead of three, as formerly. A training school for teachers has been established, and

young ladies may enter as pupil teachers, receiving no pay, but improving themselves by observation and practice. Sewing has been introduced and is taught one hour per week by the regular teachers. A great deal of additional material for object teaching has been purchased. A new primary school has been established; transfers and reorganizations have been made where deemed expedient.

Webster's school committee has indulged in extensive repairs this year, which have resulted in the expenditure of more money than was appropriated by the town. A few changes have been made in the text-books used, on advantageous terms. Neither drawing nor music has as yet been introduced; but public sentiment seems to demand them, and both will probably be incorporated in the course of study at no distant day.

West Springfield.—The salaries paid to teachers are not sufficient to hold the best, and the schools suffer from constant resignations. All grammar school studies have been eliminated from the high school course, thus raising the grade of the school. A new method of teaching music has been adopted, and perceptible improvement has already resulted. An evening school was conducted three evenings a week for twenty weeks.

Westboro.—The method of supervision has been changed during the year. That responsibility now rests upon one of the members of the board, while the principal of the high school, who has hitherto acted as superintendent of the other schools as well, confines his attention to the high school only. In the large graded schools the year has been a prosperous one, with the average attendance considerably better than the preceding year; but the condition of the ungraded schools is neither satisfactory nor hopeful.

Westfield.—That popular interest in the schools is increasing is shown by the decrease in the number of parents applying for certificates of school attendance, and by the small number of cases of truancy. The evening schools are well conducted, but with the exception of the drawing class are but poorly attended.

Weymouth.—The teachers' meetings held during the year have been of more than usual interest. The superintendent considers the lack of musical instruction "the one great weakness of the schools." Many long-needed improvements have been made in the school-houses.

Woburn reports a remarkable increase in attendance. Two new schools were opened, and one was discontinued during the year. The course of study adopted in 1835 is now well understood, and so far from causing trouble, as it occasionally did for a time after its introduction, the work done under it is better both in quality and in quantity.

MICHIGAN.

Ann Arbor schools have suffered terribly from a widespread epidemic of measles that prevailed during last February and March. Nearly 200 pupils were daily absent on account of sickness during that time, and 7,399 school days were lost from the total attendance. Some of the rooms were closed for a time and work was retarded in all. As a natural result, the character of the work accomplished during the year has been below the average both in thoroughness and in the amount. Nearly 100 of the pupils withdrawn during the epidemic did not return. The work of the high school has been fairly good, though the number in attendance exceeds the capacity of the building. The remedy for this was found in paying the regular teachers extra wages to teach the surplus classes out of the usual school hours.

Bay City.—An excellent course of reading is arranged for each school year after the fifth, and the pupil must have read at least two of the prescribed books before he may be entitled to promotion to the next higher grade. A physical laboratory is in course of construction for the high school. By a recent act of the State Legislature the limits of the school district were made to conform to those of the town.

Coldwater.—Early in the year diphtheria prevailed to some extent, creating uneasiness among the patrons of the schools and necessitating the closing of all the schools for two weeks. This cessation caused serious interruption in the work. More attention is being paid to English literature than formerly. The furniture and school apparatus generally have been improved during the year. The high school has four courses of four years each, arranged with special reference to the requirements for admission to the State University.

Fenton.—The studies of the primary, grammar, and high school departments require four years attention each. The high school is said to be one of the best in the State, having been on the "accepted list" of the University of Michigan for 13 years. Besides the regular 4-year courses arranged for the double purpose of preparation for the University and affording a practical business education, a two years' "teachers' course" is provided for persons expecting to teach, but who cannot devote more than two years to study. A short fall course in pedagogy may be taken by those who desire to teach during the winter.

Grand Rapids.—Extensive additions to the school facilities are reported, but it appears that the work of providing for the increase in the school population is a never ending

task, for already 16 new rooms are receiving the attention of the building committee. The salaries of the teachers were raised somewhat by the adoption of a new schedule in May. The appointment of an assistant to the superintendent has been a great relief to that officer, enabling him to devote his entire time to the more important matters pertaining to the management of the schools. The high school building is not conveniently situated, and in other respects is not well adapted to the needs of the school. The charter has been so amended as to permit the city to furnish text-books and supplies free to school children.

Hastings boasts of "excellent school buildings, and efficient and thorough corps of teachers and the hearty co-operation of the citizens with the school authorities." A teachers' class, for the benefit of the teachers of the county, is conducted parts of the year, and members of the class frequently inspect the schools and witness the practical application of the principles studied. Annual examinations of teachers are no longer held, but teachers are required to pursue the course of study prescribed by the State Reading Circle. The percentages of enrolment and attendance show satisfactory increase over last year.

Jackson.—A physical and chemical laboratory has been recently provided for the high school.

Marshall.—The schools are equipped with all appliances necessary for good instruction. The school library contains 500 well-selected reference and miscellaneous books, 150 of which were added during the year. Besides the general library, it is intended to place in each room a case of books especially suited to the age and advancement of the pupils of that room. Stenography is taught in the high school.

Monroe.—The scheme of studies of the high school has been revised and "adapted to the latest requirements for admission to the University of Michigan. Care has also been taken to adapt the course to the wants of those not expecting to enter college." There are four well-defined courses, each covering four years.

Pontiac.—A commercial course, designed to be a thorough preparation for business, has been added to the curriculum of the high school.

MINNESOTA.

Duluth.—It is apparent that the progress of the schools has not been as rapid as in the previous year. Private schools have drawn away many who had previously attended the public schools, and contagious diseases have been quite prevalent. A high school building, completed in January last, is an excellent and handsome building.

Mankato.—It has been impossible to obtain a rigid classification of pupils, because of the unusual division of the population and the unfavorable situation of the buildings. Small libraries have been established in several of the rooms, in many cases by the efforts of the children themselves. The success achieved in drawing has been very flattering. The facilities for doing high school work are not up to the needs of the town. The out-houses and closets provided are neither private nor comfortable.

Minneapolis.—The growth of the schools has been remarkable. The enrolment in the day schools has increased by 2,000, and in the evening schools by 522 over 1885-86. The board has provided for this increase by erecting four new eight-room houses and one twelve-room building, besides extensive additions to those already standing. Even with these additions to the seating capacity it will be necessary to refuse admission to several hundred children or to institute half-day sessions in several of the schools. The large addition to the Central High School, now in course of erection, will, besides supplying additional seating capacity, furnish the space necessary for the new manual training department, a large and well-lighted room for drawing, and a fine assembly room. The basement of this annex has already been fitted up with all appliances necessary for instruction in carpentry, and in February the first class of 30 boys began the work with enthusiasm; all continued to the end of the year. The class spends 80 minutes daily in the shop and 40 minutes in the drawing-room. Nothing but wood-working and mechanical drawing has yet been attempted. As far as may be judged in the short time, the experiment has been highly successful. Plans have been formed for the organization of a training class for teachers in September next; a course in pedagogy to cover a year has been arranged. It is hoped to extend both the scope and the time of this work in the course of time. "Arbor Day" was celebrated by all the schools with appropriate exercises. Incidental to the study of music, a juvenile concert was given in April; it was a success in all substantial respects, tending to improve the singing of the children and to increase their interest in the study. The total expenditures of the system were \$23,213 more than last year, and closely approached a half million dollars. The regular work of the schools has progressed quietly and prosperously.

Red Wing.—The rules laid down for the working of the system are complete and practical, and the course of study well arranged, though hardly up to the times in some respects.

St. Cloud has issued bonds to the amount of \$20,000 for new school buildings.

St. Paul.—An extension of the territorial limits of the city by act of the State Legislature has brought in the city 3 additional school districts, all of which are sufficiently provided with school facilities for the present at least. The high school department has been particularly prosperous during the year, and its growth has been such that the board has ordered the erection for its use of 14 additional rooms, comprising class-rooms, a chemical laboratory, and apartments for the commercial department and the contemplated manual training school. A great deal of interest has been awakened in the last-named innovation, and its results are awaited with high hopes. Special instruction in music was resumed this year after that branch had remained somewhat neglected for two years. New houses, aggregating \$75,000 in cost and containing a total of 1,330 sittings, were added to the system during the year. Attention is being paid to school sanitation, and it will not be long before every building in the city is supplied with all proper appliances for furnishing heat, air, and water.

Stillwater.—The number of trustees has been increased from 5 to 7, and their powers of taxation have been enlarged. The method of their election has also been altered, and they are now chosen directly by the people at a special election.

MISSISSIPPI.

Meridian.—The recently established public schools have continued the sound progress so well begun last year. A general superintendent has been appointed and several new teachers engaged. The inadequacy of the buildings is the greatest hindrance yet to be overcome. The curriculum has been materially changed by the introduction of industrial branches in the higher grades; telegraphy, type-writing, drawing, and wood-working are studies regularly pursued. A gymnasium has been provided, that physical exercise may not be neglected.

MISSOURI.

Kansas City has made wonderful progress in the last few years, and the public schools have kept pace with the growth of the city. Fifty-five more teachers were employed in 1886-87 than in the year before, and for 1887-88 the number has been still further increased by 50, yet, notwithstanding these additions to the force, the problem of providing for all applicants for admission to the schools still remains unsolved. Three new buildings have been finished since the last report, and others are in course of erection. Meetings of teachers have been frequent and fruitful of good results. A careful examination of the eyes of the pupils of the schools of the city and of those of neighboring educational institutions during the year developed a number of interesting and important facts. It was shown that defective vision is more common in the lowest grades than among more advanced scholars, and that in no instance, except the Kansas State University, is there anything like a gradual increase of optical affections from grade to grade. This fact is taken as evidence that such diseases are necessarily aggravated by school work.

Moberly has a well-selected school library of 600 volumes, purchased by a club organized for that purpose.

St. Charles issues its first printed report this year.

St. Joseph.—The schools are well attended and prosperous. Notwithstanding the recently completed additions to three of the buildings, still further extension of the school facilities is needed. The colored schools are in excellent condition and are increasing in numbers and usefulness.

Sedalia.—The average attendance has been unusually small this year, owing to the alarming prevalence of contagious diseases. An exhibit of examination papers and specimens of school work at the close of the term attracted a great deal of attention.

NEBRASKA.

Lincoln.—Eleven years' work is minutely described in the manual of the public schools for 1886-87. The course includes music and free-hand drawing.

Omaha practically tested the free text-book system this year at a cost of \$12,000. The board of education has been increased from 9 to 15 members. The school elections will in future be held at different times from the city elections, and at school-houses. Women are now allowed to vote at such elections.

NEW HAMPSHIRE.

Dover.—The system of marking and promotion has been radically changed, and upon the teacher the responsibility of promotion largely rests; an appeal may be made from her decision to the sub-committee in charge of the school, and the decision of the sub-committee must be final. Not enough attention was paid to light and ventilation in the construction of the buildings, and many alterations are now needed. Salaries of teachers are not sufficient to retain the best.

Keene, Town District.—The condition of the schools is already fairly satisfactory, though the system is a new one. Much should be done in the way of repairs.

Keene, Union District.—The district has lost 317 scholars by the organization of a parochial school. The withdrawal of so many pupils disturbed the schools to some extent and required considerable labor to redistribute the remaining scholars. The system, however, has regained its equilibrium, but there are three fewer schools than before. The building of the new \$1,300 house and the loss of so many pupils will render the further use of rented rooms unnecessary. An evening school was in session fourteen weeks during the year, and though the attendance was irregular, good progress was made.

Rochester.—An experiment of the town system has been made during the last year. Not enough money is expended for repairs, and some of the buildings are not in proper condition for use. Music is under the charge of a special teacher and is "an assured success."

Somersworth.—Two marked changes have been made this year which go far toward perfecting the system. These are the furnishing of all text-books in the grades below the high school, and the introduction of the study of music. Both these innovations have shown themselves to be beneficial, facilitating school work and adding interest to the studies.

NEW JERSEY.

Elizabeth has organized a central high school. The high schools have hitherto been mere departments of the schools, and the change is regarded as a great improvement in the system.

Morristown.—A \$20,000 school-house was recently completed.

Orange.—An evening class in drawing has been formed and is meeting with good success; with this exception, however, the evening school does not flourish as its supporters hoped, and its continuation is not warranted by the results obtained. The heating apparatus of two buildings have been improved. The attendance in the schools was 1 per cent. better than in 1885-86.

Rahway.—The schools are in good working order and are showing good results.

NEW YORK.

Albany, with exactly the same enrolment as in the year previous, reports the average attendance as 138 more; even greater improvement than this would have been shown if the accommodations had been more ample. The condition of the schools in respect to discipline was never more healthy than during the past year. The drawing exhibition this year was more than usually interesting, and attracted thousands of visitors. Interest has been awakened in manual training, and a committee appointed by the board to investigate the matter has rendered a report favorable to the adoption of a plan through which it will receive a thorough test. A number of changes have been made in the curriculum of the high school, the practical departments of mathematics and English being especially strengthened, and certain sciences, which in the time allotted to them could be only superficially studied, being eliminated.

Auburn is erecting a new house for the use of the high school. Its total cost will be scarcely less than \$75,000. Of this, \$40,000 was borrowed upon advantageous terms from the State. An important departure from the former methods of teaching reading was experimentally tried in the highest grade of one of the grammar schools during the year. The old reader was entirely discarded, and Irving's "Alhambra" substituted in its stead. The pupils were allowed no previous preparation, and the books were distributed just before the exercise was to begin. The plan was not successful at first, but as the pupils became interested in the subject-matter of the book they read with surprising ease and expression. The results were so satisfactory in the end that the plan will be extended to the other schools. The attendance of the children enrolled continues to be regular and punctual as in former years, but the impression prevails that the number of idlers and truants in the city is constantly increasing. The sanitary condition of the schools is excellent.

Binghamton.—During the past year the study of vocal music was added to the curriculum, and a marked degree of efficiency has already been attained. The usual good health of the children is the best evidence of the good sanitary condition of the buildings and their surroundings.

Brooklyn.—Substantial improvement has been made during the last 5 years in many respects, as the statistics show. Better grading has been secured, and although the requirements for promotion have been made more severe with each succeeding year, the proportion of those promoted to the average attendance is steadily increasing. Thoroughness in the primary grades is an important factor in securing this result, and especial precautions are taken in promoting the primary pupils. The effect of this is seen in slightly decreased proportion of promotion to the grammar schools. By the use of judicious methods the numbers in the higher and lower grades have been nearly correctly adjusted. Since 1832 a great deal of time and thought has been given to the revision of the course of study. The superintendent has visited other cities and examined

the methods and means in vogue in other places. The result of his labors has been submitted to the board of education. The main object of the new course is to lessen rote work and cramming as far as possible, and to secure more thorough grading. In July, 1886, the curriculum of the Central School was extended by the adoption of a three-years' language course and the extension of the commercial course from 1 to 2 years. This school is not yet a full-grade high school, since no branches are taught save those necessary to fit young ladies for teaching, and to prepare young men for the every-day affairs of life. The evening schools appear to prosper; the average attendance is greater by 109 than last year. The training school for teachers, established in 1884, has achieved such success that the opening of another of the same kind is considered advisable. A change was recently made in the method of examining teachers for "A" or grammar school certificates. Formerly those selected for promotion from the primary grades were subjected to a special examination, but by the late rule all eligible for promotion are examined at stated times, and selections are made from the number who pass to fill the higher positions. The accommodations are fairly adequate, the whole number of sittings being greater than the whole number in average attendance, but the three lowest primary grades are overcrowded to such an extent that in some cases half-day classes have been necessary. Four buildings were erected during the year, and are said to be admirably adapted to their purpose. The annexation of the town of New Lots to Brooklyn gave the board jurisdiction over 6 new schools. The increase in enrolment over 1885-86 is 2,296.

Canandaigua.—A board of education was elected in December last, but no radical changes were made until the close of the school year. Then the plans were perfected for a complete overhauling of the system. The schools were regraded and an academic department, introducing all the studies of the advanced regents, established. New and better text-books will be substituted in proper time. With school buildings in good repair, and with good laboratory facilities, the prospects of the re-organized schools seem particularly bright.

Gloversville.—Instruction in drawing has been given in all grades with highly gratifying results. The regents' advanced examinations have been introduced and the passing of two of them made a requisite for graduation. The enrolment and attendance for 1886-87 exceeded those of any previous year. Many of the school-rooms are small and badly ventilated.

Hornellsville.—The facts of importance mentioned in the report for 1886-87 are shown in our statistical tables.

Ithaca.—A business department is to be added to the advantages offered by the high school. The special instruction in penmanship in all the classes promises to become a marked success. The average attendance has been slightly below that of the preceding year on account of the prevalence of diphtheria in the autumn of 1886.

Jamestown.—Prominent in the catalogue of the city schools appear the departments of physical culture and industrial training. Printing, stenography, type-writing, cabinet-making, sewing, and knitting are taught.

Kingston.—The attendance has not, for various reasons, been as good as last year, but the character of the instruction given was better than ever before. By a new law, the district will receive over \$600 more than at present from the State. The academy continues to maintain a high standard of excellence, and is practically self-supporting. Of the five buildings, all save one are in prime condition.

Lansingburg.—Accommodations are entirely inadequate. Not more than 1,000 pupils can be comfortably seated, while there are 3,131 persons of school age in the town. Thirteen hundred and five of these were enrolled in the schools during the year. The free text-book system was adopted at the last town meeting and has proved to be a complete success, facilitating school work and costing less than 45 cents per scholar.

Lyons has employed a special teacher for writing.

New York.—There are 305 schools under the supervision of the board of education, 6 of which were added during the year to provide for the increase of 4,299 in the number enrolled. The corps of teachers has been increased by 104, and the average attendance was 2,619 more than last year. Three new buildings have been completed, additions to the 3 others have been furnished and occupied, and 6 houses owned by private parties have been leased, all of which has increased the seating capacity by 8,115. Improvements have been made in the heating and ventilating apparatus as far as the funds apportioned would allow. In pursuance of the fixed policy of the board, the number of 2-department schools has been increased until now only 24 of the 83 grammar schools remain 3-department schools; a primary school, a male grammar, and a female grammar school being each designated a department. The examinations of the assistant superintendents show that of the 2,982 classes in the primary and grammar schools, the instruction in 2,376 is excellent, in 591 good, and in 15 fair. Of the principals whose management is recorded, 94 per cent. are graded excellent. In most of the schools the order

and discipline are especially satisfactory, and the punctuality of the pupils is highly commended. The subject of industrial training has occupied a large share of the attention of the board during the year; the committee on course of study and text-books has been directed to thoroughly investigate the subject and, with the aid of the city superintendent, examine the working of the system in the various cities of the country where it has been adopted, as well as in the cities of Europe.¹ The elements of geometry have been introduced in the highest grammar grades to give pupils an idea of the purely logical arrangement of thoughts and to equip them with a few facts that will assist them in the study of mensuration. The use of supplementary readers is becoming common; their proper use is favored. The subject of physiology and hygiene has received increased attention during the year and much permanent good has been accomplished. Vocal music is steadily gaining ground, both in proficiency in reading and executing music and in the improvement it is working in the perception of sounds. Some 9,193 pupils study German, and 2,029 are in the French classes, requiring for the two languages 29 special teachers. With the increasing excellence of the instruction in modern languages in the Normal College, and the requirement that the regular teachers must be proficient in music and drawing, the need of special teachers becomes constantly less. Indeed, it is already recommended that the specialists in the two last subjects be dispensed with altogether as such. The Normal College is growing in popularity, and the pressure for admission continues to increase. Seventy-five per cent. of its graduates have held positions in the city schools. The establishment of a reformatory school is needed for the proper enforcement of the compulsory education law, and is earnestly recommended. The evening schools continue to flourish; one-fourth of the pupils in attendance are foreigners studying the English language. Statistics of juvenile crime furnished by the records of the police department, before and after the passage of the compulsory education act, present a strong argument in favor of that measure. The number of offenses committed by persons between 8 and 14 has decreased nearly 50 per cent.

Newburg.—The opening of the new academy building vies with the introduction of manual training and the free text-book system for the honor of being the most important event of the year. The academy was opened with interesting ceremonies in September, 1886. With this important addition, the accommodations are more than sufficient for the accommodation of all pupils. There are now sixty-two rooms under the control of the board, and all are in good condition. Rooms have been fitted up and all necessary tools provided for instruction in carpentry. One hundred and fifteen boys, divided into ten sections, take one lesson each week, and are very enthusiastic. Sufficient time has not yet elapsed to judge the results. Though the free text-book plan has had as yet only an incomplete trial, it is clear that it teaches habits of care; one principal attributes the increase in attendance in his school directly to this cause. The abolishment of corporal punishment has not increased the number of mischievous children.

Rome.—Two additional teachers were employed this year, and these, with other extraordinary expenses, increased the total expenditures to more than \$1,700 more than last year. The arrangement of the buildings is faulty, and the accommodations they afford are inadequate.

Saratoga Springs.—Diphtheria and measles among the school children caused such a falling off in attendance during the winter that some of the schools were almost broken up. After a trial of six weeks the no-recess plan was adopted, and has been quite favorably received by teachers and pupils. The discipline of the schools continues to improve.

Seneca Falls.—A new school building has been erected, but the board claims that the terms of the contract were not fulfilled and refuses to accept it. A suit is now pending in the courts. The scientific apparatus, hitherto of little value, will soon be materially increased.

Syracuse.—The school system has been extended to take in seven additional schools in the suburbs and two primaries recently opened in remote parts of the city. One new building was opened during the year to replace the structure burned during 1885-86. The hygienic condition of the houses is not what it should be in the majority of instances. In only seven of the twenty-seven buildings are proper arrangements provided for heating and ventilation. The high school shows steady and decided improvement. The school library shows a net increase of nearly 800 volumes, and now numbers 18,062.

Troy.—Though no protracted interruptions have occurred like those of the two previous years, the progress and condition of the schools in 1886-87 can hardly be consid-

¹Since the publication of the report from which this information is obtained, the committee has rendered an exhaustive and valuable report, in which the subject is thoroughly reviewed, and the effects set forth. The committee estimates that the introduction of the system in all the schools would cost \$123,500 the first year and \$89,500 each succeeding year—this to include all the cost of instruction of all boys in the grammar and primary departments in carpenter work, of all girls in cooking and sewing, and of both sexes in modelling in clay, construction work in paper and paste-board, and drawing to scale. The committee favors the introduction of such training in all the schools. In October, 1887, the board decided to make the experiment in 6 schools before adopting the system for all.

ered entirely satisfactory. The school, law, and finance departments of the city government were not in accord, and the schools suffered. In the discussions that followed the stirring up of municipal affairs, the schools were subjected to much unjust criticism. The uncertainty concerning money matters during the winter also had a detrimental effect. In March the entire corps of teachers was dismissed, but was subsequently re-engaged. These events created unrest, and though all ended well, the school work of the year was not as satisfactory as it would have been without their occurrence. The growth of the schools is slow and hardly commensurate with the growth of the city. It is estimated that there are 2,000 children in the city under fourteen years who receive no instruction. The enrolment for the year has been 113 greater than last year, but 1,476 more days were lost by absence than in 1895-86. The accommodations are substantially the same as last year, the only addition reported being one hundred new sittings. The methods of work in drawing and in vocal music have been subjected to revision and improvement. In drawing a course has been adopted which looks wholly to the industrial features of the study while continuing all the advantages of the system formerly in use. Physiology in the grammar schools, and English literature and natural history in the high school have received increased attention.

Utica.—The schools show an average increase of 137 pupils per year for the last twenty years. The attendance also shows a constant and satisfactory improvement. The accommodations are not sufficient, and in too many cases the houses are ill adapted to the uses to which they are applied. The evening schools have been more than usually successful; good order has prevailed and excellent work has been accomplished. A special teacher was placed in charge of penmanship during the year, and the work done under her direction has been much more satisfactory than was ever obtained by the former method of instruction by the regular teachers.

Watertown.—The schools are in a prosperous condition, with an enrolment increased by 196 and the average attendance increased by 157 over last year. The number of cases of tardiness shows a considerable increase. The condition of the school property is generally good.

NORTH CAROLINA.

Raleigh.—The patronage of the schools has largely increased during the year. A new school building has been erected by private parties and leased by the school committee for a term of 20 years. The use of the rooms rented in the business portion of the city will be no longer necessary. Additional teachers have been employed, and the force is now sufficient for the instruction of all pupils enrolled. The attendance in the colored schools has also increased, and it has become necessary to employ assistant teachers for several of the grades. The discipline steadily improves and is now fairly good. A high school department is needed; the course at present covers but 9 years.

OHIO.

Alliance school facilities have been greatly improved during the last few years, and are at present in quite a satisfactory condition. The teachers are as a rule well qualified and faithful.

Ashland completed in time for use this year a handsome school-house whose total cost amounted to \$33,000.

Canton.—The event of the year was the dedication of a magnificent new high school building in April. Such a building had long been wanted, and when it was finally completed, elaborate ceremonies were arranged for its reception by the board and people. It covers nearly 15,000 square feet of ground, is 3 stories high, besides the basement and bell tower, and is believed to be one of the best warmed and ventilated buildings in the State. "Nothing was left undone to make it what it ought to be in every respect." The total cost was a few dollars less than \$100,000. The enrolment and attendance each shows an increase of 1 per cent. over last year. The number of cases of tardiness has decreased by 46. In the high school an English course has been established and pupils may choose between that and the regular course.

Chillicothe.—The school library contains over 10,000 volumes, and is supplied with standard periodicals, newspapers, etc. There are special German and writing departments.

Cincinnati.—The year just passed has been prolific in changes and improvements. Perhaps the most important of these regarded the appointment of teachers and the supervision of the schools. Until this year, "local trustees" nominated all teachers for the schools of each district, and were charged with certain supervisory duties. The plan recently inaugurated entirely abolishes these local committees, and places the appointment of teachers and the supervision of the schools under the direct control of the board of education. Another sweeping change was the abolishment of examinations as tests of fitness for promotion. According to the scheme now in use, pupils of the several grades are promoted primarily on their proficiency in the several branches, as shown by the

teachers' recorded estimates, duly approved by the principal. These estimates are made without the daily marking of recitations, and without the use of stated examinations. The course of study has also come in for its share of the alterations, and an entirely new course has been outlined for next year's work.

Columbus.—The work done in the construction of new buildings has not kept pace with the rapid increase in the population of the city. Several of the school-houses are now overcrowded for the first time in 16 years. The growth of the school library is gratifying. Arbor day was observed with elaborate ceremonies. The results of a thorough examination of the eyes of the pupils of the schools indicate that 22½ per cent. of all the children enrolled suffer some form of optical affection.

Dayton.—The finances of the board continue to be in excellent condition, and the prosperity of the schools is apparent and gratifying. The night schools have met with only a modicum of success, and their results are not such as to arouse enthusiasm. Drawing has been discontinued in the high school.

Lima.—Ground has been broken for a handsome building, which is expected to be the most commodious and best adapted to school uses in the city. Natural gas as fuel has been introduced in the school buildings, and its use, it is thought, will be a material advantage. The attendance during the year has not been up to the usual standard owing to the presence in the schools of a new element, which deems regular attendance a matter of minor importance.

Zanesville.—The high school course has been lengthened to four years.

OREGON.

Portland.—Four new rooms have been opened and four additional teachers employed. All the school buildings in the city were repainted and repaired during the year. An apparent decrease of 700 in the school population is explained by the defective methods of enumeration employed. The average number belonging was larger than in any preceding year. The plan of electing teachers annually has caused a great deal of dissension among the teachers, and undoubtedly impaired their work. It will probably be changed before the next year.

Salem.—One of the finest wooden school edifices in Oregon has just been completed here at a cost of \$50,000.

PENNSYLVANIA.

Beaver Falls adopted the "half-day session" plan for relieving overcrowding in primary grades this year. The plan was fairly successful and will be continued. Natural gas has been introduced as fuel, and the results are better heat and better ventilation than could ever be secured before.

Chambersburg.—The new course of study put in operation at the beginning of the year has been found to be well adapted to the needs of the schools. The work done was satisfactory as a whole—many defects of former years having been remedied or removed.

Harrisburg.—"The board of control has dispensed with music in the schools and ordered the same to be stricken from the course of study in all the grades."

Johnstown.—The schools suffered no serious hinderance to progress this year. The course of study has been rearranged for next year's work. At the fourth annual drawing exhibit at the end of the term there were displayed the most meritorious specimens yet exhibited.

Norristown.—The year has been a profitable one to the schools of this city. Six hundred and five admission tickets were issued to new scholars; a fact that shows a considerable change in the school population. A resolution has been passed to employ a special teacher for music.

New Castle.—A small paper is issued quarterly, under the direction of the superintendent, in the interest of the schools. Tardiness causes a great deal of trouble.

Philadelphia.—The results of the labors of the board of education for the past 10 years are becoming evident in the greatly improved and very satisfactory condition of the schools. Much of the progress made is accredited to the working of the system of superintendence inaugurated 4 years ago. Perhaps one of the most important tasks undertaken under this régime, was begun during the year just passed—that of securing uniformity of instruction in all the schools. The preparation of all examination papers in the office of the superintendent is expected to go far toward the accomplishment of this desirable object. A general increase of \$50 per annum in the salaries of teachers is another step which will undoubtedly lead to improved instruction; this may also be said of the adoption of the plan of increasing salaries in various departments upon the basis of term of service. A difference yet exists in the pay of instructors in the different departments, but it is probable that the time is close at hand when the rank of primary teachers will be equal to that of the secondary and grammar school teachers. Until recently the city has made annual appropriations for the support of kindergartens controlled by

a society of citizens, but within a few months the sub-primary schools have come under the direction of the board of education. They have been thoroughly reorganized, and a code of rules and regulations prepared that will effectually bring them into the city system. The instruction in sewing in the schools is believed to be more extensive and thoroughly organized than in any other city in the country; the results have been of the most gratifying character. The system of training in the Manual Training School is excellent; a new brick building, fitted up as a blacksmith shop and foundry, has been added to the facilities of the school during the year. Material changes have been made in the exercises of the Industrial Art School, which have resulted advantageously to the instruction and comfort of the pupils. The Girls' Normal School, which really includes a girls' high school with a 3 years' course, besides a post-graduate course of 1 year for professional training, is filled to its utmost capacity; 167 of its graduates were appointed to teachers' positions during the year. Marked improvement continues to be perceptible in the evening schools; the annual appropriations for their support have steadily increased from \$10,000 in 1880 to \$35,000 in 1886.

Shenandoah.—The new course of study prescribed for next year shows careful preparation and a judicious arrangement of studies. Considerable attention is paid to physical exercise.

South Bethlehem.—The schools have lately been re-graded. The free text-book system is favored and will probably be adopted during the next year.

West Chester.—A handsome building of 12 rooms has been erected during the year and will be ready for occupation at the beginning of next term. Arithmetic receives especial attention in the schools.

Wilkes-Barre.—A satisfactory reduction in the number of tardinesses is reported. Two new primary schools have been opened and several changes have been made in the lowest grades, the object being to equalize the number of pupils to each teacher and to secure better instruction. The general order of the schools is excellent. The high school is crippled and its work made less satisfactory by the lack of a sufficient number of teachers. Fire escapes have been erected for 3 of the buildings and a system of electric bells has been put in each of 3 others.

Williamsport reports the organization of 3 additional schools, in one of which the studies of the lower high school grades are taught. The accommodations are ample, but the location of some of the buildings is objectionable, and it may be necessary to build new houses soon on that account. The practice of holding elections in school-houses causes much annoyance, as the schools must be dismissed two days in each term for that reason. The attendance is good and the number of cases of tardiness has materially decreased. An alumni association was organized by the graduates of the high school, and annual meetings will be held in the future.

RHODE ISLAND.

Bristol.—The primary schools were badly crowded during the summer term, and in order to make room for new scholars coming in at the opening of the fall term, the highest primary grades of all the schools were placed in charge of teachers of the lowest intermediate grades, thus placing double work upon those teachers. This plan was not just to either teachers or pupils, but was the only remedy at hand. In December last a change was made in the high school course, making it simpler and more practical.

Cranston schools have suffered considerably from various causes during the year. Measles and other children's diseases have reduced the classes in some instances to a single individual. The residents of District No. 7 have erected a spacious and handsome school edifice, which will be occupied at the opening of the next term.

Cumberland.—Nearly \$400, received from the city and State for apparatus, was invested in books, maps, charts, etc. It appears that the buildings are not properly cared for, since two or three comparatively new ones are in such a condition as to be hardly habitable. A resolution has been passed to pay teachers monthly. Drawing has been introduced and teachers are preparing themselves to teach it.

East Providence.—Much inconvenience and trouble have resulted from want of school rooms, and resort has been necessary to temporarily rented rooms, which were not suited to school uses. Drawing has been introduced, and its study has awakened a great deal of interest in both teachers and pupils.

Johnston.—A high school was organized in September last, and was conducted for 30 weeks with an average attendance of 25. Its prospects are good for continued success, although in the absence of a well-defined course of study in the lower schools, it is quite difficult to prepare scholars for admission. Most of the buildings are old and by no means as good as should be furnished for school purposes.

Newport.—One of the old school-houses has been abandoned and sold, and its pupils were transferred to an elegant new building, whose use will also allow the reduction of the other schools to the proper size. A radical departure has been made in the matter

of school furniture by purchasing combined single desks and seats in all cases where new furniture has been required. More system will in future be observed in the employment and duties of janitors.

Pawtucket.—Substantial improvements in more than one respect have annually been reported for several years past, and the last is not an exception to the rule. Perhaps in the general increase of teachers' salaries appears the most important gain of the year; then, naturally following the improved work which must have been a result of such a measure, comes increased attendance and further expansion of school facilities. A new \$25,000 edifice and another house containing 4 rooms were opened for the admission of scholars at the beginning of the school year, and next term will see the completion of still another handsome building. A training school for teachers has been established and is expected to add much to the efficiency of the corps. The work in music and drawing has been systematized and better graded.

South Kingston schools do not appear to be worthy of the highest praise. The instructors are not all of that high professional character that the best interests of a school system demand, nor is the length of the school year sufficient for the accomplishment of the best results even under more favorable circumstances. A superintendent was employed during the year, but his labors were evidently not appreciated.

Westerly.—Commendable progress has been made during the year and the general condition of the schools is highly spoken of. A well-appointed primary school-house has been completed and improvements of a substantial character have been instituted in older buildings. Truancy is too common and steps are being taken to abate it. The abolishment of the district system and the establishment of an evening school are among the improvements recommended.

Woonsocket.—A proposition has been received from the conductor of one of the French parochial schools, offering to place his school under the supervision of the school committee for four hours daily. The superintendent thinks the acceptance by the town of this proposition would tend to improve the parochial schools, and sees no impropriety in endorsing it. The results of the evening schools are not entirely satisfactory, and means of improvement are being sought. The study of music under a special instructor was begun this year, and all are enthusiastic in its praise. The compulsory education law, with its provision concerning the employment of children, is not enforced universally in the State, and consequently in this town, where it is enforced, it operates unjustly to the schools and to the manufacturers. The latter are deprived of the child labor that those of adjacent towns get, and the schools are injured, because children can work in establishments close at hand, but outside of the jurisdiction of the truant officer.

SOUTH CAROLINA.

Columbia.—Constant improvement is being made in the schools from year to year. The attendance shows a considerable increase over last year, and the improvement in this respect would have been still greater had not lack of room obliged the superintendent to refuse admission to several applicants. The division of the lower grades into morning and afternoon sections resulted in the saving of \$1,000 without detriment to the instruction of the children.

TENNESSEE.

Chattanooga.—The schools are popular and prosperous; the percentage of enrolment to population is high. Two high schools are maintained, one for white and the other for colored pupils; sixteen graduates from these received diplomas last year.

Jackson.—The city authorities cordially co-operate with the board of education to make the schools successful. The session just closed was the best in the history of the system in enrolment, attendance, and in the general average of the pupils for proficiency. The age for the admission of children has been raised from six to seven years.

Memphis.—In school work this has been the most satisfactory since the advent of the present management. An examination of the eyes of the pupils of two schools has been made, revealing the fact that a large number of them suffer from eye-strain or near-sightedness. The proportion is much larger in the older building. Thirteen schools in the primary department were conducted on half time this session.

Nashville.—Comparison with previous years shows a considerable increase in the percentage of attendance, but the enrolment has not increased in corresponding ratio with the scholastic population of the city. For this, the presence of a large number of excellent private schools is mentioned as the probable reason. A school building capable of seating 1,000 pupils, handsome in design, and modern in all its appointments, was completed in September last. Another building similar to this in design and construction, though somewhat smaller, will be ready for occupancy at the coming session. The instruction in music, penmanship, and drawing is satisfactory and thorough.

Union City no longer requires an incidental fee from school children.

TEXAS.

Brenham.—The public schools have obtained such a hold that at the beginning of the year the German-American Union abandoned its private school, and rented the building to the board at a nominal rate. The legal school age of the city has been changed from six to sixteen to seven to seventeen.

El Paso.—From a beginning of 68 scholars in March, 1893, the public schools have rapidly grown in importance. A handsome \$20,000 building has been completed and furnishes excellent opportunities for successful school work. This building has been crowded this year, and at least two additional rooms are needed. It is said that the teachers are better paid than those of any other city in the State.

Fort Worth.—It is expected to introduce drawing and vocal music next year.

Galveston.—The condition of the public schools is entirely satisfactory. The first class to graduate from the high school received diplomas last June; it numbered twenty-two, all ladies but one. The proportionately small number of boys in the higher grades causes some solicitude.

Houston teachers are enthusiastic in their efforts for self-improvement, and take great interest in their meetings and their library. A new building was opened during the year.

Palestine school facilities are adequate for the accommodation of all the children in the city. Irregularity of attendance is still the greatest difficulty to be overcome.

Sherman.—The schools were opened in September as usual, but owing to the prevalence of dengue, regular work was not begun until November. Industrial drawing was made a regular study during the session, and the results obtained were such as to justify its continuance. The appointment of one of the teachers in each school as principal has provided the local supervision necessary to make each school a complete organization in itself.

Waco.—The year has been characterized by the rapid growth and improvement of the schools. The organization, discipline, and instruction are better with each succeeding year. An increase is noted in enumeration of 15 per cent., in enrolment of 13 per cent., in regularity of attendance of 3 per cent., and in the value of school property of 100 per cent. A large sum of money has been expended for new buildings. Roomy additions are nearly complete to two of the houses, and the fine central high school building, begun a year ago, will be ready for occupation at the opening of next session. The first class graduated from the high school last June, and was the occasion of much congratulation. A literary society was organized during the year and already finds great favor.

VERMONT.

Bennington.—Antagonism to the graded school system is fast disappearing and little opposition to the schools now exists. The character of the instruction is generally satisfactory, and the schools are in good condition. Unnecessary absences and truancy reduce the average attendance at least 12 per cent. The course of study for all the schools has been carefully revised. In the high school more attention will be paid to the English language; a general course of three years and a business course of two years are innovations. Vocal music was introduced in all grades.

Rutland.—An additional building to cost \$12,000 is soon to be erected, and by its architectural beauty will be an ornament to the town. The course of study has been systematically revised. Important among the changes introduced are the study of music in all grades and of drawing in the primary department, and the extension of the grammar school course by one year. Public interest in educational matters has greatly increased recently.

VIRGINIA.

Richmond.—Three new buildings were begun during 1885-86, and it was expected to complete them during the year just passed.

Staunton.—The public schools are well organized and thoroughly graded. The system comprises primary, grammar, and high schools.

WISCONSIN.

Baraboo.—There are seats in the three substantial school-houses for 1,000 pupils. A small library has been established. The scholars of the high school publish a monthly paper devoted to the interests of the schools.

Berlin offers instruction covering 14 years, of which the first is to be devoted to kindergarten and preliminary work before entering the primary school. Text-books are owned by the city, and may be rented by pupils for a year or term at moderate prices.

Green Bay.—The adoption of the free text-book system is being considered. The evening school established 1885, and so successful that year, was but poorly attended

during the past winter. A committee of 14 citizens has been requested by the board of education to inspect the schools during the next year.

Janesville.—A steady growth is perceptible in attendance, though but 52 per cent. of the school population attend any school, public or private. A library of 164 volumes was provided by the board during the year. Preparation has been made for the erection of a two-story steam-heated building of 6 rooms. The cases of tardiness and corporal punishment were much fewer than in the previous year.

La Crosse.—The schools have been so economically administered this year that the cost per pupil was less than it has been for the last ten years. The experience of another year adds to the popularity of the free text-book system, no objection whatever being urged against it.

Manitowoc.—A course of study has been prepared and adopted, and will be used from the beginning of the next term.

Neenah buys all school books and sells them at cost to those pupils who are able to buy them, and furnishes them gratis to those who cannot afford to pay for them. This system has been in operation for seven years, and gives entire satisfaction, no change being considered advisable. The year has been marked by good, healthy progress.

Oshkosh schools are not as perfect in their organization as they should be; to the defective method of supervision is laid the blame for the shortcomings of the system in this respect. The rule relating to promotions has been altered, so that the standing of the pupils in "weekly oral reviews" is of as much importance as the percentages obtained in the final examinations. Night schools were in session 4 months during the winter, with an enrolment of 80 and an average attendance of 60; \$1 per month was charged each scholar. Supplementary reading receives considerable attention. A reference library has been established for the high school. A new building, representing a cost of \$20,000, was completed and occupied in September last; it contains approved appliances for supplying heat, pure air, etc. Excepting in this building, the methods of heating and ventilation are at best of questionable utility.

Racine reports the enrolment decreased by 43—caused by the opening of a parish school in the vicinity of one of the city schools—and an increase of 44 in the average attendance. The city limits have been extended and a new school opened; the employment of two or three more teachers will therefore be necessary. Salaries have not been sufficient to hold several experienced teachers. A new building has been provided for, and advertisements have been inserted in the local papers inviting bids upon it. The school discipline has been in general effective and praiseworthy.

THE TABLE OF COMPARATIVE STATISTICS OF CITIES.

[Table 19, Page 274.]

The following table, introduced in this Report for the first time, is intended to present, in the most available form for comparison, the statistics of the 518 cities and towns that have forwarded returns to this Bureau. The plan of its preparation is similar to that adopted in the table of comparative statistics of State school systems in the Report for the year 1885-86. The population of each city between the ages of 6 and 14 is taken as the principal basis for the calculations concerning that city. It is to be regretted that so many cities, especially in the States of Louisiana, Maryland, Minnesota, and Pennsylvania, cause no school census to be taken; for unless the number of children of legal school age be known, it is not possible to compute with accuracy this all-important factor for comparison.

In the main, the columns comprise averages and ratios that have been frequently utilized before in school statistics, and the methods of calculating may be readily understood. Column 6, however, may have an unfamiliar appearance, and may require some explanation, as it has not been previously used. The figures there shown were obtained by dividing the "total attendance in days" of each city by the corresponding "population 6 to 14." The result forms a uniform basis upon which the amount of instruction given in all cities for which it is recorded may be compared. It shows the number of days all persons between 6 and 14 years of age in each city may have attended the schools, had their benefits been conferred upon such persons only. In importance this column must be ranked even above that showing the "ratio of average attendance to population," for while the latter is an excellent test of the quality of the instruction imparted, it is powerless to show the quantity. The schools of a city may have been in session for only 80 days, and during that time may have maintained a high ratio of attendance. Yet, it would be manifestly wrong to rate the educational work done by such a city above that accomplished by another whose schools were in session for twice as many days, even

if the percentage of attendance in the latter be somewhat smaller than in the former case. In indicating, then, both the length of the school year and the attractiveness of the teaching, the value of Column 6 is apparent.

To show what proportion of the sittings needed by a system of schools is actually provided, is a task of much difficulty. The number of sittings to each 100 pupils enrolled, and the number to each 100 pupils in average attendance, are shown, as being nearer to the desired result than any other ratio available. It is not generally necessary that there should be as many sittings as there are pupils enrolled during the entire year, but it is essential that there should be a seat for every child who actually belongs to the schools at any one time, and naturally there should be more sittings than there are pupils in actual attendance. Then, when it is remembered that it is beyond the limits of possibility to always adjust the size of the classes and the capacity of the rooms with such nicety that there will be no surplus of either pupils or desks at any point, the importance of having a much larger number of seats than the number of children in average attendance will be further emphasized. While the figures presented do not afford a satisfactory answer to the question as to the adequacy of the school accommodations of a city, they are amply sufficient for purposes of comparison.

It cannot be accepted as a rule that the instruction is best in those cities in which the "number of pupils in average attendance to each teacher" is smallest; yet, there is a point in the size of classes beyond which it is not well to venture. It may be safely asserted that when the average for a full-fledged system of schools, embracing grammar grades and high schools, rises above 50 pupils to each teacher, the children lose, in the character of the instruction they receive, much more than the city's treasury gains in the saving effected. From the nature of things, 50 pupils in average attendance per teacher for a school system generally means about 65 children in average attendance to each teacher in the primary grades; and 65 children in average attendance generally means the frequent attendance of fully 80 young children upon the instruction of a single teacher. It is not believed that any teacher, however efficient, can do full justice to this number of children.

In view of the frequently expressed demand for a larger proportion of male teachers in the schools, Column 11 is of considerable value. It will be observed that as a rule the proportion of males is larger in cities of moderate and small size than in the largest cities. The reason for this is obvious. Male teachers form 3.6 per cent. of the entire force in Philadelphia; 4.2 per cent. in Chicago and Brooklyn; 5.8 per cent. in New York; 5.9 per cent. in New Orleans; 7.5 per cent. in San Francisco; 11.9 per cent. in Baltimore; 16.6 per cent. in Cincinnati. The percentage in a number of the smaller cities is above 30. In Baton Rouge, La., it rises to 42.9; in South Easton, Pa., to 44.5; in Union City, Tenn., to 46.2.

It is well to consider Column 16 in connection with those which follow. The wealth of a corporation must be known in order that the schools it supports may be fairly judged. A difficulty arises in this connection, however, which it is not easy to overcome. The methods of assessment employed vary greatly. In some cities, property is assessed at its full value, while in others the assessed valuation is not more than one-tenth the actual cash value. With such differences to contend with, it is apparent that comparisons involving this quantity must be made with caution, especially when the cities compared are of different States.

Columns 20 and 21 indicate the direct cost to any city of its schools, per capita of scholastic population and average attendance. Column 22 shows, practically, the city tax rate for the schools, the costs of collection not being considered.

TABLE 19, PART I.—Comparative statistics of city public school systems for 1886-87; computed from returns made to the United States Bureau of Education.

	City or town.	Ratio of enrolment to population 6-14.	Ratio of average daily attendance to—		Average number of days attendance of each person enrolled.	Equivalent to attendance of each person between 6 and 14 for—	Number of sittings for study to—		Average number of sittings to a building.
			Population 6-14.	Enrolment.			Each 100 pupils enrolled.	Each 100 pupils in average attendance.

THE SUMMARY, BY STATES AND DIVISIONS, OF COMPARATIVE STATISTICS OF CITIES

[Table 20, Page 305.]

The difficulties and uncertainties that have surrounded the preparation in past years of the summaries, by States and divisions, of the school statistics of cities, have led to a radical change in the method of presenting them. It has not yet been possible to procure returns from all the cities on the lists of the Office. Of 690 blank forms sent to as many different cities, 518 were returned with statistics available for the Report; 162 cities and towns were not heard from, though the efforts of the Bureau were four times repeated; ten of the returns received were rejected, as the information they contained did not properly concern any city system. It will be seen that nearly all the States are represented in the list of cities that furnished no statistics. Under such circumstances it is plain that no summary of absolute quantities could be prepared that would not do injustice to the State for which it is made. The "number of children enrolled" in 75 per cent. of the cities and towns of a State cannot, by any process now known to this Office, be made to represent the "number of children enrolled in the public schools of the cities" of that State, without bearing on its face a palpable error. Any summarized statement of totals concerning any number of cities, not the whole number in any State or division, would be for all practical purposes meaningless.

For these reasons it has been decided to abandon the use of totals in the summaries of city statistics and present, instead, summaries comprising the same averages and ratios as are shown in the foregoing table. These are believed to be approximately correct, upon the hypothesis that the averages shown by any number of cities under substantially similar conditions will not materially differ from those shown by three-fourths of that number. The statistics of the States are presented in a previous chapter, and furnish all information ordinarily desired as to totals.

In the table it has been necessary to leave a number of the columns blank, for the reason that the items necessary for the computation were not reported by a sufficient number of cities to make an equitable average for the State. Two States—Florida and Vermont—are entirely without representation. Of the three cities in the former, the return of but one was available for use; and from the latter State, with seven cities and towns on the list, only two returns that could be considered satisfactory were received.

In instituting comparisons between the States as represented by the cities, it appears that Massachusetts leads in two important respects: the average attendance is equal to 92.8 per cent. of the population between 6 and 14, and the total amount of instruction imparted is equivalent to the attendance of the population 6 to 14 for 179.9 days. The same State excels in the amount (\$20.75) appropriated for schools by the cities and towns per capita of population 6 to 14, and is second only to Colorado in the amount paid for supervision and teaching, upon the same basis. New York, with 149.8 per cent., heads the list in the ratio of total public and private school enrolment to the established basis, being 7.6 per cent. ahead of Massachusetts. The proportion of enrolment to the population 6 to 14 is remarkably large in Colorado, reaching 138.4 per cent.; the value of school property and the amount paid to superintendents and teachers are also unusually large per capita. The children enrolled in the cities of Georgia are most regular in their attendance, 82 per cent. of them, on an average, being present every day; 163.7 represents the average number of days of each pupil's attendance. Ohio has the largest number of sittings in proportion to enrolment, but Colorado again leads if the number be compared with the average attendance. The average number of sittings to a building is greatest in South Carolina and least in New Hampshire. The cities of Michigan are best supplied with libraries, there being 313.7 volumes to each 100 pupils in average attendance. The percentage of male teachers to the whole number of teachers is largest in Alabama. The number of pupils in average attendance to each teacher is largest in South Carolina and smallest in Minnesota. Michigan and New Hampshire share the distinction of having proportionally the largest high school enrolment, with the advantage slightly in favor of the former.

TABLE 20, PART I.—Summary of comparative school statistics of cities, by States and geographical divisions.

State.	Ratio of enrolment to population 6-14.	Ratio of average daily attendance to—		Average number of days' attendance of each pupil enrolled.	Equivalent to attendance of each person between 6 and 14 for—	Number of sittings for study to—		Average number of sittings to a building.
		Population 6-14.	Enrolment.			Each 100 pupils enrolled.	Each 100 pupils in average attendance.

THE SUMMARY BY CLASSES.

[Table 21, Page 309.]

It appears from the figures of the following summary that if there is any advantage on the side of any class of cities, that advantage lies on the side of those whose population is less than 10,000. In only two cases is there a marked gradation, but it will be noted that in some of the most important columns the superiority of the small city from an educational stand-point is manifest. The ratio of enrolment to the population between 6 and 14, the amount of instruction imparted in proportion to the scholastic population, the average length of school life as shown by the number enrolled in high schools, the ratio of total public and private school enrolment to population, and the proportional value of school property, may be mentioned as matters in which the cities of Class 6 excel those of the other classes. The statement that these advantages are due chiefly to the size of the cities would not be borne out by the statistics, for, if such an assertion were true, it would be expected to find a gradual increase in every important column. Instead of this, it is shown that in the largest cities—those of Class 1—the averages attained are, in at least two important instances, more favorable than those of the other classes, and in the ratio of enrolment to population, and in the proportional amount of instruction furnished, the largest cities rank next to the smallest.

Column 7 plainly indicates that as the size of a city increases, the chances of the average child for a long school life diminish. To attempt to discuss the reasons for this fact would be to open a question concerning the social conditions of cities which it is not within the province of this Report to settle. It is evident, however, that it is not due to any failure on the part of the authorities of the larger cities to provide liberally for the schools, since it is proved by Column 14 that the proportional amount paid for supervision and teaching increases with the population, though not in regular progression.

The amounts apportioned to the schools are generally larger per pupil in average attendance in the large than in the small cities; and since the value of school property is greater per pupil in the smaller cities, it may be inferred that the authorities in the great cities prefer to devote the funds at their disposal to the improvement of the character of the instruction, rather than to the acquirement of property, and that in the cities of lesser population the tendency is in the other direction. It can only be a matter of conjecture to what extent these conclusions are affected by the well-known facts that the difference in the cost of living makes it possible to secure good teachers at lower salaries in the less populous cities, and that the more crowded condition of the large cities renders practicable the use of larger and therefore less expensive buildings.

So few of the cities concerned reported the items required for the calculations that Column 9 for Class 1, and Columns 8 and 9 for Class 2, could not be filled. It appears, however, that private schools are patronized least in the towns and smaller cities, and that the total enrolment steadily increases from Class 3 to Class 6.

TABLE 21.—Summary of comparative school statistics of cities, by classes, according to population.

	Ratio of enrolment to population 6 to 14.	Ratio of average attendance to enrolment.	Average number of days' attendance of each pupil enrolled.	Equivalent to attendance of each person between 6 and 14 for—	Number of pupils in average attendance to each teacher.	Ratio of high school enrolment to total public school enrolment.
1	2	3	4	5	6	7
	<i>Per ct.</i>	<i>Per ct.</i>	<i>Days.</i>	<i>Days.</i>		<i>Per ct.</i>
Cities of first class (population 200,000 and upwards)	98.0	73.2	145.1	132.4	40.6	2.5
Cities of second class (population 100,000 to 200,000)	74.5	71.3	139.0	103.2	38.6	2.8
Cities of third class (population 50,000 to 100,000)	89.3	69.0	133.6	119.0	36.0	4.6
Cities of fourth class (population 25,000 to 50,000)	86.3	71.0	136.6	116.4	35.3	5.1
Cities of fifth class (population 10,000 to 25,000)	94.3	70.2	138.2	129.8	36.5	5.3
Cities of sixth class (population under 10,000)	102.7	62.9	140.3	111.3	36.5	7.1

	Ratio of private school enrolment to total public and private school enrolment.	Ratio of total public and private school enrolment to population 6 to 14.	Value of school property per pupil (based on average attendance).	Ratio of value of school property to total assessed valuation.	Amount raised by city or town tax per pupil (based on average attendance).	Ratio of amount raised by city or town tax to total assessed valuation.	Salaries of superintendents and teachers per pupil (based on average attendance).

THE STATISTICS OF CITY SCHOOLS.

[Table 22, Page 312.]

The arrangement of the table of absolute statistics in this Report differs in no material respect from that of the Report of 1885-86. Those columns that were of the nature of ratios have been eliminated from this table, but may be found by reference to Table 19, where they are presented with other statistical facts of like kind. Experience has proved that it is more satisfactory in every respect to make the computations necessary for obtaining these ratios in this Office, rather than to ask the voluntary correspondents of the Bureau to furnish deductions that can be made here with equal accuracy and greater uniformity.

The following table represents information received directly from the school officers mentioned in connection with the statistics of each city. An exception to this statement must be made, however, so far as Columns 5 and 6 are concerned. In but few cities does the school census taken show the population between 6 and 14 or that between 4 and 21, and estimates of these items are necessary. The figures presented are the results of calculations based upon the proportion which the population between the required ages has been shown by previous censuses to bear to the school population of any city or State. The estimates calculated in this way are probably as nearly correct as can be obtained without an actual enumeration, and are certainly more accurate than any conjecture could be under the circumstances that ordinarily surround the school officers of large cities.

In the matter of enrolment there is practical uniformity of method in all the cities, and little fault can be found with the columns devoted to that subject. Wherever there is any organization worthy of the name, a good account is kept of the pupils enrolled. This item is, therefore, of all those required by the table, the most easily obtained and the most satisfactorily reported. The only trouble experienced in this connection has been with those cities which support evening and special schools, for in a number of such instances it has been difficult to determine whether the reported "whole number enrolled" included the enrolment in the special schools.

Improvement is noticeable in the columns relating to attendance; the attendance records of nearly all the cities are now kept in accordance with essentially the same plan. The evening and special schools are sometimes elements of uncertainty in this connection also. Though it is manifestly wrong to add two quantities so entirely dissimilar as the average attendance in evening schools and the average daily attendance in the day schools, this is often done and the result is called "total average daily attendance." The records and statistics of evening schools should be kept entirely separate from those of the day schools, as long as there is as much difference in the character of the two branches of educational work as at present. Evening schools are not usually in session more than 60 evenings, nor more than 3 hours each evening, while the day schools are generally open between 180 and 200 days for 6 or 7 hours each day. When such wide differences in the value of the two quantities are considered, the impossibility of combining them upon equal terms is apparent, and in all cases where it was evident that the records of evening schools had contributed to increase the "average daily attendance," the proper diminution was made from the latter before the calculations for Table 19 were made.

In Column 18 there are indications that many different methods of arriving at the "total attendance in days of all pupils" exist. Properly, it should be identical with the product of the average daily attendance multiplied by the number of days the schools were taught. In the manner of dealing with half-day and quarter-day absences is the disparity which explains the failure, in a number of instances, of the "total attendance in days" to coincide exactly with the product mentioned. Presence at the morning roll-call is considered by many superintendents, in summing up the total attendance for the year, to be a day's attendance, while in calculating the average daily attendance it occasionally happens that the same officers are so precise as to deduct the time lost by tardiness as well as the longer absences. The reverse of this is sometimes true, and precision regarding the total attendance is exercised, while presence for a part of the day only is equivalent to a day in reckoning the average daily attendance. This diversity of method will account for many of the seeming discrepancies that the careful observer may detect in this column. To be strictly accurate only actual presence in the schools should be considered in compiling the records of attendance. The value of all school statistics would be enhanced if this rule were universally observed.

Column 26, "number of teachers necessary to supply the schools," is an innovation whose value would have been greater had there not been some uncertainty in the minds of a large number of superintendents whose reports were received, as to the meaning of the inquiry as it appeared in the blank forms. Nevertheless, a sufficient number replied to the question to make the column one of considerable importance. It will be seen that in connection with the "whole number of teachers in all public

schools," this quantity should indicate the number of changes in the teaching force of any city during the year under consideration, in addition to its primary purpose of showing the number of teachers' places provided. That this double object is secured in only a comparatively small number of cases is due to a cause that will, of course, speedily disappear.

Certain correspondents have been doubtful as to the proper treatment of rented rooms and buildings in replying to the question for Column 27. The combinations of circumstances that arise are so numerous that it is difficult to form a rule that will be satisfactory for universal application; but generally, all buildings, rented or otherwise, that contain independent schools should be counted. When only 1, 2, or even 3 rooms are rented or built merely to accommodate the "overflow" from an adjacent school-house, it would hardly be proper to consider the "annex" as an additional building. The "number of buildings" is of value in that it tends to show the policy pursued by any city in the erection of school-houses, for it is by no means settled whether large or small buildings are most advantageous. If this principal object of the inquiry be remembered, superintendents will probably have but little difficulty in the exercise of their discretion, when the correct reply is involved in doubt.

The systems employed in keeping the accounts of receipts and expenditures are nearly as numerous as the cities themselves, and it was with the columns pertaining to finances that the greatest difficulties experienced in the preparation of this table were encountered. The methods of book-keeping of all the cities doubtless accord with local usages and needs, but for purposes of comparison with other school organizations many of the systems used are woefully deficient, for the reason that they fail to take into account many of the items that are generally considered essential. The facts set forth in the accompanying table are commended to school officers as having been found by the foremost educators of the country to be of prime importance, and easily obtainable. Other items are often necessary to supply local wants, and in the larger cities further subdivision is desirable, but it is infrequent that circumstances occur to render objectionable a classification similar to that of this table.

The attention of superintendents has been often drawn to the importance of uniformity in this respect, and the improvement resulting has been constant and gratifying, but much still remains to be done before comparisons, satisfactory in every particular, can be instituted between any and all the cities in the country.

CHAPTER VI.

TRAINING OF TEACHERS.

General recognition of the importance of normal training—Normal schools—Courses of study in State normal schools—City training schools—Model schools—Physical and manual training at normal schools—Teachers' institutes—Teachers' reading circles—Summer schools for teachers—Present condition of normal training (by States)—Remarks upon the tables—General summary, showing teaching force, where educated, teachers' certificates, etc. (Table 23)—Statistics of teachers' institutes (Table 24)—Summary of statistics of normal schools (Table 25)—Statistics of public normal schools (Table 26).

GENERAL RECOGNITION OF THE IMPORTANCE OF NORMAL TRAINING.

In a review of the work for the professional training of teachers during the past year the conclusion is unavoidable that it has been one of marked advance and effectiveness. From all quarters come encouraging reports of increased interest and intelligent zeal in the line of the teacher's profession; and the larger appropriations, the thorough repair and enlargement of existing institutions and appliances, the establishment of new schools upon most liberal and approved patterns, the eager crowds of students seeking admission, as well as the growing demand on the part of the public for better and professionally trained teachers, indicate that pedagogy, as a profession, is beginning to receive the consideration due its usefulness and its prime importance. The pivotal question, after all, in discussing this subject, is the question of the teacher: "this question of learning, skill, and personal power in the teacher is really that before which all others pale; and when it is fully settled, the knowledge which is of most value will find its way into the schools and the minds of the people as easily and naturally as the sunshine finds its way into every nook of the landscape." Courses of study and methods of instruction lead quickly to the question, "Who are to do the teaching and the supervising?" Like other instruments of vast power, the public school system may be greatly abused, and whether it is or not will depend mainly on the intelligence, education, and devotion of teachers and supervisors. The teacher makes the school. If the teacher be abundantly competent, the school is abounding good. No improved text, no new apparatus, no Pestalozzian methods, no frequent examinations, no careful supervision, can take the place of the teacher; and in all discussion of the subject it is needful to bear this truth in mind.¹

NORMAL SCHOOLS.

Among the most generally approved appliances and methods in vogue for the furtherance of this great end—the professional training of teachers—first in point of efficiency and value are the public normal schools. Much has been said, pro and con, by educators and the public in general regarding the true province and importance of these schools. It is now no longer a question, however, as to the necessity of the normal school to the well-being of a system of State public schools. Nearly all the States now recognize this fact, and in some of the older Commonwealths liberal support is given to from two to eleven of these institutions. It is considered bad economy to expend millions for the support of common schools, and then leave the instruction of the children of the State in unskilled hands. Scholarship, although of primary importance, is no longer deemed a sufficient qualification. There are laws underlying the art of instruction and the science of teaching, the recognition and application of which are as necessary to successful practice as in the case of any other occupation.² Perhaps the most convincing proof of the estimation in which these schools are held is the fact of the large and increasing appropriations of money made for their support in those States where they have had a thorough trial. Experience has proved that a normal school under the care and direction of the State is a necessary part of a State educational system; that good schools cannot be had without properly trained

¹ City superintendent of public schools, Columbus, Ga.

² Nebraska State Report.

teachers, and to supply these no agency has been found so efficient as properly conducted normal schools where education is taught as a science and teaching as a high art.¹

Three new public schools are reported to this Bureau as having been established during the past year. The Territorial Normal School at Tempe, Ariz., owns grounds, buildings, and apparatus valued at \$10,000, and received a Territorial appropriation of \$5,000. During its first session there were enrolled 53 students and 5 normal graduates, taught by 1 professor. The State Normal School at Clarion, Pa., was organized in the spring of 1887 with 10 professors and 147 students. This institution received a State appropriation of \$30,000, and is valued at \$100,000. The Winthrop Training School at Columbia, S. C., owes its origin to the liberality of the Peabody fund, having received for the purpose a donation of \$1,500. One student from each county of the State is received free of charge for tuition, which gives it the semblance of a State school. Besides these new schools, enlargements and repairs are reported from many of the older institutions. A notable example is that of Pennsylvania, in which State ten out of eleven State normal schools have received important improvements and additions in the matter of buildings, etc. The Indiana Normal College, an institution under private auspices, has been established at Covington, Ind., and reports 10 professors, 105 students, and 10 normal graduates during the year.

Three States will report additional normal schools next year. California is building one at Chico, in the northern part of the State; Alabama is adding another at Troy; and Florida reports provision for a normal school at De Funiak Springs. Legislative provision has been made for one also at Oneonta, N. Y., and one for colored teachers in Kentucky. Nebraska and other States need more schools, besides those already established; Michigan must provide increased accommodations for the students of that State desiring professional training; Nevada asks that its university be conducted for the present as a State normal school; while North Carolina and South Carolina are persistently demanding a normal school in their respective States for the education of white teachers. The demand for professionally trained teachers is still largely in excess of the supply. In some States the need of competent teachers is so urgent that many pupils remain only one year at the normal school before assuming the responsibilities of the profession.

COURSE OF STUDY.

In regard to the course of study in the State normal schools, the standard in many instances is being gradually raised. The tendency is to abolish preparatory departments, and to make the schools more strictly professional in character as fast as the higher grammar grades and the high schools can supply properly qualified candidates. In many of the schools there are two courses of study: an elementary—usually of 2 years—for the preparation of teachers for the primary and lower grades of the common schools, and a higher course of 1 or 2 years additional to qualify teachers for positions in the grammar and high school grades. Satisfactory examination in the common school branches is the ordinary qualification for admission as regards scholarship. The age of eligibility ranges from fifteen years and over, though in a few cases, as at the Philadelphia Normal School for Girls, the limit is brought down to fourteen years. Tuition is mostly free to normal students, who are required to pledge themselves to teach after graduation. Text-books are furnished at some schools, and expenses of board, fees, and incidentals are brought down to a low figure at all the schools. Diplomas are awarded at these institutions, and are recognized in many States as first-grade certificates, obviating the necessity of further examination.

No common pattern for all normal schools can be established, for they have at all times and in all places accommodated themselves to circumstances, teaching their pupils what they needed as teachers. These schools are created by authority of the different States, and to the scope and plan of organization prescribed by law they must conform. In the summary, by States and Territories, of the normal training provided for teachers will be found an indication of the need of each section and the provision being made to supply it. The courses of study at representative schools of the East, South, and West are herewith given.

Courses of study.—Pennsylvania State normal schools.

The normal school law of Pennsylvania provides for three distinct courses of study: the elementary course, the scientific course, and the classical course.

The studies of the elementary and scientific courses may be classified as follows:²

ELEMENTARY COURSE.

1. LANGUAGE.—Orthography; reading and elocution; English grammar; composition; outlines of rhetoric and English classics; elements of Latin (Cæsar, Helvetian war).

¹ Catalogue of State Normal School, Monmouth, Oreg.

² Catalogue of State Normal School, Millersville, Pa., 1886-87.

2. MATHEMATICS.—Mental arithmetic; written arithmetic; algebra; geometry.
3. NATURAL SCIENCE.—Political geography; elements of mathematical and physical geography; physiology; natural philosophy; botany.
4. HISTORY.—History of the United States; Constitution of the United States.
5. THE ARTS.—Penmanship; drawing; vocal music; book-keeping.
6. TEACHING.—School economy; methods of instruction; mental science and methods of culture; history of education; practice of teaching.

SCIENTIFIC COURSE.

This includes the studies of the elementary course and the following branches:

1. LANGUAGE.—Rhetoric; English composition; English literature; analysis of English classics; Latin (six books of Virgil, four orations of Cicero, and the Germania of Tacitus).
2. MATHEMATICS.—Higher algebra; trigonometry and surveying; analytical geometry; differential and integral calculus.
3. NATURAL SCIENCE.—Geology; chemistry; zoölogy; optics; acoustics; electricity and galvanism; analytical mechanics; astronomy.
4. HISTORY.—General history.
5. ARTS.—Higher culture in vocal and instrumental music (voluntary).
6. TEACHING.—Mental philosophy; moral philosophy; logic; lectures on the history of education and the philosophy of education.

CLASSICAL COURSE.

This course includes the studies of the elementary and scientific courses and the usual collegiate course in Latin and Greek.

Course of instruction.—Nashville (Tenn.) Normal College.

First year.—Primary and grammar school studies, with reference to teaching them, viz: Arithmetic, oral and written; algebra; geography, civil and physical, with map drawing; English grammar and analysis; history of the United States; physiology and hygiene; rhetoric; etymology; book-keeping; free-hand drawing.

Second year.—Geometry; plane trigonometry; geology; zoölogy; botany; general history; moral science; Latin; perspective drawing.

Third year.—Spherical geometry and trigonometry; astronomy; chemistry, with work in laboratory; physics; English literature; history and Constitution of the United States, with civil government; Latin; psychology.

BACCALAUREATE CLASS.

No students are admitted to this class who have not taken the regular senior class studies, etc., at this college.

Fourth year.—Conic sections, considered geometrically; analytical geometry, calculus, English literature, Latin, German, psychology, model drawing, designing, etc.

Such changes are made in the course from time to time as circumstances require. No student is allowed to take a higher study until that which precedes it in the course has been mastered.

The Latin and German languages are taken according to a parallel course, and are taught by the most approved modern methods. Drawing with black-board delineations, English composition, declamation, reading, spelling, defining, penmanship, vocal music, etc., and practice in teaching, receive attention throughout the year.

Course of instruction.—California State Normal School, San José, Cal.

Junior year.

LANGUAGE.....	English grammar..... Spelling.....	English grammar. Spelling.

	Lectures on methods of teaching	Lectures on methods of teaching.

CITY TRAINING SCHOOLS.

In all the large cities the problem of supplying the schools with well qualified teachers is one of pressing importance. The State normal schools, many of which have borne an honorable part in the educational progress of the last twenty years, are utterly inadequate to furnish teachers for all the schools. This fact, and the wish to give a systematic and homogeneous character to the instruction, have induced most of the large cities to establish normal schools or training classes to supply their own schools with teachers. These two classes of normal schools act in perfect harmony, and, under somewhat different conditions, labor for the same ends.¹

While the State normal schools are generally co-educational, the city training schools are usually for young ladies exclusively; and as the professional course is seldom more than a year in length, the scholarship required for admission is higher, usually equivalent to that of high school graduates.

Mr. S. A. Ellis, city superintendent of public schools at Rochester, N. Y., has kindly furnished this Bureau with a statement of the plan of the normal training class of that city, an outline of which is here given:

(1) *Condition of entrance.*—Each applicant for membership must be eighteen years of age, and must have received at least three years of academic training.

(2) *Time.*—The course embraces the forty weeks of the school year. The class meets for one hour each week to discuss the topic assigned the previous week.

(3) *Subjects.*—The subjects studied are—

(a) Education.

(b) Teachers' qualifications.

(c) School organization, management, and discipline.

(d) Duties of teachers in reference to the physical, moral, and intellectual well-being of pupils.

(e) History of pedagogy.

(f) Psychology—its practical application to the work of teaching.

(g) Mental philosophy in its application to the work of teaching.

(h) Methods of teaching the various school branches.

(i) Moral training.

(4) *Method of study.*—Questions upon each topic are arranged, printed, and distributed to the class a week or more previous to the discussion of that topic. Mem-

¹ Report of City Superintendent, Minneapolis, Minn.

bers of the class are required to prepare for the discussion by the study of the books of any good author, by personal observation, by conversation with those who have given attention to the subject, and by their own thinking and reasoning.

(5) *Programme of weekly meeting:*

(a) Roll call.

(b) Literary quotations from six or eight members of the class, these having been previously appointed for the purpose.

(c) Reading of the minutes of the previous meeting by any one upon whom the leader may call, and additions and corrections.

(d) The leader calls upon members of the class in turn (using cards) to answer and discuss the questions in the printed list, opportunity being given for voluntary remarks or questions upon each topic thus discussed.

(6) *Reference library.*—Books of leading authors upon all subjects in the course of study, from a reference library for the special use of training class.

(7) *Examination certificates.*—A second-grade certificate is given to each member of the class who passes successfully the examination given at the close of the year's work, which is good for one year of teaching. At the expiration of that time, all who shall have demonstrated their ability to manage and instruct a class of pupils receive first-grade certificates, which entitle them to teach in any position in the public schools below the high school, except as principal.

(8) *Practice.*—All substitutes and temporary assistants are taken from the training class, as well as nearly all appointments to permanent positions.

MODEL SCHOOLS.

The value of practice schools has often been the subject of discussion. At the present time, however, all authorities are well nigh unanimous in recognizing the usefulness and necessity of practice schools, or some other provision for actual school-room work for young teachers, before they enter upon the work independently. As a matter of fact, provision of some kind for training, or practice teaching, is made almost everywhere in institutions where teachers are educated. If the query arises: "Can these model schools be conducted successfully to the real benefit of the student-teachers and without injury to the young pupils?" the evidence at hand would seem to answer in the affirmative. In spite of certain inherent difficulties of managing a practice school with success, and although it is no doubt true that many of these schools are not *model* schools, experience has shown that it is quite possible for them to compete with the public schools of the respective localities, and even to surpass them in efficiency and excellency of management. Of the Toronto Practice School it has been said by a very competent judge that "the instruction is of the best kind. The fees of admission are higher than those of the high school. Notwithstanding Toronto is abundantly supplied with excellent schools, the model school has 400 pupils, all it can accommodate, and more than 1,000 registered applicants are waiting their turn to enter." Careful supervision of the work of the young teacher, and conscientious preparation on his part under proper guidance, go far to make up for certain advantages which the regular public school may have over such a practice school; so that the latter ranks high relatively, if not absolutely. It is evident, however, that the value of practice teaching to the student-teacher depends largely on the criticism which follows it; in criticising, "reasons based upon a sound philosophy should be given for the opinions expressed and conclusions reached." This condition is not always easily fulfilled, but it is by no means unattainable.¹

Of 124 public normal schools tabulated for the past year, 84 report practice training schools attached. These are of several grades, in some instances beginning with the kindergarten and including all the intermediate grades through the grammar school. Many of the city training schools are model schools entirely, a primary or grammar school being assigned for the purpose, in which the pupil-teachers have daily practice under the supervision of an experienced instructor. Recitations and lectures on professional subjects furnish opportunity for acquiring knowledge of the theory as exemplified in the practice of the art.

The system of "apprenticeship," as practised by the pupils of the State Normal School at Worcester, Mass., is worthy of note:

The student, after three terms, or a year and a half in the normal school, is allowed to go into one of the public schools of the city of Worcester to serve as assistant to the teacher of that school; to take part in the instruction, management, and general work of teaching, under the direction of the teacher; and even to act as substitute for the teacher for an hour, a half-day or a day, at the discretion of the latter and with the approval of the superintendent. One student only at a time is assigned to any one teacher; but each student serves in at least three grades of schools in the course of his term of service, the duration of which is six months, or half a school year. After finishing his apprenticeship, the student resumes his course at the normal school, spending another half-year there before receiving his diploma.

¹ Professor Lodeman, in paper read before Michigan Schoolmasters' Club.

During the period of apprenticeship, four days of each week are devoted exclusively to it by those employed in the work. One day of the week (Wednesday) is spent by them in the normal school, where they are employed, not in the ordinary study and work of the institution, but in the following manner: They hold such consultation with the teachers of the school and make such use of books as may be most helpful to them in their immediate work as apprentices; they make informal statements to the school of such facts of their experience as may be of advantage to the other students to hear,—concerning ways of teaching, cases of discipline and the like,—keeping in mind always the private character of the daily life of the school room, and under special warning against revelations that might seem objectionable. Each apprentice keeps a diary of the occupation and experience of every day's service, and this record is inspected by the faculty of the normal school. He also makes out a report at the end of his term, in which he gives his own estimate of his success in his work.

The apprenticeship is designed to give the student practical acquaintance with the work of teaching, and training in that work. It is founded in the conviction that, whether education be a science or not, teaching in the public schools of Massachusetts is an art,—an art to the successful practice of which there is need of some initiation under the guidance of experience and skill; an initiation akin to that which an apprentice passes through in learning his trade.

A secondary purpose is to furnish the faculty of the normal school with more full and satisfactory data for their estimate of the teaching ability of students. How the recruits will behave under fire cannot be determined by drill in the manual, or by dress parade. The apprenticeship goes far towards answering the important question. The apprentice is visited by the faculty of the normal school while engaged in his work, and is carefully observed and assisted by suggestions. The teacher of each school in which he has served makes out a report of the apprentice work of the pupil-teacher, on a scale of ten credits, showing the number of absences and tardinesses, power of control, power of interesting, skill in questioning, skill in explaining and illustrating, enthusiasm, bearing, with remarks on weakness or deficiency, and what traits of excellence (if any) have been shown in teaching or management.

The additional 6 months of preparation required by the system under consideration secure to the student greater maturity of body and mind. The need of such maturity is apparent in the case of the majority of those who enter upon the work of teaching.

That the object of the apprenticeship is attainable by the plan adopted, is not merely probable, but is already matter of experience. The method, although believed to be new in this country, is not in itself a thing new or untried.

The German system of public education requires of the candidate for the office of teacher a season of service under direction, of probation under supervision, the essential elements of which are embodied in this apprenticeship. Something like it also prevails extensively in England.

Moreover, the method is simply the extension of one that was for five years in successful operation in this school. The students are found to derive from their experience a fresh interest in their chosen work. They realize the practical bearings of the principles and methods they have studied; they acquire the "courage of having done the thing before"; they test their remedies for the school diseases of inattention, disobedience, and the like, by trial on actual patients; they acquire skill that is of vast moment to them at the critical period when they take charge, as teachers, of their first school.

It is no small evidence of good results that the school board of the city of Worcester heartily approve the system on the ground of the benefit accruing indirectly to the city schools, through the greater fitness of the apprentices to become teachers.

As the student of the normal school who passes successfully through the period of apprenticeship receives a certificate of the fact in connection with his diploma at graduation, the extra time required for the experience must in almost every case be more than made good by the greater probability of securing a position, and the greater likelihood of success at the outset of the teacher's career.

There are, however, individuals in the school for whom it is impossible or impracticable to undertake this special preparation. The apprenticeship is not enforced upon any student; it is simply recommended. Individuals who do not enter upon it enjoy all the advantages of the school with this single exception.¹

PHYSICAL AND MANUAL TRAINING AT NORMAL SCHOOLS.

In the matter of physical training, calisthenics and light gymnastics are the means most generally employed. Free movements, wands, rings, dumb-bells, Indian clubs, bars, chest-weights, etc., are in use, with out-door sports, and at some schools military

¹ Catalogue.

drill for male pupils. Well-equipped gymnasiums are provided at a number of the institutions, with special instructors, as at the Nashville Normal College, where an hour's exercise in the gymnasium is required on alternate days, under the charge of a lady and a gentleman director. Manual training is furnished chiefly in the construction of apparatus, with practice in the use of tools in schools where workshops have been established. At the Female Normal School at Salem, Mass., the use of carpenter's tools is taught to those ladies who may desire such instruction. At most of the normal schools for colored pupils industrial training is provided in connection with normal instruction; and at Hampton, Va., this is made compulsory, both as a matter of discipline and in order that the colored teacher may be self-supporting during the long intervals between the sessions of colored schools.

At white State normal schools where such instruction is given, it is not claimed that students are necessarily introduced to what is known as manual training, as this is not the primary object. The object is to enable students to furnish for themselves, at small expense, the apparatus which can be used for teaching elementary science in their future schools. This end may be fully accomplished, and none go out without an equipment which is ample at the beginning of their work. They also possess the ability to enlarge and perfect this equipment as occasion demands. Teachers thus supplied have the means of objective teaching no matter where they go, and the construction of such apparatus is stimulating to teachers, while the possession of it carries interest and delight as well as useful knowledge to the common schools.¹

In urging the necessity for manual and industrial training in the New York Normal College, where the course is four years, President Hunter says:

Inasmuch as the chief difficulty encountered in engrafting manual training on the common school system is the want of competent teachers, I would suggest that such teachers could be easily trained in the normal college, and a sufficient number prepared in a year or two to enable your board to introduce manual training in all the primary and female grammar schools of the city. If manual and industrial training is to become a part of the public school curriculum, the normal college is the proper place to make a beginning. At the end of the second year in the college, at the time when the professional work is begun, the students, through their parents, could be permitted to select either of two normal courses,—a normal course (the same as at present), or a normal course for manual and industrial training. This change could be made at a moderate cost, and the superior intelligence of our students would quickly enable them to master all the mysteries of manual training as far as it may be carried out in the common schools. The change would have this advantage, too, it would relieve the pressure by the regular graduates for positions as teachers of the ordinary classes in the common schools; and, above all, it would provide excellent employment for that class of students whose aptitudes run in the line of handicraft rather than in that of purely intellectual work.²

TEACHERS' INSTITUTES.

In discussing the professional training of teachers, next to normal schools in importance, we must notice teachers' institutes, associations, conventions, and reading circles. For the great mass of teachers who either from lack of time, means, or opportunity, have failed to acquire a special training in normal schools for the work of their profession, there is no instrumentality so helpful and so potent for good as the teachers' institute. This important feature of professional preparation has received recognition in this country for the last half century, and in the same year with the establishment of the two oldest normal schools in America, the first institute for teachers was held in the city of Hartford, Conn. So general is the recognized importance of this work that the States, with few exceptions, and also several of the Territories, have incorporated in the school laws a proviso for teachers' institutes, making attendance compulsory, and, in some instances, withholding teachers' certificates and imposing penalties for non-attendance. For two decades after their introduction, teachers' institutes led a desultory sort of existence, tentative and fragmentary, experiencing rebuffs of fortune, apathetic consideration at the hands of teachers and educators generally, though most seriously retarded by lack of interest and the paralyzing conservatism of legislators who failed to see the necessity or importance of these "peripatetic normals." Credit is due the New England States, however, for their early legislation on the subject, and the readiness with which the teaching fraternity accepted these powerful and necessary aids to educational progress. The Middle and several of the Western States, likewise, soon awoke to the practical value of institutes, and as early as 1847 we find legislative appropriations for these in New York State, which have been continued uninterruptedly since that date.

Dennison Olmstead, a graduate of Yale, projected a plan for a schoolmaster's academy in 1816; and Professor Kingsley, of the same institution, in 1823, proposed that intermediate schools be maintained in every county for thorough training of those

¹Connecticut State Report.

²Report of President.

who desired to teach in the common schools. Rev. Thomas H. Gallaudet advocated teachers' seminaries in a series of essays published in 1825, but the credit of the first regularly organized teachers' institute was reserved for Hon. Henry Barnard, then secretary of the board of education of the State of Connecticut, who with a few friends conducted the first meeting of the kind of which we have record, in October, 1839, in the city of Hartford. A class of 26 young men was assembled, and for 6 weeks they were instructed by able teachers and lecturers, reviewing and extending the topics then usually taught in common schools, and receiving thorough instruction in pedagogics with the advantage of observation in the public schools of the city. In the spring of 1840 a similar arrangement was made for female teachers, but for several years afterwards there were no meetings of a similar character. New York held its first institute in 1843, which was the first so named, and which was conducted by J. S. Denman, school superintendent of Tompkins County. This meeting lasted two weeks, and was a revelation of the new agent in school improvement. Rhode Island and Massachusetts took up the work in 1845; New Hampshire and Vermont in 1846, with Maine the year following. The western country, largely peopled by settlers from the more cultured eastern States, was not slow in building up schools and following out the lines of educational advancement as far as the sparsely settled districts would permit. Indiana reports an institute in 1846, believed to have been the first held in the State. Ohio had one in 1847, while Wisconsin held educational meetings somewhat like teachers' institutes before it assumed the dignity of Statehood in 1848.

Only meagre details of the form and scope of these pioneer institutes are accessible. They were often more of teachers' conventions than what we now understand as normal institutes; yet they gave an impetus to educational work, and inspired a feeling of dignity and pride in the profession that has been invaluable in the results to the cause of common school education. It is not to be supposed that they were generally of as long duration, or as professional in character, as the first institute held by Dr. Barnard. They were properly experimental, and, doubtless, usually disconnected and fragmentary, for at that early day the public school system itself was by no means efficient, and normal schools for the professional training of teachers had just made their advent upon the educational horizon. While in Wisconsin the present system of institutes grew out of the establishment of normal schools and pedagogical departments in seminaries, in Iowa the first statutory organization for the improvement of teachers in public schools was called a "teachers' institute," and for a long time these migratory *academies* supplied the place of schools of professional training. These early assemblies of teachers were purely voluntary, and grew out of ambitious endeavors to keep abreast of the progress of the age, and a conscientious desire to qualify themselves for the responsibilities of their position. Experience has corrected many of the evils of the earlier systems, and well-nigh perfected the teachers' institute as an essential factor in educational training.

It is sometimes urged by those who have either insufficient knowledge of the subject, or whose observation has comprehended only ill-conducted institutes, or those too ambitious in scope, and consequently superficial, that teachers' institutes interfere with the work of normal schools. They claim that the teacher students acquire only a smattering of the branches professedly taught, with a modicum of practical training; or else, by an energetic and systematic " cramming " process, they are enabled to pass the required examination and secure the coveted teacher's certificate, and thus swell the army of incompetents, whose chief work is the "artificial production of stupidity in schools." This impression is erroneous, as may be learned from the testimony of principals of normal schools, who, from their opportunities of observing results as conductors of institutes and at the same time professors in normal schools, are the best authority on the subject. As a body they indorse the teachers' institute as absolutely necessary to qualify the great mass of new recruits who each year enter the profession; and instead of creating the belief that the institute is a sufficient preparation for the work of teaching, as is sometimes alleged, these organizations, when wisely conducted, convince the teacher of his need of thorough training, and incite in many an ambition to pursue a complete normal course. Properly managed institutes are useful auxiliaries to normal schools where such exist, and they are important, though not perfect, substitutes where none exist. Even with normal schools established and supported by law, it is absolutely impossible to confine instruction in practical pedagogics to these institutions. The increase in population in the United States will always create a demand for competent teachers which the normal schools will be unable to supply, so that the great body of reserves must rely upon the institutes for practical training for their sphere of labor.

The legitimate and formal province of teachers' institutes, and their direct work, is practical and progressive instruction in methods and principles of teaching, and in organizing, conducting, and controlling schools. These objects are effected in a variety of ways. The managers must consider the educational status of the locality in which the institute is held, as well as the most important needs of the teachers who are to be instructed. In a community where normal schools of approved excellence

have been in operation for some years, the institutes may be of short duration. Their aim, under such circumstances, is to revive the spirit and confidence of teachers, awaken a pride in the profession, stimulate to self-improvement, and by a progressive course of study and instruction review the branches taught in the schools, and increase the practical acquirements of the teachers.

Where normal schools are few and small, or not yet established, where the public as well as teachers need to be enlightened, and where the attendance is voluntary, the institute acquires at once much greater importance as a factor in educational training. Under such conditions it assumes the proportion and duties of an itinerant teachers' seminary, and very properly extends its sessions into weeks instead of days, enlarging the scope of instruction, and increasing the number of methods and appliances for promoting efficiency and retaining popularity. Many of the mistakes which occur in the management of institutes, as conducted at present, arise from want of policy in not allowing this difference to govern the amount, kind, and method of instruction given.

Continued interest is manifest in the teachers' institute. In some States, indeed, this method of preparation supplies chiefly and well-nigh exclusively the lack of normal schools. In Delaware, North and South Carolina, Georgia, Arkansas, Colorado, and Nevada, these "migratory normals" are a power for good, and even in some States having one or more well-appointed normal schools, a vigorous and progressive system of institutes is maintained, attendance being made compulsory. Some of the States while requiring institutes to be held, make no appropriation for the expense, though, as a rule, provision is made for this purpose from the public school fund.

Teachers' meetings are held in nearly every town having a graded system of public schools. These are helpful in systematizing the instruction given in the schools, in strengthening weak teachers, in advancing and discussing both methods and matter, and in stimulating a healthy ambition and professional pride in the corps of teachers. Educational conventions are held in every State and in nearly all of the Territories. New Mexico has recently formed an association for the express purpose of promoting the educational interests of the Territory, and the prospects bid fair for success. Few, if any, States are without a State teachers' association, meeting annually or semi-annually for the discussion of educational problems. Sections of States, counties, cities, towns, and townships have their associations of teachers, all with one end in view—the improvement of the schools through the teacher.

TEACHERS' READING CIRCLES.

In the profession of teaching, as in other professions, the highest success must depend both upon a general culture and upon a technical training. General culture is needed that the teacher may be kept from the narrowness of a merely professional life, and a technical or professional training is requisite that he may be successful in the details of his work. The most available means for acquiring this training, outside of normal schools and institutes, is attendance at teachers' meetings, at State and local associations, visits of inspection to schools of acknowledged excellence, the formation of a teachers' library, and membership in a reading circle for the study of professional subjects as set forth in books treating upon the theory and practice of teaching, in books upon applied psychology and physiology, and in educational periodicals.

Of the value of reading circles as a means for general culture, Chancellor Vincent, of Chautauqua, says: "Reading circles give opportunities to those who cannot, or who think they cannot, attempt thorough study. If they once taste good literature and test their own capacity to appreciate and profit by it, under a system which requires nothing but 'reading,' they will be more likely to address themselves to the severer tasks of study. Reading circles, through the power of association, will promote enthusiasm in intellectual and literary pursuits, increase popular interest in local courses of scientific and literary lectures, lead to greater care in selecting the books which find a place in the house, tone up conversation, elevate the standard of household decoration, and in many ways improve the social standing of the family. These circles may embrace a wide range of literature, and thus bring within the reach of 'the people' the world of the learned, with its visions, pleasures, and inspirations. Reading circles may be organized to pursue courses in art, travel, history, current news, and all other subjects which are involved in a broad culture and in wholesome living."¹ As an aid to teachers the possibilities of this educational factor are very great.

Though the methods now in vogue may not be all that can be hoped for, yet with its crudeness the teachers' reading circle is perhaps the most valuable agency in existence to-day for the improvement of the rural schools, as these associations must supply the place of normal schools and institutes to a large part of the teachers of country schools. Whatever of knowledge they obtain of the theory and art of teaching, and whatever promptings they receive to enter upon the study of mind, and know something of the laws of its growth, may be set down largely to the credit of the

¹ Proceedings of the National Educational Association, Chicago, July, 1887.

reading circle. As to the true significance of the reading circle work, President Allyn, of Illinois, says: "The work of the teachers' reading circles is in the direction of healthful mental and moral progress. No one can read a good book without profit, and when such a book is in the line of one's life work it is both an inspiration and motive power."

The first organized effort in the direction of the reading circle idea seems to have had its beginning in a London "society to encourage home study," founded about 1870. A similar society was organized in Massachusetts in 1873, followed in 1878-79 by the most notable reading circle in existence—the "Chautauqua Literary and Scientific Circle."

The State teachers' reading circles are of more recent date. In Ohio, a common course of reading was marked out for teachers in 1882, and they were generally enrolled in a reading club for the purpose of uniformity of work.

Wisconsin claims to have suggested a similar plan at an earlier day, but to Ohio belongs the distinction of organizing the first State teachers' association, which was perfected in the year 1883. Indiana followed in 1884, and at present more than twenty States have State teachers' reading circles. It has been estimated that at least 75,000 teachers in the United States are reading methodically and systematically works bearing upon professional and general culture.

The objects of the State teachers' reading circles are substantially the same, namely, the improvement of the members in literary, scientific, and professional knowledge and the promotion of habits of self-culture. This end is sought by prescribing a certain course of study, securing books at reduced rates, preparing lists of the best educational publications, by offering advice and direction to the methods of reading and study, by examinations of the work done, and by certificates of proficiency.

The act of organizing the State circle has generally been accomplished at the annual assembly of the State teachers' associations, and the work is usually carried on under the control of this association. Directors, boards of management, etc., are chosen, who map out the course and direct the work of the circle. County and local circles are also formed, subsidiary to the general or State circle, and even individual members may pursue the course alone.

The conditions of membership are liberal, any teacher or other person being received who promises to pursue the prescribed course of study and pays the small fee—usually 25 cents or 50 cents annually. Meetings of local circles for conference, discussion, and review are held once a week in some States, and biweekly in others.

The course of study is usually outlined and published in the educational journals and in the county papers. In the preparation of these outlines a department of study is under the special supervision of some member of the State board. The object of this study is twofold, namely, professional and general culture. As for the prominence given to one or the other of these subjects, that will be determined by the actual needs of the teachers. The fourth year's reading (1886-87) for the Ohio Teachers' Reading Circle is given herewith, to indicate the general scope of such studies:

- I. *Psychology*.—Sully's Teachers' Hand-Book of Psychology.
- II. *Literature*.—"Hamlet" and "As You Like It;" selections from Wordsworth.
- III. *History*.—Barnes' Brief General History of the World, or Thalheimer's General History.
- IV. *Political Economy*.—Gregory's Political Economy, or Chapin's First Principles of Political Economy; with at least one educational periodical.

In a majority of the States provision is made for stated examinations of the work performed, and certificates are awarded with diplomas upon completion of the course. The Union Reading Circle, a paper published in the interest of this work, reports (June, 1887) three new societies in Georgia, two in Kentucky, five in Iowa, and twelve others in as many different States. Memorial days are now the fashion, the poets Bryant, Longfellow, and Tennyson, with Dickens and other literary men, receiving their share of honor in various places. The Agassiz Society, of Philadelphia, promises to make the summer vacation a grand opportunity for scientific research and study, and each one will contribute towards the common museum. The Gesenius, a new circle of Cleveland, makes Hebrew a specialty, as the Xenophon Society carries on the systematic study of Greek. The Curtis Society, of Buffalo, N. Y., studies politics and discusses all questions of reform. The Tulane Home Study and Reading Society is organized with headquarters at Tulane University, New Orleans, La.

Besides the State associations, others claiming a national character have been organized. In 1885 the Teachers' National Reading Circle was legally incorporated under the laws of New York. Prof. W. H. Payne, of Michigan, was chosen president, supported by 18 directors, constituting the official board. This organization provides 18 courses of reading, 6 being professional, 3 in general culture, and 9 non-professional. In the first, 27 books are recommended. Each course includes 3 groups of studies, 2 books in each group, and any course (three books for the year) may be taken by the reader. Diplomas will be granted to members who pass the three different ex-

aminations in some one prescribed course, and who prepare an accepted thesis on some educational topic connected with the reading.

The Chautauqua Teachers' Reading Union is a recent department of the Chautauqua University, and is under the personal supervision of Hon. J. W. Dickinson, secretary of the State board of education of Massachusetts and also principal of the department of pedagogy in the university. The course of study covers three years, a certificate being awarded for each year's work. The annual membership fee is 50 cents. The first year's reading includes (1) principles and methods of education, (2) general culture; the second year: (1) history of education, (2) primary and kindergarten work, (3) general culture; the third year: (1) psychology, (2) school economics and school supervision, (3) political science, (4) general culture.

The educational department of Canada prescribes a course of reading for teachers, purely voluntary, and hence followed by no examination. The department provides, however, that, "should the teachers of any inspectorial division agree to read the course with this end in view, and should the county board of examiners make adequate provision for such examination, the department would recognize, by special certificate, this additional element of professional culture."¹

SUMMER SCHOOLS FOR TEACHERS.

Summer schools are growing in numbers and popularity each year. Recreation, pleasure, and study are here combined for the tired, worn-out teacher, while new methods and improved theories are presented by some of the ablest educators the country affords. Some idea of the importance of this work may be learned from the statement that there were in various parts of the country no less than twenty different summer schools in active operation, with, it is believed, more than 2,000 students, the State of New York sending the largest number, Massachusetts and Pennsylvania the next largest. The educationally awakened South sent to one school in the North no less than sixteen teachers, seven of whom came all the way from Louisiana.²

It is the work of the several summer schools, organized in different localities, to train teachers in the more rational and natural methods which have been increasingly adopted in the most progressive schools of this country during the last 5 years. The new system is better for pupils, but is harder for teachers. It requires more ingenuity, a wider observation and culture, as well as good literary attainments and special training, but in compensation for more exacting work in teaching, discipline of pupils is easier, and "dull" classes are no longer the *bête noire* of the school room.³

The editor of the Journal of Education, Boston, July 7, 1887, says: "Thirteen years only have passed since Dr. J. H. Vincent called together a host of earnest men and women at Lake Chautauqua, and already forty-five assemblies are under the same general plan, influenced largely by the same general management. It is this unanimity of action that enables these gatherings to bring to our country such a man as President Fairbairn, of Mansfield College, Oxford, England; to bring from the Pacific coast such a teacher and lecturer as Col. Homer B. Sprague; and to take into an educational gathering men of such popular gifts as the Hon. George W. Bain, R. G. Horr, and John D. Long.

"The managers of these assemblies, the men who organize classes, teaching and inspiring teachers, are men whose knowledge of the art and science of teaching gives them deserved prominence as educators. Dr. Vincent stands, by natural tact and experience, at the head of this list, while Dr. J. L. Hurlbut, Dr. A. E. Dunning, Prof. R. S. Holmes, Dr. B. T. Vincent, and Dr. A. H. Gillet have, practically, equal skill as instructors and directors. Under their influence, public school teachers and teaching have in the warm season been very generally left for professional schools at Chautauqua, Saratoga, Asbury Park, Round Lake, Martha's Vineyard, Glens Falls, Niagara Falls, Amherst, Ann Arbor, Normal Park, etc., but they have furnished high literary inspiration, close study of Shakspeare, Milton, and other English classics, as well as created the science of Sunday School teaching on pedagogical principles. The assembly idea is a success, with permanency insured. The forty-five assemblies of 1887 will certainly be largely increased in the near future."

Following is a list of summer schools held during the summer of 1887, compiled from available data furnished this Bureau. In addition to these, a number of colleges and universities held special sessions during the vacation: Amherst Summer School, July 6-9; Asbury Park Seaside School of Pedagogy, July 18 to August 5; Batchellor's Tonic Sol-fa Institute, Philadelphia, Pa., June 22 to July 12; Blackboard School, Cedar Falls, Iowa, July 5-26; Chautauqua College of Liberal Arts, New York, commencing July 9; Curry's School of Expression, Saratoga Springs, N. Y.; Glens Falls Training School, New York, August 1-26; Hamill's School of Elocution, Chicago, Ill., June 1 to July 18; Haupt's German School, Boston; Kindergarten, Mountain Lake Park, W. Va., July 12 to August 20; Manual Training School, Saint Louis, June 20 (six

³ Report, Springfield, Mass.

or eight weeks); Martha's Vineyard Summer School, July 11, five weeks; Missouri Teachers' Summer Academy, Sweet Springs, June 24-31; Monroe College of Oratory, Boston, July 12 to August 13; National School of Elocution and Oratory, Ann Arbor, July 5 to August 13; National Summer School of Methods, Saratoga Springs, July 18 to August 5; Niagara Falls Summer School of Methods, July 18 to August 5; North Carolina Teachers' Assembly, Morehead City, June 14-29; Summer Review Term of the Michigan Normal College, Flint, July 5, eight weeks; Normal and Business College, Fremont, Nebr., July 5 to August 13; Northwestern Summer School, Normal Park, Ill., July 18, three weeks; Round Lake Summer School, near Saratoga, N. Y., July 11 to August 6; Sauveur Summer School of Languages, Oswego, N. Y., July 11 to August 19; Seward's Tonic Sol-fa Institute, Fredonia, N. Y., July 6-21; Summer Course of the Physical Training School, Harvard University; Straub's American Normal Musical Institute, Charleston, Ill., July 11, four weeks; Summer Courses in Chemistry at Harvard University, July 11, continuing six weeks; Summer School, Holton, Kans., July 7 to August 2; Summer School of Philosophy, Concord, Mass., commencing July 13; Summer School of Pedagogy, Ann Arbor, Mich., August 5-20; Stern's Summer School of Language, Saratoga Springs, July 11 to August 12; Summer School of Pedagogy, Wisconsin University, four weeks; Summer School of Languages, Cornell and Iowa Colleges, Iowa, July and August; Summer Schools at University of Virginia.

PRESENT CONDITION OF NORMAL TRAINING.

The following general summary, by States, of the system and progress of professional schools and appliances for the training of teachers, is compiled from the latest accessible reports of State and city superintendents, school laws bearing on the subject, catalogues and returns from normal schools, educational journals, etc.:

ALABAMA.

Alabama has 6 normal schools, 3 for white and 3 for colored students. These schools are located at Florence, Jacksonville, and Livingston for white pupils; and at Huntsville, Tuskegee, and Montgomery for colored pupils. The last named school was formerly at Marion. Hon. Solomon Palmer, State superintendent of education, reports these schools in a prosperous condition, and doing an invaluable work in furnishing the public schools of the State with well-qualified and well-trained teachers.

The course of study covers from 2 to 4 years, and comprises mental science, pedagogics, mathematics, English literature, ancient and modern languages, natural science, and vocal and instrumental music. At some of the schools there are college preparatory departments and post-graduate courses. Any student of suitable age and attainments may enter, and tuition is free to normal pupils signing a pledge to teach 2 years in the public schools of the State after graduation. Diplomas for the entire normal course authorize the holders to teach in public schools of any grade without further examination. All the schools have practice work in model schools or sub-collegiate departments.

The last General Assembly established a white normal school at Troy, Pike County. The citizens of the town, as soon as the bill became a law and the location decided upon, at once raised funds to erect for the accommodation of the school a suitable two-story brick building, which has been furnished and is now occupied. The school began its first session in September, 1887, and under the same management and in connection therewith a high and graded school is operated, with 10 teachers and nearly 300 pupils in all departments, including the normal.¹

The Legislature repealed the act establishing a normal school for colored teachers at Marion, and in the same act provided for the establishment of a "university for colored students," with an annual appropriation of \$7,500 for current expenses, and \$10,000 to procure suitable buildings. This school, with normal and industrial departments, is located at Montgomery, and has a large attendance. Provision was also made for another colored normal school in Greene County.

In the schools for colored pupils already established, industrial departments are maintained, largely through the liberality of the Slater fund, in which the trades for each sex are practically taught, a certain amount of this work being required. At Tuskegee farming is added to other industries, and this school has recently received a donation of \$6,000 from a few Boston ladies for the general improvement of the institution.

In addition to the State appropriation of \$26,000 for normal schools and teachers' institutes, the Peabody fund has been more liberal than ever before in its contribution to the same cause. For this purpose alone, not including other gifts from the same source, during the past year the fund has contributed to the State in the aggregate over \$6,000, divided among the 13 normal scholarships at Nashville, white and colored normal schools in the State, and congressional teachers' institutes. Of the 13 Alabama students holding State scholarships at the Normal College, at Nashville, Tenn.,

¹ State Report, and Alabama Teachers' Journal, Oct., 1887.

3 graduated in the class of 1887. Applicants for these scholarships are required to stand a competitive examination held at the various congressional institutes.

Birmingham has a training school with a special course of one year for the preparation of high school graduates, and others of equivalent qualifications for the work of teaching, with special reference to the schools of that city. The course comprises the usual pedagogical studies, with lectures and practice work.

Decatur.—In this town teachers' meetings are held at stated intervals. The teachers are specialists of experience, and mostly graduates of approved normal schools.

Montgomery.—In this city lectures and teachers' meetings are arranged and successfully conducted.

Talladega has a normal class meeting every two weeks.

Tuscaloosa has teachers' meetings at the call of the superintendent.

A new feature in educational matters for the past year was the Congressional Teachers' Institute. Under the inspiration of the progressive State superintendent, the Legislature made a special appropriation for an institute in each congressional district. The legislative appropriation of \$500 was supplemented by a like amount from the Peabody fund, and with this sum the State superintendent conducted 15 institutes, 10 for white and 5 for colored teachers. The interest awakened in the community at large is shown by the fact that wherever such assemblies were held the people offered strong resolutions thanking the instructors, the Legislature, and the State superintendent for this new departure in Alabama education. In addition to the congressional institutes, the State superintendent held annual county institutes in twenty-two counties. In each of these he reports a growing interest in the public schools among the people, and in many instances earnest efforts are made to establish and maintain schools of higher grade, which was shown by the anxious inquiry for well-qualified and successful teachers, by building more comfortable school-houses, and by very large and attentive audiences at the institute and other meetings held for educational purposes.¹

The white and colored teachers maintain separate State associations, which are growing in numbers and importance. The sixth annual meeting of the State Teachers' Association (white) was held at Tuscaloosa July 5-7, 1887, and is reported the largest and most successful ever convened. A resolution was passed endorsing the movement to erect an Alabama teachers' home at Monteagle, and each teacher in the State was requested to contribute 50 cents or more to this enterprise.

The Colored Teachers' Association met in Birmingham, April 14-16, 1887. The State superintendent, speaking of this meeting, says: "No one can witness a gathering of these teachers, as I have done for the past two years in their annual meetings, without being impressed with their burning desire to secure the benefits of an education for their race, and with their wonderful progress since the war. They deserve encouragement by the State."²

The Alabama Teachers' Reading Circle received an impetus at the first State normal institute, held at Florence in 1886, and a large number of teachers were enrolled. The first year's course of reading selected was Barnes's General History, Page's Theory and Practice, Watts on the Mind, and selections from Hawthorne's works.

ARIZONA.

This Territory established a normal school in 1885, located at Tempe, in Maricopa County, central Arizona. The school was first opened for instruction in 1886, and reports 53 students and 5 graduates for the year 1887. The course of study comprises an elementary and an advanced course; the former requiring 2 years, the latter 3 years for completion. At the conclusion of either of these courses a corresponding diploma is granted which permits the holder to teach in the public schools of the Territory. The requirements for admission are 16 years of age; a valid certificate, either Territorial or county, of any grade; a diploma of graduation from any public grammar or high school; and an examination in the common branches for those not possessing either a certificate or diploma. Tuition is free to those intending to teach in the public schools of the Territory and also to those nominated by a member of the Legislature. Others are charged \$4 per month. A Territorial appropriation of \$5,000 was made for last year. The school reports the beginning of a library, and estimates the value of grounds, buildings, and apparatus at \$10,000.

Teachers' institutes from 3 to 5 days each are required by law when the number of school districts will justify. Attendance is compulsory, and the expenses are drawn from the county school fund.

ARKANSAS.

The Branch Normal College of the Arkansas Industrial University, at Pine Bluff, is intended for the education of colored teachers. This school has been in operation since 1877, and is designed for "the training of teachers for effective service in the public schools of the State," the law establishing the same having been enacted with

¹State Report.

²Ibid.

special reference to the "convenience of the poorer classes." Two courses of study, covering 2 and 3 years respectively, include the usual normal branches. There is no charge for tuition for appointees, the only requirement for admission being suitable age and qualifications, an appointment from one of the county judges, and the payment of \$5 entrance fee. Students thus appointed are entitled to 4 years' free tuition, and by the apportionment among the several counties of the State, according to the population, 395 students are entitled to the benefit of this law.

The chief provision for the training of white teachers is in the Peabody normal scholarships at the Normal College at Nashville, Tenn., and the Peabody normal institutes held throughout the State. Of the 10 students at Nashville to which Arkansas is entitled, 2 graduated in the class of 1887. The normal institutes are of one week each, and are required by law to be held annually in each judicial district of the State. They are so distributed as to reach every section, and make attendance comparatively easy. The work of these normal institutes is intended to be plain and practical, and instruction in the best methods of teaching the common school branches is imparted by performing the work of a teacher before the class.

The State superintendent commends the summer work of the institutes and affirms that they are an indispensable auxiliary to the development of first-class teachers, and suggests that the school laws be so amended that teachers be required to attend institutes, present reasonable excuses for their absence, or forfeit their certificates. The Peabody fund being insufficient for this purpose, he asks that it be supplemented by a reasonable appropriation from the State, and recommends that institutes of 4 weeks be held in each congressional district. There are separate institutes for the white and colored races, though in some instances both attend the same meeting. A noticeable result of the normal institutes is the formation in a number of counties of regular teachers' associations.

The twentieth annual meeting of the State Teachers' Association was held at Lonoke, June 22-24, 1887. The Southwestern Arkansas Teachers' Association met at Lewisville, October 9, 1886.

Arkansas has a State teachers' reading circle. Pulaski County teachers have inaugurated a reading circle with a membership of over 70, and are following a course of reading and study relating especially to their work as teachers.

CALIFORNIA.

The normal schools of this State at Los Angeles and San José are reported to be in a most satisfactory condition. In the present arrangement of the schedule of studies, night study is diminished somewhat by allowing more time during the day. Close individual discrimination as to the comparative standing of students is done away with, and those in the upper third of the class are now considered as honorary students, without individualizing any above or below the line of demarkation. The positions of salutatorian and valedictorian are also abolished, which will prevent undesirable competition for the honors. To summarize the recent reforms, they may be stated as emphasizing the technical features of the schools, improving the status of the faculty by making the tenure of professorship permanent, diminution of the overburden of labor, and the prevention of unhealthy competition for honors. Three years are required to complete the course of study, which consists of the usual branches taught in all grades of the public schools with approved professional work.

New laws relating to the State normal schools were passed by the Legislature in March, 1887, of which the most noteworthy features are given. The names of the schools are changed from branch State normal to State normal schools. Among other duties, the boards of trustees are required "to establish and maintain training or model schools, and require the pupils of the normal schools to teach and instruct classes therein." Teachers holding State certificates of first and second grades may be admitted to the normal schools from the State at large. Residents of other States may be admitted upon letters of recommendation from the Governor or State superintendent thereof. A declaration to teach in the State of California, or in the State or Territory where the applicant resides, is required of every candidate for admission. No charge is made for tuition. County and city boards of education may grant teachers' certificates without examination to holders of California life diplomas, California State educational diplomas, California normal school diplomas, the State University diplomas (when recommended by the faculty of the University), unexpired State certificates, and city certificates granted in other cities of California, and State normal school diplomas of other States. Educational diplomas are granted to graduates of the State normal schools who have afterwards taught successfully for three years in the public schools of the State, and also to each pupil who worthily completes the post-graduate course at the normal schools.

An act approved March 9, 1887, appropriated \$50,000 for the erection of a normal school for the northern portion of the State. The site selected is at Chico, Butte County, on a beautiful tract of ground, 8 acres in extent, donated to the State by General Bidwell, of Chico. The value of this gift, with the water right, is at least

\$20,000, and to this the town of Chico has added \$10,000 in coin. The building is now in process of construction, and is to be of brick, three stories in height, and modelled somewhat after that at Los Angeles. It is expected that the school will be in operation within a year.

In July, 1887, the normal school at San José completed a quarter century of its existence. A history of the school is to be issued to show especially what the institution as a normal school has accomplished for the State through its graduates. The attendance for the past session is the largest ever enrolled. The school at Los Angeles is also largely attended and thoroughly equipped for professional work. Members of the senior class at this institution have the advantages of a training school composed of five grades of the city public schools, under the charge of regular teachers, in which normal instruction in methods of teaching and governing are practically applied.

The normal class in the San Francisco Girls' High School has a professional course extending over one year, to which only graduates of the high school are admitted. At the beginning of the school year the pupils of this class are divided into two equal sections, which alternate monthly from professional study to practical work in the school room, the members being distributed among the different primary departments of the city for practice work. At the end of each month the principals of these schools are required to make to the superintendent a written report on the success of each pupil-teacher, and at the end of the year these reports are examined and due credit given for practical success in teaching.

There are two inspecting teachers in this city, whose duty it is to thoroughly acquaint themselves with the improvements in the methods of conducting schools, and of teaching, and to exemplify these methods in the various schools. They are also required to examine the work of the teachers and pupils from time to time, and report to the superintendent and the board, making such suggestions as may seem desirable or necessary for the greater efficiency of the schools. The city superintendent reports this work of inspection as highly successful and promotive of zeal upon the part of both teachers and pupils.¹

New life has been infused into the institute work of the State, and county institutes are becoming more effective and popular. The institute held in San Francisco in July, 1886, was attended by fully one thousand educators, besides many persons from the State and abroad, interested in the cause of education. The annual State institute of California teachers held its session at San José, December 26 to 29, 1886. Among the topics discussed were the proposed amendments to the school laws, and measures were adopted to compel more regular and general attendance at teachers' institutes. The teachers of San José hold monthly meetings throughout the year, which are usually informal discussions of school matters.

A State teachers' reading circle was organized in March, 1887, and a course of study in professional works on education, history, biography, literature, and philology mapped out. Any teacher or other person in the State may become a member by forwarding his name, a fee of 50 cents, and his pledge to pursue the prescribed course of study to the board of directors of his county.

COLORADO.

Colorado has as yet no public normal school, and since the supply of teachers in the State exceeds the demand, owing to large districts sparsely settled, the need of such professional schools is not pressing. The State University, at Boulder, has established and maintains a normal department. Concerning this, the State superintendent reports: "The only direct or special work done in this department has been by a course of lectures on methods of instruction. These lectures were given by the president and two members of the faculty. The academic studies of this class have been the same as provided for the preparatory classes."

By amendment of the school laws in March, 1887, it is enacted that State diplomas shall only be granted upon public examination, etc.; "Provided, That the State board of education may, upon the recommendation of the State board of examiners, grant State diplomas without examination to persons who, in addition to good moral character and scholarly attainments, have rendered eminent services in the educational work of the State for a period of not less than 5 years." For the purpose of organizing and maintaining teachers' normal institutes, the State is divided into six institute districts, and new counties formed within the limits of any institute district are to be included in that district. A normal institute may be held annually for a term of not less than two weeks in each normal district of the State, and each county superintendent is authorized to add 5 per cent. to the average standing in examination of teachers who shall attend this institute from his county. The institutes receive county and State aid, in addition to the registration fees paid by the teachers.

County superintendents may hold meetings and county teachers' associations whenever in their judgment the interests of the school work demand it. Local teach-

¹ Report of the Superintendent of Schools.

ers' associations have been organized in a number of the counties, and district and county educational meetings are also held.

Aspen.—The teachers of Aspen are allowed a half-day each term to visit schools, for the purpose of observing modes of discipline and instruction as adopted in other departments.

Fort Collins.—A monthly institute is held at Fort Collins, with weekly teachers' meetings, and the opportunity is given for visiting schools.

Leadville has monthly teachers' meetings.

The twelfth annual meeting of the State Teachers' Association was held at Colorado Springs, December 23-30, 1886.

CONNECTICUT.

The normal school at New Britain is reported in a prosperous condition and steadily improving in the quality of its work. The present corps of teachers is not only efficient and enthusiastic, but appears to make it a point to devise fresh and improved ways and methods of instruction from year to year. A special appropriation of \$7,000 for improvements about the building has resulted in better facilities for heating and ventilation, which are now entirely satisfactory. In the third or attic story have been placed a commodious workshop and an exceptionally well-equipped gymnasium. A systematic course of physical training is obligatory upon every student; and a regular instructor is employed, and classes give one period every day to gymnastic work. The number of pupils is as great as the school can accommodate and successfully train. The graduates of 1887 numbered 62, constituting the largest class that has ever been sent out. All of them are teaching, and thus in one year the school has supplied about one sixth of the beginners in the State. The demand for these professionally trained teachers is far in excess of the supply. Every year it is estimated that not less than two thousand visitors inspect the school, many of them teachers, whose purpose is to observe the methods in use in the various model schools.¹

The course of instruction at this school occupies 2 years, but for those who find the work too difficult, because of inadequate preparation or defective training, a special course with an extra term is provided. The common school studies, the English language and English literature and elementary science, are regarded as essential to intelligent teaching, and to these special attention is given. In all branches the topical method is chiefly pursued, and students are encouraged in independent investigation.

The training department is a distinctive feature of the school, and the course extends over a full year. No part of this course can be omitted, whatever may have been the previous preparation of the student. The model schools comprise all grades, from an extensive kindergarten training department to the highest grammar grades. Students of the normal school are introduced to a great variety of elementary forms of technical work. Kindergarten occupations, moulding, modelling, the use of tools, writing, drawing, coloring, gymnastics, and experimental work in physiology, chemistry, and physics, are the technical features in which instruction is at present given.² The advantages of the normal school are offered free to all who declare their intention to teach in the common schools of the State, and necessary text-books are provided without charge.

New Haven has two training schools—the Cedar Street School, which is a practice rather than a method school, and the Welch School, with a normal course of one year. Two distinct lines of effort are carried on in these schools: (1) the teaching and training of the children who attend them; (2) the initiation of young teachers into the true theory of education, and the application of that theory to actual school work. The training school course has so grown in favor with the graduates of the high school that there is every reason to believe that the supply of teachers will soon be equal to the demand. Of the class graduated in April, 1887, more than thirty have signified their desire to take the training course.³

The Welch School is of a twofold character. Standing on the same plan as the other grammar schools of the city, it has in addition the kindergarten and the training departments. During the first half-year the training class forms no part of the teaching force, but during the latter half the young ladies in training go into the rooms to take their share in the actual work of the school. Through the generosity of a friend, the Welch School has received the nucleus of a teachers' library. Cedar Street School, in addition to the work with teachers during school hours, has biweekly teachers' meetings after school, with other work of a professional nature.

Bridgeport has a training school, but no information has been received concerning it. During the past year more than one-half the teachers formed a teachers' reading union, under the auspices of the Chautauqua Union, and held regular semimonthly meetings.

¹ Annual Report of the Board of Education, 1883.

² *Ibid.*

³ Report of the City Superintendent.

Enfield had a series of teachers' meetings, which were informal home gatherings.

New Britain held meetings, but the time is not stated.

New Haven had several general meetings of teachers during the year, at which prominent educators of the State and elsewhere took part in the exercises. Something has also been accomplished in some of the subdistricts in the way of systematic study of some standard work on the science and art of education. The principals and superintendent held monthly meetings, when the various interests of the schools were discussed and improvements suggested.

Norwich held regular teachers' meetings. Studies in physiology and hygiene were continued for 13 weeks, with weekly recitations after school hours. A reading club was organized, meeting once in two weeks, at which portions of "Swett's Methods of Teaching" and "White's Elements of Pedagogy" were read and discussed.

Salisbury.—The association of the teachers of Salisbury held ten sessions during the year, of which the most important result seems to be the *esprit de corps* developed in the teaching force.¹

Thompson had a series of meetings, introduced by the school board but maintained and carried on by the teachers.

Institutes and teachers' meetings are becoming more numerous throughout the State, and are more generally attended year by year. These are held under the direction of the State by local school officers, and also by voluntary association. It is proposed by the State board to form a State teachers' union, which shall have for its object the improvement of public schools through the teachers, a result to be accomplished by teachers' meetings, courses of study and reading for teachers, and investigation of work done. A summer school for teachers is announced to be held at Niantic for 2 weeks, beginning the first week in July. The fortieth annual session of the State Teachers' Association was held at New Haven, October 29-30, 1886. Connecticut has a State teachers' reading circle.

DAKOTA.

There are two normal schools in the Territory, one at Madison, and the other at Spearfish, in the Black Hills region. These schools are supported entirely by Territorial appropriations, and aim to give thorough training and preparation for the profession of teaching. Tuition is free to all residents of Dakota who signify their purpose to teach in the public schools of the Territory. The schools are managed by boards appointed by the Governor.

The State Normal School at Madison was destroyed by fire in February, 1886, but its fine building and library were at once restored by the enterprising citizens of Madison. The Legislature at its last session made an appropriation to reimburse those who had contributed to the rebuilding.² This school offers an elementary course of 3 years, and an advanced one of 4 years. Both normal and professional certificates will be given hereafter.

The Territorial Normal School at Spearfish has received an appropriation of \$25,000 for a new building, which is to be ready for occupancy at the opening of the fall session in 1887. The school has an endowment of twenty sections of excellent land which can not be sold for less than \$3 per acre. This school has at present only the elementary course of study of 3 years, but students entering the school prepared to pursue the higher branches will receive instruction in such of these subjects as they may elect. Both institutions have model schools attached. By a recent school law no certificates are issued to undergraduates. Those completing either the elementary or advanced course of study are entitled to the diploma of the Territory.

In addition to these a normal school has been established at Springfield, but no appropriation has ever been made to support it. The last Legislature made further provision for professional training of teachers at public expense in its act authorizing the Territorial board of education to designate 10 private or sectarian schools to give normal training to classes of not less than 10 nor more than 25 pupils, the tuition to be paid from the Territorial treasury at the rate of \$1 per week for each student. Seven of these appointments have thus far been made, as follows: Jamestown College, Tower University, of Tower City, Groton College, Redfield College, Pierre University, Mitchell University, and Scotland Academy. The board has prescribed the course of study and training to be pursued, and formulated the rules and regulations governing the conduct of the classes and admission to them. Besides these free normal schools, the Territorial universities have normal departments, to which admission is free. Nearly all the sectarian colleges and academies maintain normal courses, and a private normal school has recently been established at Milnor, Sargent County, which is the first organized in the Territory by private enterprise.³

In addition to the usual certificates of three grades granted by the county superintendent, the Territorial board grants upon satisfactory examination other certificates of two grades. These are the normal certificate valid for 5 years, and the professional certificate valid for 10 years. The standard of qualification is being gradually raised

¹ Connecticut State Report.

² Report of the Governor of Dakota.

³ Ibid.

and weak and inefficient teachers are crowded out by rigorous examinations and the advancing standard of proficiency.

A special feature of the educational system of Dakota is the teachers' institute. Much interest has always been manifested by teachers and school officers in this means of improvement, and the recent school law adds further to its efficiency by placing the work under one general head, thereby making uniformity and system possible. All institutes are now under the general control of the Territorial board, and the instructors are appointed by the Territorial superintendent, with the advice of the board. Formerly one institute a year has, in general, been held in each county. The board is now planning to hold two institutes annually in each county. They are arranged for two courses, one in the autumn and one in the spring season, and the instructors being given continuous employment during the course are thereby enabled to work for a lower rate per week. This reduction in the expense, with the increase of revenue for institute purposes, makes two sessions a year possible. The funds for the support of institutes are derived from three sources: (1) The Territorial Legislature has appropriated the sum of \$50 to each county having ten or more resident teachers; (2) each applicant for a county certificate is required to pay to the county superintendent \$1 to create an institute fund; (3) the county commissioners are empowered to appropriate the sum of \$50 or less for institute purposes. The institutes, as rule, are in session but one week. The law also provides for township institutes at least one Saturday of each month. Many of the county superintendents are using these meetings as a means of unifying the county work by giving instruction in grading the schools and other work of the kind.¹

Numerous voluntary association meetings of teachers are held, and their discussions and deliberations are interesting and instructive. Among these the teachers' associations of North Dakota and South Dakota are the most notably successful ones. They have a large membership of teachers in the common schools, high schools, and colleges, and hold annual sessions at various accessible points in the Territory. The South Dakota Association held its fourth annual session at Mitchell, June 28-30, 1887. Besides these, the Sioux Valley Association and numerous county associations are in successful operation.

A reading circle, with a four years' course, has been organized by the South Dakota Teachers' Association. The teachers are engaging in the work in many counties with commendable zeal, and it is proving an efficient means of self-improvement. The reading circle is aided financially by all funds collected as fees for Territorial certificates. Each member also pays the sum of 50 cents upon joining the circle.

DELAWARE.

One of the great needs of the State is a normal or training school for the professional preparation of teachers.² Notwithstanding the urgent recommendation of the State superintendent that such an institution be established, and the assurance that no appropriations would be needed for buildings or current expenses of the school, the Senate of Delaware, in its session of 1886-87, defeated a proposed bill for a State normal school, though the buildings are said to have been offered free of expense.³ The only expenditure necessary would be that of providing free tuition for a number of students. Sixty free scholarships continuously maintained at a school of this character, which ought to yield thirty graduates a year, would cost only \$2,400, or about 1½ cent. per annum for each inhabitant of the State.⁴

Wilmington has a training school, four divisions of which are taught by pupil-teachers who are in training and on trial. There are 6 of these teachers, and they receive no salary.

The value of the institutes in this State is almost incalculable, as the lack of a normal school for the training of teachers leaves whatever work is done in that direction for the county institute.⁵ Each of the three counties of the State held an institute during January, 1887.

Delaware has a State teachers' association.

DISTRICT OF COLUMBIA.

Normal instruction for white pupils is provided for by the Washington Normal School. The scholastic year beginning September, 1886, marked an increase in the number of pupils and in the work at this institution. The faculty consisted of the principal, two teachers of methods, two practice teachers, and the teachers of music and drawing. The course of study is chiefly professional and is limited to one year. Hand in hand with the work in theory and methods proceeds the practical application of both. "The manual training in the primary classes proved a success. The training of the eye and hand in making form and representing it, the oral description of the work, followed by a written account of it, made a unit of physical

¹ Report of the Governor of Dakota.

² State Report.

³ Michigan School Moderator, May 19, 1887.

⁴ State Report.

⁵ Ibid.

and mental discipline founded on universally acknowledged psychological principles." The importance of enlarging the library and the establishment of a reading room is urged as necessary to the better equipment of the students for their profession.¹

The Miner Normal School, organized on the same plan as the Washington Normal, prepares colored teachers, and heretofore has received the support of the Miner fund. By the terms of agreement this aid terminated with the last session, and the school will hereafter be maintained by the District funds. The professional training is commended as having given to the teacherships a degree of efficiency that has aided most materially in the growth and progress of the schools.²

Model schools are attached to each of these normal schools. The selection of pupils for the normal schools is made from graduates of the high schools, the number being limited to 40, of whom 10 may be male. Each candidate must be at least 18 years of age, and must pass an examination equivalent to that upon which teachers' fourth-class certificates are issued. An examination of candidates is held in the month of June, and those standing highest in scholarship are admitted in the order of their rank. A pledge is exacted to continue the course until completed and afterwards to teach for a period of at least 2 years in the public schools of the District. Graduates of the normal schools receive certificates equivalent to fourth-class certificates, good for one year. After having taught satisfactorily not less than one year, they are entitled to receive diplomas which are equivalent to fourth-class certificates.³

Teachers in the District are required to attend all meetings to which they are called, and all special classes for their instruction organized by the superintendent.

FLORIDA.

The superintendent of public instruction for this State reports that a normal college for each race has been organized and opened during the year 1887. The school for whites is located at De Funiak Springs, Walton County, the headquarters of the Southern Chautauqua. In a perfectly healthy climate, surrounded by a beautiful country, and having an excellent corps of instructors, the college looks forward to a course of usefulness and success. A school has been organized under precisely the same circumstances and in the same manner for colored persons who desire to prepare themselves for the work of teaching. This school is also provided with an excellent and earnest corps of teachers, and is located at Tallahassee, the capital of the State. In both of these institutions tuition is free, and there is no expense except board, which may be obtained at moderate cost. Normal departments are also reported at De Land College, Volusia County, and at Rollins College, Orange County. The Peabody normal scholarships at Nashville have been withdrawn.

Teachers' institutes have been well attended, and much interest is manifest among those for whom they are primarily intended, as well as among the citizens generally. The expenses of these meetings were greatly reduced by the liberality and economy of instructors and the favors of public carriers, as railroad and steam-ship companies, etc. Normal schools for colored teachers were organized and conducted at Tallahassee and at Gainesville, each for 2 months. Competent instructors were provided, and the aim was to make the instruction practical in every sense and to inspire teachers with a proper ambition and impress upon them the dignity and importance of their profession. They were "deeply impressed and studious, evidently trying to take in all that was possible to them. Those only were given certificates, as the law directs, who passed the examination required, fully up to the mark." For the year 1886 the State Legislature appropriated \$1,000 for the purpose of holding teachers' institutes at such times and places as the State superintendent might designate.

The first annual session of the Teachers' Normal Institute was planned by the managers of the Florida Chautauqua, and held at De Funiak Springs, February 23 to March 31, 1887.

A State teachers' association has been organized.

GEORGIA.

The State school commissioner of Georgia reports increased interest in public schools among the members of the Legislature, but, as yet, no legal provision for normal schools or teachers' institutes. The liberality of the Peabody Fund makes the latter possible and efficient, and the normal scholarships at Nashville, received from the same source since 1877, offer some opportunity of professional training to the teachers of the State. A few academies also announce normal departments, and several boards of education in the cities and larger towns maintain normal classes during the scholastic year. The lack of facilities for training teachers in the State is the subject of an earnest appeal by the school commissioner for normal schools for both races. He shows conclusively that the largest proportion of schools, those taught in the country, must be supplied by teachers who lack collegiate education,

¹ Report of the Principal to Superintendent of Public Schools, Washington, D. C.

² Report of the Board of Trustees of the Public Schools, District of Columbia,

³ Course of Study of the Public Schools, etc., District of Columbia.

and who must necessarily depend upon professional schools of training. He suggests, as a beginning, that the State university and the male and female colleges make provision for pedagogical instruction, with special reference to those persons who expect to become country teachers. The trustees of colored colleges, it appears, have already taken steps in that direction, and with most valuable results. The commissioner further suggests to the teachers of private high schools to prepare themselves by special study to teach pedagogical subjects, and to make a feature of the *curricula* of their schools the preparation of young persons intending to teach in the country.

For the year 1887 Georgia held 14 Peabody normal scholarships at Nashville, with 10 graduates in a class of 54.

Americus reports a normal class comprising the teachers in the public schools of the town. Special assistance is given to those having charge of primary classes and to those having little experience in their profession.

Athens has weekly normal sessions of teachers, and the instruction seems to be appreciated as well as highly useful.

Atlanta has a normal class for white teachers which meets weekly during the school year. A separate class for colored teachers will be organized when the number will justify such an organization. A general meeting of all the teachers of the city is held the first Saturday of each month. At this meeting the teachers are paid their salaries for the previous month, and institute work is practically conducted. The remaining Saturdays are occupied respectively by the teachers of the high school, of the grammar grades, and of the primary grades. In these meetings regular lessons taught in the respective departments are recited, and methods of teaching them fully discussed.

Columbus has a normal class for white and for colored teachers. The work consists of institutes and teachers' meetings, the former being conducted by the superintendent twice a month with the whole class, and the latter by the principals of white schools, each in his own school, twice a month.

Glynn County, including the city of Brunswick, has two normal classes, one for each race, and all the teachers of the schools are required to attend and take part in whatever exercises may be held.

Griffin.—The teachers of Griffin are required to meet as often as may be deemed advisable to receive instruction on the subject of teaching and discipline, the nature of the school system, and the best means of accomplishing its object.

Rome has weekly normal classes for each race, conducted separately. Regular and special teachers' meetings are also held.

Savannah has a weekly normal class for the instruction of public school teachers, "and of such other persons in this city and county as may desire to prepare themselves to be teachers." Members of this class always have preference in case of appointments, and certificates from the president of the board and the superintendent are given to those who complete the prescribed course of study.

In order to continue and to render more effective the institute work of the State, the school commissioner recommends an annual appropriation of at least \$1,500 to be made from the school fund and to be applied for this purpose, together with any additions from the Peabody Fund, the work of these institutes to be done under the direction of the State board of education.

The Peabody State Institute was held at Atlanta for one month, beginning July 18, 1887. Arrangements were made for both white and colored students, in separate buildings, but with like instruction for each race. The work of the normal classes was well arranged and thorough, and the attendance was large and the teachers enthusiastic.

The twenty-first annual meeting of the Georgia Teachers' Association was held at West Point, May 3-5, 1887. The colored association met at Atlanta May 4, 1887.

ILLINOIS.

This State has two public normal schools supported by the State, and one by county appropriations, of which the State Normal University at Normal, founded in 1857, is the oldest and most largely attended by normal students. This institution includes besides the normal department, high school, grammar, and primary grades in the model department. All normal students have excellent opportunities for observation, instruction in theory and practice of teaching, actual training work, and experimental and practical study of methods for presenting various subjects to children, with special reference to the use of apparatus. The course of normal study occupies 3 years. By a vote of the board of education, all persons who by examination before the faculty show themselves entitled to a first-grade certificate may be received into a class for a year's course, to be devoted exclusively to training, and those so working in the training school shall be entitled to certificates of attendance.

The Southern Illinois Normal University is located at Carbondale, and a new normal building was opened and dedicated February 24, 1887. It was built and fur-

nished at a cost in round numbers of \$152,000, in addition to the foundation of the old building, which was worth \$8,000 additional. This institution has 3 departments: A normal university, with courses of study occupying 4, 3, and 2 years respectively; a preparatory normal course of one year, and a training department. Male pupils who may so desire are formed into a cadet battalion under supervision of a U. S. Army officer, and are drilled at stated times during the week. The pedagogical course of normal study embraces the science and methods of teaching in its application to all stages of education from the kindergarten to the college and university. The instruction is chiefly by lectures, examinations, observations, experiments, and criticisms, somewhat similar to clinics in medical schools.

Cook County Normal School, at Normal Park, has a professional training class and four high school classes representing the usual four grades in an English high school course. Pupils are admitted to the professional training class who have diplomas from colleges and high schools. Three or more years of successful teaching and a first-class teachers' certificate are accepted as equivalent to a diploma from a high school. The professional study includes mental science, pedagogics, history of education, theory and practice of the kindergarten, manual training, elocution and the Delsarte system of expression, technical training in penmanship, drawing, painting, and modelling, with practice teaching one hour daily. The manual training is devoted to moulding in clay and sand, pasteboard work, making apparatus for experiments in physics, and working in wood. The county superintendent holds an institute for county teachers in the normal school during the month of September.

Aurora, Moline, and Springfield report normal training classes for their teachers, and regular institutes and teachers' meetings are held in *Belleville, Cairo, Elgin, Jacksonville, Peoria, Quincy, and Rockford*. In *Belleville* there is also a monthly institute for teachers instructing in the German language.

Institute work in the State is general and usually effective. The *Intelligence* of September 1, 1887, states that "in 1887 an institute will be held in every county of the State for the first time in its history." The *Illinois School Journal* of June, 1887, contains a list of 81 institutes arranged by the State school authorities, beginning in March and extending to September, 1887. These are usually held by the several county superintendents with two or more assistants. A law involving possibilities of reform in county institute instruction was passed in 1887, providing that the teachers in a county can attend their county institute in term time and be paid for 3 days of the time so employed. They are entitled to pay for 5 days in the year, but not to more than 3 days in a school term.¹

Teachers' associations are numerous and held at stated intervals. Besides those of the counties there are State and district associations.

The thirty-third annual meeting of the State Teachers' Association convened at Springfield, December 28-30, 1886. The attendance numbered nearly 500 leading and progressive teachers from every section of the State. The annual meeting of county superintendents was held at the same time and place. The Northern Illinois Teachers' Association met at Aurora, January 28-29; and at Polo, April 29-30, 1887. The Northern Illinois High School Teachers' Association held a meeting April 15-16, 1887, at Hyde Park. The association for the central part of the State held its third annual meeting at Danville, March 25-26, 1887, which was one of the largest teachers' conventions ever held in the State. Four hundred were enrolled as members and paid the fee of 50 cents into the treasury. The Southern Illinois Teachers' Association held its sixth annual meeting at Du Quoin, August 24-26, 1886.

The teachers' reading circle, as a separate and distinct institution, seems to have a sure foothold in Illinois. The large assembly of county superintendents at Springfield spoke with no uncertain voice of the importance of the circle as an agency for improving the schools, and of their determination to foster it and extend its usefulness. The fundamental idea of the Illinois Teachers' Reading Circle is the professional and general culture of its members. Certificates have been given to 838 persons who have completed the first year of the elementary course. A portion of Barnes's General History, Payne's Theory of Education, and Hewett's Pedagogy, with collateral reading, comprised the course for 1886-87. The *Illinois School Journal* for July, 1887, states that the reading for next year has been simplified and consists of Barnes's General History and White's Pedagogy. Full outlines are to be prepared and furnished to all readers connected with the circle, to indicate clearly the important topics to be studied.

INDIANA.

Normal instruction in this State is furnished by the State Normal School at Terre Haute, and other institutions under private management. In addition to these a free training class is reported at Indianapolis, and the system of institutes, teachers' meetings, educational associations, and reading circle work is developing most satisfactory results.

¹ *Illinois School Journal*, July, 1887.

The State school at Terre Haute receives liberal support by standing and occasional appropriations, and its buildings and equipments are of the best quality. The faculty numbers 17 trained normal instructors, while more than 700 pupils were in attendance last session, representing nearly all the counties of the State. The sole object of the school is the professional preparation of teachers for the common schools of the State. With that end in view it provides courses of study of 3 and 4 years in English and Latin, with special courses for high school and college graduates. Tuition is free, and residents of Indiana must promise to teach, if practicable, in the common schools of the State a period equal to twice that spent as pupils in the normal school. A training school of eight grades is attached to the institution.

The Indiana Normal College was organized in September at Covington. This institution reports a faculty of 10 teachers with an enrolment of over 100 normal students. The college building contains ten recitation rooms, an office, a library, and a chapel with seating capacity for 600 persons; with a total valuation of grounds, buildings, and apparatus at \$40,000. The course of study embraces ancient and modern languages, professional normal and training instruction, commercial branches, and instruction in the fine arts. A teachers' training class is maintained for practice work and observation. A valuable laboratory offers advantages in the study of science, and pupils are taught to manufacture most of the necessary apparatus used in experimenting.

The State University has established a course in the "science and art of teaching," the design of which is chiefly to meet the demand for well-prepared teachers for the higher positions in the public schools and colleges.¹

Indianapolis has a training class connected with the public school system, the course extending over one and a half years. *Hagerstown High School* includes mental science and pedagogics in its course of study, and graduates are given certificates to teach after passing the required examination. *La Grange County* requires attendance at township institutes with forfeiture of pay for absence. *Crawfordsville, Frankfort, Michigan City, Richmond, Warsaw, and Washington* have stated teachers' meetings. *South Bend* teachers are allowed a half day each term to visit schools of similar grade for the purpose of observation. *Terre Haute* teachers, in addition to their regular meetings, levied a tax upon themselves for lectures by experienced educators on subjects pertaining to their profession.

Indiana is not backward in the matter of teachers' institutes, having inaugurated such assemblies in 1846, which is believed to be the date of the earliest teachers' institutes in the State. The law of 1865, requiring one to be held in each county at least once a year and making a small appropriation for this purpose, marks the beginning of the institute period. This means of professional improvement has been most effectual in elevating the standard of teaching, popularizing public schools, and fostering among the masses a healthy educational sentiment, besides creating a thirst for knowledge. A list of 61 counties holding institutes from July to November, 1886, is given.²

The thirty-third annual meeting of the State Teachers' Association was held at Indianapolis December 28-30, 1886. County and village school and high school sections were held in connection with the association. The enrolment was the largest ever made, and by the election of a lady as its president, Indiana is the first State to take that step. The Northern Indiana Teachers' Association met at South Bend, March 17-19, 1887, and the Southern Indiana Teachers' Association held its tenth annual session at Madison, March 23-25, 1887.

The Indiana Teachers' Reading Circle was organized in 1884, and is under the care and direction of the State Teachers' Association. This is the first organization to follow the lead of Ohio in establishing a State system of reading circles. The popularity of this movement is evinced by the statement that one-fourth of the teachers of the State, over 3,000,³ are reading the course prescribed, and 32 counties are represented in the examination of 1887. A fee of 25 cents and a pledge to faithfully pursue the prescribed course of study are required for membership. The books for 1886-87 are Green's Shorter History of the English People; Watts on the Mind, for new members, and a part of Brooks's Mental Science for those entering in 1885; with Hailman's Lectures on Education. Examinations are held annually and diplomas awarded to all who successfully complete the work laid out for each of the four years of the course. As indicating the importance attached to this work and the general culture of teachers, the State board of education orders that after January 1, 1887, every applicant for a teacher's license must present to the county superintendent at the time of examination a review or composition upon one of the books in a list which is given, said composition to contain not less than 600 nor more than 1,000 words, in the applicant's own handwriting, with assurance that it is the applicant's original work. The list from which selection is to be made comprises poems, novels, sketches, etc., by classic English and American authors of recent times.

² Indiana School Journal, July, 1886.

³ Ibid., April, 1887.

IOWA.

The State Normal School at Cedar Falls is reported to be in a prosperous condition. Another teacher has been added to the faculty, and a new course of study prepared. This new course comprises, (1) the study for one year of the elementary branches as applied to elementary schools; (2) the study of elective branches the second year to fit students for doing high school work, giving them a review of such studies as they most need. Some modifications are also made in the regular courses to cover the subject-matter required for State certificates and State diplomas.¹

The regular course extends over four years, and includes scientific and didactic study, with professional departments for high school and college graduates. A declaration to teach in the State secures free tuition. The demand for trained teachers is so urgent that many students leave after one year's study, and it is estimated that about 300 teachers annually enter the profession who have received partial or finished training at this school.²

In view of this increasing and imperative demand for trained teachers throughout the State, the board of directors ask an appropriation of \$10,000 for a new building, to contain sleeping apartments and study rooms for not less than 100 students; \$5,000 are asked for a cottage for the president, besides other provision for repairs to old building, increasing the efficiency of domestic arrangements, electric lights, library, and apparatus.

West Des Moines training school is established in connection with the public school system of that city, and is intended especially for the instruction of high school graduates. The course extends over 1 year, and includes the careful study of prescribed authorities, with actual school work. The *Audubon* school board grant the entire corps of teachers a leave of absence of 1 week, to be spent in visiting the *Des Moines* schools. *Lyons*, *Muscataine*, *Oskaloosa*, *Sioux City*, and *Des Moines* hold general, grade, and other teachers' meetings.

The majority of the teachers of the State receive professional training through the medium of the county normal institutes. These have annual sessions of from 2 to 8 weeks, with abridged courses of normal work and study. The importance of these educational agencies may be inferred from the attendance, which has been steadily increasing, until it numbered over 13,000 for the year 1886. The difficulty now experienced in most counties is how to provide accommodations for the large numbers that attend. Review schools have been held in the counties of northern Iowa, meeting from 2 to 4 weeks previous to the session of the normal institute. These schools have for their object a careful and critical study of the elementary principles of the common branches, that methods and their application to the developing mind may be studied to better advantage at the normal institutes.³ During the spring of 1887 short sessions of institutes were held in many counties of the State, which proved of especial benefit to inexperienced teachers.

In the fall of 1886 a large number of district educational meetings were held by county superintendents, and largely attended by teachers and patrons. The requirement of the State law for scientific instruction regarding the effects of alcoholic drinks, stimulants, and narcotics was very generally discussed, and much accomplished towards securing the faithful observance of the law.⁴

The thirty-first annual meeting of the State Teachers' Association was held at *Des Moines*, December 28-31, 1886. The enrolment was 403, being the largest ever made, with one exception. This association prepares a graded course of instruction for normal institutes, covering a period of 4 years. "Schoolmasters' Round Tables" have been organized in various portions of the State, furnishing opportunities for social and professional improvement.

Iowa teachers are fully alive to the importance of professional and general reading as a means for improvement. As an example, it may be mentioned that Superintendent Scott, of *Oskaloosa*, has secured statistics of the expenditures of his teachers for last year's reading in these subjects. The total is \$516.50, or an average of \$24 per teacher. This is a good showing, and indicates wide awake and progressive teachers.⁵

The State Teachers' Reading Circle has marked out a 4 years' course of study on the Chautauqua plan. The reading for 1887-88 covers a broad field and serves as a good foundation for the 3 years' work to follow. The course for the present year consists of mediæval and modern history, mental and natural science, literature, and the United States Constitution. There is a manager in each county, usually the county superintendent, who enrolls members, organizes local circles, and distributes books. The reading circle board reports 51 counties with working circles.

KANSAS.

Kansas has a well-organized State normal school at *Emporia*, with a total enrolment of nearly 750 students, representing 81 counties of Kansas and 16 States. The Legis-

¹ Intelligence, April 15, 1887.

² Iowa State Report, 1886-87, Appendix.

³ Journal of Education, April 1, 1887.

⁴ Report of the State Superintendent.

⁵ Intelligence, October 15, 1886.

lature provided for the erection of a new wing to the already commodious building, which will contain, with the addition, 50 rooms, exclusive of closets and wardrobes, especially adapted to school purposes. The cost of improvements is estimated at \$25,000, with an additional appropriation of nearly \$10,000 for library, apparatus, etc. Tuition in the normal department is free to all regular students, and railroad fare in excess of \$3 is refunded to all pupils from the State. The strictly professional branches are grouped in a single year, the entire course of normal study occupying 3 and 4 years. Pupils completing satisfactorily the first 2 years of the prescribed course are granted teachers' certificates good for 1 year in any part of the State, and the diploma of the school is equivalent to a life certificate. The model department is organized into a graded school, from kindergarten to grammar grades, and in this all students are required to teach during the professional year. For admission to the normal school, first and second grade certificates are accepted in lieu of examination, also diplomas from 34 high schools of the State, while other candidates are required to pass a fair examination in the common school branches. The State superintendent highly commends the important work and beneficial results of the normal school, and suggests that the ends of normal training might be better secured by making the present State normal school a normal university, devoted exclusively to training in the higher departments of normal work. For this purpose branch normal schools should be established, 1 in each Congressional district, in which academic would be combined with normal instruction, thus relieving the normal university at Emporia of all preparatory work.¹

Kansas City High School has a normal course of 3 years, designed especially for the preparation of young ladies to teach in the graded schools of that city. The following cities and towns have regular institutes and teachers' meetings, in some cases the teachers being allowed to visit schools of other teachers for the purpose of observation: *Atchison, Beloit, Concordia, Ellsworth, Emporia, Kansas City, Lawrence, Leavenworth, Ottawa, Paola, Topeka, Wellington, and Winfield.*

For the summer of 1887, eighty-seven normal institutes were appointed. The State superintendent speaks in highest terms of these factors of educational training, and urges continued appropriations for increasing their efficiency.

The twenty-fourth annual meeting of the State Teachers' Association was held at Topeka, December 28-30, 1886. In addition to the State organization, the North-western Association meets at Beloit, the South-eastern Association at Fort Scott, and the South-western Association at Wichita. All of these associations are doing much in the way of stimulating professional pride among teachers and elevating the educational standard of the State.

Kansas has a State Teachers' Reading Circle, with a comprehensive course of study, which receives the support of teachers and others interested in educational matters.

KENTUCKY.

No public State normal school has as yet been established for white students. Provision was recently made by the Legislature for a normal school for colored pupils by appropriating \$7,000 for a suitable building, and \$3,000 annually for its support. Tuition will be free to all colored residents of Kentucky, possessing the necessary qualifications and signing a pledge to teach, as far as practical, in the colored common schools of the State, a period equal to twice the time spent as a pupil in the school. Certificates of proficiency will be granted to those who complete the prescribed course of study, and 2 years' successful teaching after graduation will entitle teachers to appropriate professional diplomas, allowing them to teach in any of the colored common schools in the State.²

The State College has a normal department also for professional training of teachers. Educational sentiment in the State is eminently in favor of such schools for whites, and the establishment of three normal schools is strongly urged, one each for the eastern, central, and western parts of the State.

Normal institutes for the judicial districts of the State are required by law, and many county institutes are also held. Three normal institutes, one for each of the supreme court districts, were appointed for the summer of 1887, with the understanding that at the close of each a district association would be organized to meet yearly at the same place as the institute.³

Louisville.—Normal classes for white and colored students separately are reported from Louisville. At *Newport* the senior principal convenes the teachers twice a month for normal instruction. *Corvinton* has monthly meetings of the teachers' association.

The State Teachers' Association (white) met at Louisville, July 7-9, 1887; and that for colored teachers at Lexington, July 10-12, 1887.

The Teachers' Reading Circle has a course of 3 years' study in history and art, pedagogy, science, and literature. No membership fee will be charged for the year 1887-88, but teachers are expected to register their names with the secretary.

¹ Report of the State Superintendent, 1885-86.

² Common School Report.

³ Lexington Observer, July 16, 1887.

LOUISIANA.

The Louisiana State Normal School at Natchitoches, during the few years of its existence, has become the centre of the public school system of the State. This school is assuming an individuality and independence that promise to make it a prominent institution in the South. Psychology is made the basis of all work in the normal department, and the plan of the institution, as now conducted, is essentially the same as that pursued in the best normal schools of the country. Reviews and methods of teaching the grammar studies, literature, science, civil government, and professional branches are prescribed in the course of studies. To this is added daily exercises in teaching in the practice school. The course of study covers 3 years, and tuition is free. An annual appropriation of \$13,000, allowed by the Legislature, with assistance from the Peabody fund, secures to the school the necessary means for its further growth. The Peabody fund donated \$2,000 to the school and \$1,000 additional for institutes. The State receives 8 Peabody scholarships at the Nashville Normal School. Two graduates from the State are reported in the class of 1887.

New Orleans has a city normal school in connection with the Girls' High School. The course hereafter will extend over 2 years. Daily sessions are held on at least three school days of the week, and on Saturday morning. The annual session must be at least 6 months, and the school is divided into a junior and a senior class. Tuition is free, and teachers holding certificates, graduates of the Girls' High School, and other institutions of equal grade, and applicants who have spent at least 3 years in systematic study after leaving the highest grammar grades of the public and private schools of the city, are admitted after examination. The course of study includes a comprehensive review of the grammar school studies, the Tulane lessons in drawing and physiology, and lectures on other educational subjects by professors of the Tulane University and others. It is proposed to add, from time to time, elective courses of special study. Classes in stenography and Latin have been formed, and it is hoped that means will be found to open classes in book-keeping and solfège.¹ It is recommended that this school receive from the State a support at least equal to that given to the normal school at Natchitoches.

The Southern University at New Orleans is a State institution which supplies the place of the high and normal schools for colored boys and girls. There is also a Peabody normal school for colored pupils, in this city, with a course of 2½ years.

Monroe High School has a 2 years' course, and in both years pupils receive normal instruction. Teachers' meetings are held semimonthly, and the scholars of the high school who receive normal instruction are required to attend.

Teachers' institutes were successfully conducted in this State during the past year, through the liberality of the Legislature and the Peabody fund.

The instruction was carried out under the direction of the president of the State Normal School, and the instructors were all members of the faculty. The institutes continued one week, and were conducted separately for the races. It is recommended that an annual summer normal of 6 weeks be held at the State Normal School.

The annual meeting of the Louisiana Educational Association was held at Mansfield, May 6 and 7, 1887.

MAINE.

Maine has State normal schools at Castine, Farmington, and Gorham, with the Madawaska Training School at Fort Kent and Grand Isle. The course covers 2 years, with an additional year of advanced study at Farmington for graduates of the regular course who may desire it. The common English branches in thorough reviews, with such higher branches as are especially adapted to prepare teachers to conduct the mental, moral, and physical education of their pupils, are included in the curriculum. Tuition is free, and pupils are required to pledge themselves to teach in the public schools of the State for as long a time as they have been connected with the normal schools. Castine, Farmington, and Gorham report model schools. Farmington received an appropriation of \$3,000 for enlargement of the school building.

The Madawaska Training School is designed to educate teachers, in English specially, for the common schools in the French district. The legislative act providing for the school authorizes the establishment and maintenance, for a period of not less than 6 months in each year, of two schools in the "Madawaska Territory," so-called. This training school takes from the schools, existing teachers and some of the best and brightest of the older pupils, and by means of reviews endeavors to give them a thorough knowledge of the elementary branches usually taught in the common schools. The results of this instruction are said to be most gratifying.

Lewiston has a normal practice school which, having been discontinued for a term of 4 years, was reopened in September, 1886. The class numbered 12, and in addi-

¹ Report of Chief Superintendent of Public Schools, 1885.

tion to practice work the pupil-teachers received comprehensive instruction in professional branches. The teachers united and took at their own expense some of the leading educational journals. Monthly teachers' meetings are held, and also grade meetings at times. A teacher's association has been formed for mutual improvement and the formation of a teachers' library, and as a result nearly 200 books have been added to this library. The Chautauqua Reading Circle has also had recruits from the teachers.

Portland has a city training school with a course of one year, and a model school with over 200 pupils. One of the primary schools of the city is utilized for this purpose, having 6 classes of primary grades. The school work has been done by the practice class, with two members in a room for the most part, under the immediate supervision of the principal. General and grade meetings are held in this city, and there is also a teacher's association.

Augusta held seven meetings during the year which resulted in the formation of a teacher's association, embracing the teachers in both the graded and rural schools, and holding monthly meetings during the school year.

There are 18 county teachers' associations in the State, Oxford and Aroostook having 2 each, and the other counties 1. The sessions are from two to three days, and are conducted by the State superintendent.

The annual meeting of the Maine Pedagogical Society was held at Brunswick, December 30, 1886.

MARYLAND.

The State Normal School is located at Baltimore. The law directs that 200 students shall be admitted free of tuition, but the apportionment of two students for each member of the General Assembly brings the number to 234. These students are also provided with English text-books and school stationery free of charge, and must file a written declaration of their intention to teach within the State. Besides the regular appointees, a limited number of students are received, who pay \$50 annual tuition and purchase their own text-books. Such students are not required to become teachers. The course of study extends over 3 years, and includes the usual English branches, without any ancient or modern language. A model school is attached to the institution. The young ladies of the normal school have practical cooking-school experiences.

The Colored Normal School is also located in the city of Baltimore, and has a large attendance. In the normal class there were 30 students, of whom 3 were sent out into the counties to teach. The objection that young persons reared in the city have to the comparative discomfort of such boarding as a colored teacher can secure in a country district will account for the small number of teachers that this school has been able to furnish to the colored schools. It is recommended that a small addition to the usual State appropriation be applied to the travelling expenses of county students who should engage to teach in the counties from which they come, which would enable the colored schools to obtain a supply of well-qualified teachers.¹

An important step in the improvement of the public schools of the State is the requirement by the State board of education that teachers be examined in the science and methods of teaching, and of classifying certificates according to the manner of work performed in the school room.

Caroline County has 3 teachers' associations and a reading circle. *Frederick County* teachers, during the past year, purchased over 200 books on the science and methods of teaching, and subscribed for nearly 100 school journals. *Kent County* held 5 regular meetings of the teachers' county association, with large attendance. *Montgomery County* has quarterly associations for teachers. *Somerset County* has a white and a colored teachers' association. In order to secure competent colored teachers, a colored normal class was organized during the summer, with an attendance of 18 pupils. The session lasted 7 weeks, and the course of study included all the branches required for teachers' certificates. A similar class is announced for next summer. *Talbot County* held a teachers' institute, and also a normal institute for colored teachers, lasting 6 weeks. This class had a good attendance, and began immediately after the close of schools for the summer vacation.

The twenty-first annual meeting of the white State Teachers' Association was held at Old Point Comfort, Va., July 5-8, 1887. There was an attendance of over 300 from Maryland. The colored State Teachers' Association met at Baltimore, June 21-23, 1887.

MASSACHUSETTS.

Normal schools in the United States had their origin in one of the first acts of the board of education of the State of Massachusetts, and the creation of the board itself grew directly out of a public demand that teachers should have better qualifications for their work. The object of the normal schools is to give teachers special training for

¹ State Report.

the responsible work of instructing and managing their schools, and, more especially, to aid them in directing the children and youth committed to their care in securing a correct and natural development of their powers, and in the formation of a well-rounded character. This work the State normal schools are doing well, and those teachers who go forth from them into the schools are, in good measure, improving the character of those schools, and are giving a higher and a more wholesome tone to the intelligence and morality of the rising generation of the Commonwealth.¹

Since the establishment of the board of education in Massachusetts, 6 State normal schools have been established, training schools in many of the cities and larger towns have been added to the system of public schools, and teachers' associations are numerous and well attended. About one-fourth of the public teachers are normal school graduates, and nearly one-third have attended a normal school. Many more have had the advantages of such instruction as the training school can give, and all others have had their ideas and practices modified by the example of those who have been trained in the theory and practice of the best methods.²

The normal schools are improving in the methods of training they practice, and in the results they produce. The present entering classes of these schools are better prepared for a professional course of study than were those of former times. This previous preparation will in time relieve the normal schools of a large amount of academical work which is now required in connection with professional study. The State normal schools are the Normal Art School, at Boston, and normal schools at Bridgewater, Framingham, Salem, Westfield, and Worcester. The school at Framingham is the first State normal school ever established on this continent. In 1838 a member of the board of education and an earnest friend of the public schools, the Hon. Edmund Dwight, of Boston, offered the gift of \$10,000, to be expended under the direction of the board, for the training of public school teachers, provided the State would furnish an equal amount for the accomplishment of the same end.³ The offer was accepted, and on the 3d of July, 1839, the school was opened at Lexington, removed in 1844 to West Newton, and thence to Framingham in 1852, the removal in each instance being caused by the increased demand for accommodations. The school at Westfield followed in September, 1839, and a year later the third school was established at Bridgewater. For nearly 50 years normal school graduates and under-graduates have been entering the ranks of public school teachers in their State.

Two courses of study are offered at the State normal schools, one of 2 years and an advanced course of 2 years additional. The curriculum embraces the usual grammar studies, higher mathematics, natural and mental science, book-keeping, language, literature, didactics, civics, school laws of Massachusetts, drawing, vocal music, and gymnastics. In addition to these subjects the 4 years' course includes advanced studies in mathematics, science, general history, Latin, and French. Greek and German additional is optional with the principal and board of visitors of each school. At Worcester, German may be substituted for French, as the interests of the school from time to time demand. Graduates of the regular course who desire to prepare themselves for the higher departments of teaching are permitted to take an advanced course at some of the schools, occupying 2 years, and including instruction and training in the Latin, French, and German languages, the higher mathematics, and other branches required to be taught in the high schools of the State.

Tuition, and generally the use of all text-books, is free to such students as pledge themselves to complete the course of study and afterwards to teach in the public schools of Massachusetts, irrespective of their place of residence. Those whose purpose is to teach in other States or in private schools are required to pay in advance \$30 annual tuition. Pecuniary aid is furnished by the State to the amount of \$4,000 per annum for the normal schools, which is distributed among the several institutions and given to promising pupils from Massachusetts who are unable without assistance to meet all their expenses. This aid is distributed among the students at the close of each term in sums varying according to the distance of their residences from the school, but not exceeding in any case \$1.50 per week. At the normal school at Salem additional assistance is given from the income of the fund of \$5,000, a bequest of Nathaniel I. Bowditch, Esq., of Brookline.

The Massachusetts Normal Art School was established by the State as a training school for teachers of industrial art. The intention and scope of the school are broad. It aims to fit pupils for two very different kinds of work, namely: (1) To train students to teach and supervise drawing in the public schools; (2) to fit pupils to give instruction in the various branches of study in the evening and other industrial drawing schools. It also aims to provide for high skill in technical drawing, and for industrial art culture. Candidates for admission are examined in the common English branches of study, and in free-hand drawing of ornament from copy. Tuition is free to students residing within the State and intending to teach drawing in the public schools; for others, the charge is \$50 per term. The school offers a 4 years' course of training in the mechanical and artistic branches, and their practical application

¹ State Report.² Ibid.³ Ibid.

to industry, and a 2 years' course of training for the work of teaching and supervising drawing in the public schools. A post-graduate course of 1 year is provided for graduates without payment of fees, on condition that if called upon by the principal they will devote some of their time to teaching in the school.

The normal school at Bridgewater has of late years given increased attention to the study of natural and physical science as related to school work, especially intended to indoctrinate the pupils in those methods of scientific study which may be exemplified in the most elementary work. The institution has 7 laboratories—2 in the department of physics, 2 for chemistry, a mineralogical and geological laboratory, a biological laboratory, and an industrial laboratory—furnished with the approved modern appliances for teaching how to teach and study the physical and natural sciences. This institution reports a "School of Observation," which the students visit to observe the teaching of elementary subjects to children by a model teacher. Physical exercise is provided for by grounds for out-door sports and a pond for skating.

Framingham has a practice school which includes classes of all grades, from the lowest primary to the grammar. The work in this department is an important part of the training course, and occupies from 5 to 8 weeks in the last year of the course. Teaching exercises form a large and important part of the school work at Salem, and during the senior term object lessons are given to classes of primary school children. At Westfield the policy is to advance the standard of graduation from year to year. The most pressing need is a practice school. This need is partially met by frequent visits of the members of the senior class to one of the best of the public schools of the town, and by bringing small detachments of children from the same school into the normal school building to be there taught by the normal school pupils.

The normal school at Worcester has no practice school connected with the institution, but systematic observation of schools and actual practice in teaching, under the joint supervision of the city superintendent and the faculty of the normal school, constitute an important element in the course of training, and is known as the "apprenticeship."¹ The systematic, objective study of children has developed into a regular feature of the school, and its influence in bringing students into close and true relations to children is already apparent. It is the source of a new and fresh interest in the whole aim and object of teaching, and it gives at the same time valuable aid in forming correct habits of scientific observation and induction that may be applied to the pursuit of any object of study whatever. The records of these observations of children, now amounting to several thousands in number, are carefully classified and preserved, and are believed to contain much valuable material for a revised and improved psychology of childhood, that may in the future render important service to the art of teaching.²

Boston.—The work of the Normal School is satisfactorily and judiciously carried on. The course of study extends through one year and is pursued with special reference to teaching. The curriculum embraces mental and moral science and logic, principles of education, school economy and methods of instruction, physiology and hygiene, natural science, study of language, elementary studies, vocal music, drawing and black-board illustration, observation and practice in the training school and other public schools of the city. Tuition is free to residents, \$75 being the annual charge for others. Most of the graduates find employment at once as substitutes, temporary teachers, special assistants, or teachers in the evening schools, and some are fortunate enough to be early called to permanent positions. The normal school is proving more and more its value to the city as class after class adds experience to knowledge.³

Cambridge has a practice school in which all the classes are taught by young teachers under the immediate supervision of a master and a female assistant. The object of this plan is to give the young women of that city, who so desire and have made special preparation for the work, an opportunity to gain experience under conditions favorable to their own success, and without prejudice to the interest of their pupils. Graduates of the English High School or the Latin School, who have also graduated from one of the State normal schools, or from the Boston Normal School, are preferred as candidates for the position of teacher in this school, though other persons of equal attainments may also be elected. The required term of service is 1 year, but teachers may be retained for a longer period. Compensation is paid at the rate of \$150 per annum for the first 4 months, and afterwards at the rate of \$200 per annum. The school contains all the classes of the primary grade with the fourth, fifth, and sixth classes of the grammar grade, the number of pupils being about 450.

Stated meetings of primary and grammar grade teachers respectively are held once in each term, and their schools are dismissed for the purpose.

Chelsea has a system of apprenticeship, with preparatory course, for pupil teachers. From 20 to 25 graduates have been elected to permanent positions, which they have held with more than ordinary success. The disposition of the school board to select

¹ Catalogue.

² State Report.

³ Report of the Board of Supervisors.

grammar teachers from this corps after sufficient experience in the primary schools will do much towards harmonizing the system and strengthening the teaching force.

Fall River has a training school for teachers which is reported in successful operation, both as regards the teaching power of the pupil-teachers and the attainments of the children. The course extends through one year of study, and tuition is free. The model school consists of 6 rooms. The floor-teachers are required to teach about one hour daily in the presence of the pupil-teachers to illustrate what they regard as the best methods of teaching the different branches of study. At other times they have been required to watch the young ladies teach; and at some convenient time afterward to make suitable suggestions to them, looking towards their improvement in all those things which go to make up the faithful and efficient instructor.

Gloucester reports that the training of pupil-teachers in the schools has been entirely successful. The high school is the main reliance for the supply, although the normal schools are well represented. All candidates are required to serve a year without pay, unless they receive an earlier appointment.

Haverhill has a training school, and the advantages derived by the schools from its influence are marked and valuable. The course of study extends over a period of one year and a half, and graduates of the high school are given the preference in admission. Teachers' meetings for grammar and primary schools are held monthly, and teachers of the other grades meet about as often. The teachers of the city have formed an association known as the Haverhill Teachers' Association, which meets monthly.

Lawrence has a training school which is reported to be doing excellent service in the lines of work for which it was established. The subjects are taught on the topical plan, and teaching exercises by the principal and subteachers form a large part of the class work. The course requires one year and a half, and a high school education is necessary for admission to the school. The normal and practice schools are combined, the pupils acting as teachers when not engaged in normal work. The school consists of 7 rooms, 6 of which contain primary and middle grades of pupils, about 300 in all. More than 100 teachers have been graduated at this school since its organization, and 72 are now in service as teachers in the city schools.

North Adams has a training school with one year's course of study. Daily recitations are held under the charge of the principal, in the approved professional branches, and good facilities are furnished for the proper training of those who have the natural qualities and aptitudes of a teacher. Practice in teaching is given, and the training class with other teachers attend the teachers' meetings held alternate Monday evenings. Certificates of graduation are given upon the satisfactory completion of the course, but employment is not insured to the graduates.

Watertown has established during the past year a training school for teachers. Under conditions imposed by the committee, young ladies now enter the schools as pupil-teachers. They act as unpaid assistants, and find their compensation in the example and guidance of the regular teachers and the practice permitted to themselves.

Springfield reports that more than half of the teachers employed in the primary and grammar grades of that city have made special preparation for their work. Appreciating not only the increasing demands of public school instruction, but recognizing that special preparation is as essential to efficient teaching as to skillful work in other professions, the school committee has resolved to give preference, in the selection of teachers, to those having received training at some well-accredited normal school, or who can bring satisfactory evidence of successful work in the profession.¹ The excellent and progressive spirit animating the teachers is manifest by the attendance of about 40 per cent. of the entire corps at the Saratoga School of Methods, besides attendance of many at the National Educational Convention at Chicago, and other educational associations. The benefits obtained from these opportunities, with teachers' reading circles, and the study of professional educational literature, are observed not only in the school work of those who availed themselves of their use, but in a quickening of the general interest in advanced methods of teaching in the schools. The earnestness and industry of a considerable number of the Springfield teachers, and the spirit of inquiry that animates them, is perhaps at this time the most encouraging feature of the schools.²

Adams.—In order to raise the standard of the teaching force without depending upon outside institutions, the superintendent of schools strongly urges the holding of annual examinations for teachers' certificates of two classes, primary and grammar, these to be confined to high school graduates or those who have received an equivalent training. The great need is a training school for those residents who desire to teach, and the demand for teachers is now large enough to make such a measure feasible.

Blackstone.—A course of professional reading is recommended for the teachers of this town, comprising psychology, principles and methods of teaching, and history of education.

¹ Report of the School Committee.

² Ibid.

Braintree.—A large per centum of the teachers employed in this town have received special training, and to further promote professional and general intelligence, and thereby increase their teaching power, the teachers have formed a reading circle, with meetings twice a month. The plan of work, in their line, embraces readings and investigation in the science, art, and history of education, with discussions and illustrations upon important topics.

Brockton.—In order to sustain a uniformity in the work throughout the city, principals' meetings have been held monthly. In addition to these there have been meetings of all the teachers, at which have been considered the methods of teaching, and one meeting specially assigned for the consideration of physiology is worthy of mention as producing valuable results. Besides these, there have been grade meetings for the consideration of questions and methods which apply only to a few teachers.

Framingham allows visits of inspection. *Leominster* teachers met once a fortnight, or oftener, for consultation and instruction, and during the last two terms a majority of them met once a week to read and study the history of education.

Middleborough has had monthly meetings of teachers. *Milford* teachers have formed a reading circle for the study of the history and philosophy of education, and the voluntary attendance at these meetings gives promise of satisfactory results in the future. *Needham* teachers are allowed one day in each term for visits of school inspection.

New Bedford.—During the winter of 1886-87 there was considerable professional activity among the teachers of this city. The Swain Free School offered two courses, in the English language and in Shakspeare's "Twelfth Night," with weekly or bi-weekly lectures, which a large number of the teachers attended. An enthusiastic group were busy with practical work in zoölogy, several local groups followed lines of professional and more general reading, and not a few worked singly in special lines of self-education. Perhaps the most interesting feature was the series of public meetings held about once a month under the auspices of the Chautauqua Teachers' Reading Union, in which there was first a principal address and then a discussion of the subject by others. The audiences were frequently large, and in the discussions leading ministers and lawyers took part with teachers in forming and expressing an intelligent public opinion on educational matters.¹

Waltham.—The school committee of this city accepts as candidates for positions as teachers in all schools below the high school only graduates of normal schools, or those who have had a successful experience in the particular work called for.

Weymouth had teachers' meetings during the year, of unusual interest and conducted chiefly by the ladies, who brought a number of their pupils with them and gave practical illustrations of the methods to be pursued in taking up and developing certain subjects.

As early as 1846 provision was made in this State for teachers' institutes. For several years it has been the policy of the school authorities to hold teachers' institutes principally, or wholly, in the smaller towns of the State. The limited means of these towns oftentimes does not allow them to employ teachers of high qualifications, or of successful experiences, and hence educational meetings being seldom held in them there is a greater need for that stimulus and interest so often experienced for good in larger and more favored communities. During the year 1885-86 few institutes were held, and only such as were invited by local school authorities. The time usually given to that work was spent in visiting the schools of the towns, in holding meetings of the teachers and committees, and in addressing the people on the educational needs of the several localities. The schools of one hundred and fifteen towns were thus visited by the agents of the board in company with the school committees, and on the last day of the visits committees and teachers have been called together for suggestions and instruction. These visits were usually closed by an evening lecture for the people, given by the secretary or agents.

In 1837 the first county teachers' association was incorporated, and since that time teachers' associations have been formed in nearly every one of the fourteen counties of the State, for the discussion of those problems which present themselves in the every-day work of the public schools. These associations holding meetings of not less than one day annually receive assistance from the State.

The forty-second annual meeting of the State Teachers' Association was held in Boston, November 26-27, 1886. The sum of \$300 annually is paid to this association by the State, subject to the approval of the board of education. The twentieth annual meeting of the Massachusetts Association of Classical and High School Teachers convened in Boston, April 8-9, 1887. The eleventh triennial convocation of the State Normal Association was held in Salem, July 1, 1887. The Lady Teachers' Association, of Boston, is a mutual benefit society of teachers for the purpose of aiding such of its members as may be sick. Meetings are held quarterly for business and social purposes, and any one among the 1,100 lady teachers of the city is eligible to membership. The Schoolmasters' Club meets bimonthly at the Brunswick, Boston.

¹Journal of Education, March 17, 1887.

MICHIGAN.

The State Normal School is located at Ypsilanti. The present accommodations are inadequate for the large attendance, and provision is being made to supply this need. Each member of the Legislature of Michigan is authorized by the board of education to appoint two students from his district, who are received free of charge for tuition. Each appointment is good for one year. Students are offered a choice from several courses of study, which have been arranged to meet the demands of the various grades of schools and the needs of the different classes of teachers; but all the courses of study demand an equal amount of professional training and instruction.

The four-years' courses are the scientific, literary, ancient classical, modern classical, Latin and German, and scientific Latin; the three-years' courses are the English, and the special course with music. This latter has been extended to afford instruction in choral singing and in instrumental music. Pupils of the school who receive diplomas from any course are entitled to legal certificates of qualification to teach in any of the public schools of the State. Diplomas of the English course are equivalent to certificates for five years; of the other courses, for life. The practice school connected with the institution includes primary and grammar grades, and has an enrolment of 244 pupils.

Adrian has a training class, for which, from a number of applicants, 4 are selected each year, with special reference to scholarship and fitness for the work of teaching. Both theory and practice receive due attention in the course, which extends over 1 year. Monthly teachers' meetings are held, and days allowed for school visits of inspection.

Bay City has a training school, comprising the primary grades in one of the grammar schools. This department occupies 4 rooms and is in charge of a principal with 6 assistants, chosen from the graduating class of the high school. These assistants serve 7 months without pay and 3 months with pay, and, if successful in their work, are appointed as regular teachers for the following year. A general teachers' meeting is held at the beginning of the school year; principals' meetings and high school teachers' meetings, each monthly; and special meetings at the call of the superintendent. Visiting other schools is allowed.

Cadillac holds monthly teachers' meetings and permits school visits.

Cheboygan, during the fall and spring terms, has classes for normal training when the number of pupils will justify the use of time for that purpose.

Coldwater has weekly teachers' meetings.

Detroit has a normal training class, which is taught in the high school building. The salient features of this class are one half-year's instruction in the science and art of teaching and one half-year's observation and supervision of practice work of the class instructed during the previous half-year. The candidates for the training class are selected by competitive examination from the graduates of the high school and others who have pursued an equivalent course of study. The entire year spent in the training class is probationary, but pupil-teachers who prove efficient and valuable are assured of regular employment and precedence in appointment over members of any subsequent class. It is suggested to return to the original idea of depending on the training class for 80 per cent. of all appointees in the primary and grammar schools, and to add a new feature by the payment of \$10 per month to the pupil-teachers during their 5 months of probationary service.

Fenton.—At the high school a teachers' course of 1 year may be selected from the English course, and the student who completes the studies will be prepared to obtain a first-grade certificate; but it is expected that the student who does this work in 1 year has completed the first years' course of study in the high school. Teachers are allowed one day each half-year for visiting other schools.

Grand Rapids.—The "cadet system" of training teachers has superseded the regular training school for resident graduates of the high school in this city. This plan assigns young persons desiring to fit themselves for the profession as assistants to principals of schools, who supervise their practice work in the lower grades of the school. The city superintendent recommends that these "cadets" be instructed, as a class, in the principles and methods of teaching, and then be required to work them out for themselves; and if the work of a year fails to develop fairly good teachers, they should be dropped altogether from the rolls. A teachers' library has been started in this city. Regular monthly teachers' meetings are held, with grade meetings additional.

Hastings has a teachers' class conducted during the first half of the fall and last half of the winter term. The pupils make frequent visits to primary and grammar departments for inspection. Tuition is charged at the rate of 35 cents per week. An annual teachers' institute of 2½ days is held before the opening of schools in September, and absence from any part of it renders the teacher liable to dismissal. Regular and special teachers' meetings are held additional. A teachers' reading circle has been in operation some time, and receives unbounded praise from the city superintendent for its valuable work.

Howell has a normal class in the fall, continuing 6 weeks. Fifty cents weekly is charged for tuition. Teachers' meetings are held the first day of each term, and thereafter semimonthly during the school year.

Ludington has normal classes during the fall and winter terms for the benefit of high school graduates. Monthly teachers' meetings are held.

Institute work in Michigan is important and popular. The State superintendent reports that the institutes during 1886 rallied a large and enthusiastic attendance of teachers and school officers, and that their work has been, in the main, satisfactory and prolific of good.¹ A manual of institute work is published in the superintendent's report for 1886, which will be found useful in organizing and conducting institutes. The organization and work of the teachers' reading circle is introduced and earnestly recommended as a most important means of the teacher's growth and culture.

The thirty-sixth annual meeting of the State Teachers' Association was held at Lansing, December 28-30, 1886.

Michigan has a State teachers' reading circle. During the year changes were made in the organization of local circles, by which they may be established directly by the State Reading Circle Council whenever five teachers unite in requesting such organization. A payment of the membership fee, 50 cents a year, will entitle to all the privileges of the circle.²

MINNESOTA.

The normal schools of this State are among the best of the kind in the country. Preparatory classes have been abolished, which action was made necessary by the demands of the rapidly growing normal departments. The schools are taught by experienced instructors and are thoroughly furnished with modern appliances and valuable libraries and cabinets for instruction in academic and professional branches. Since the establishment of the first school at Winona in 1860, more than 1,300 pupils have graduated and many partial students have received instruction, who afterwards entered the profession of teaching. The course of study covers 3 and 4 years, except for graduates of high schools and colleges, for whom a professional course of 1 year is prepared. Excellent work is done in natural sciences, both by experiment and individual collection and analysis. *Mankato* has been for several years a United States signal station, and students at the normal school have opportunity of acquiring practical knowledge of the subject of meteorology. The school at Saint Cloud is also connected with the Signal Service Bureau, and work of that kind is made tributary to class instruction in science. Five thousand dollars have been appropriated by the Legislature for the enlargement and improvement of the grounds at Mankato. The school at Winona has a special kindergarten training course, to graduates of which special diplomas are awarded. Candidates holding second-grade certificates are admitted to the normal schools without examination, also graduates of approved high schools and others with equivalent attainments. Other candidates are required to pass a creditable examination in the common branches, and to receive the benefit of free tuition, all pupils must pledge themselves to teach at least two years in the public schools of the State.

Minneapolis has formed plans for a training class to begin in September, 1887, and *Saint Paul* has a training school with a course of one year, which is considered equivalent to the senior year in either course in the high school.

Duluth.—Teachers' meetings have been held biweekly in Duluth, with occasional model class exercises, and opportunity for visiting and inspecting other schools. *Saint Cloud* district has teachers' meetings, and *Saint Paul* has weekly grade meetings and general monthly meetings.

Teachers' institutes are held annually in every county in which there are schools, and the sentiment is becoming prevalent that teachers should avail themselves of these opportunities for improvement.

The State Teachers' Association met in tenth annual session at Saint Paul, December 28-30, 1886.

The Teachers' Reading Circle, with a comprehensive course of study and annual examinations, is a further aid in the professional training of teachers.

MISSISSIPPI.

This State has, as yet, no normal school for white pupils, but two such institutions are maintained for the colored race. By a recent apportionment of Peabody scholarships at the Nashville College, those formerly assigned to Mississippi have been withdrawn. The State superintendent urges the establishment of a State normal school for white teachers, or a chair of pedagogy in the State University, and one in the Agricultural and Mechanical College. A normal course of 2 years has been established at the Industrial Institute and College for White Girls, with free tuition for residents of the State. By law the trustees of this school apportion to each county its quota of scholars on the basis of the educable white girls in the State and several counties,

¹ State Report.

² Michigan School Moderator, Feb. 3, 1887.

and these are admitted into the institution, with all its privileges, for the course of studies selected. The studies of the normal students are first directed so as to enable them to pass the examinations required by the State law. After this, those who remain long enough are carried forward to the study of advanced subjects to prepare them to become teachers in high schools and colleges. A prominent feature of the normal work is the introduction of a well-arranged line of instruction in free-hand drawing and industrial drawing, so that young ladies will be competent to give boys and girls thorough instruction in drawing, in order that these may be able to read designs and plans, and to represent with the pencil any object it is desirable to manufacture. This is intended to produce a large class of educated, skilled workers, and thus contribute ultimately to the general industrial development and wealth of the State.

Private normal schools are reported at Iuka, Duck Hill, Buena Vista, and Troy.

The State Normal School at Holly Springs, for colored pupils, was abolished by the Legislature in 1886, and reorganized and reopened the same year. The standard of admission has been raised, and the course of study covers 2 years. There is a model class taught in rotation by the normal pupils under the supervision of some member of the faculty. Tuition in the normal school is free to students from the State, and text-books are also furnished gratis. Students are required, by way of compensation, to teach at least 3 years in the public schools of the State.

Tougaloo University, at Tougaloo, which is mainly an industrial school, has also a normal department receiving State aid. There is an elementary, and an advanced course, of 2 and 4 years respectively. Tuition is charged at the rate of \$1 monthly. Alcorn Agricultural and Mechanical College trains colored teachers for the public schools; and most of the graduates and some of the undergraduates who are teaching in the State have first-grade certificates under the new school law.

The new education is rapidly gaining ground in this State, and there never was a time in its history when such an interest was manifested in educational matters as at present. Five years ago there was not a normal institute for whites in the State, while now there is one in nearly every county.¹ The law requires teachers' institutes, separate for the races, to be held monthly during the school year. Each county is divided into three institute districts, or a less number, if such a division will not give 10 teachers to each district, and teachers are required to attend, with a penalty for unexcused absence. Superintendent John S. Lamkin, of Pike County, suggests a change in the law requiring the county superintendent to hold semiannual institutes from 3 to 5 days, for the races separately, not longer than 3 weeks prior to the commencement of the school term that follows.² The State superintendent recommends that counties be allowed to employ expert institute managers to hold county institutes of a week's duration prior to the opening of the winter term. A summer normal institute for whites was conducted at Pontotoc for 6 weeks during July and August. At the annual examination of teachers throughout the State, those averaging 95 per cent. receive State licenses for 5 years. The State superintendent suggests that the law be amended so as to provide life licenses for all teachers who, at the expiration of their first, obtain second State licenses and continue regularly in the service; and also that licenses be valid for 2 years when issued to first-grade teachers who make an average of 90 per cent. on the regular examinations.

Jackson.—The city superintendent of schools is required to organize a normal class of teachers, to meet as often as he may deem advisable. *Meridian High School* has a course of theory and practice of teaching in the third year. A normal class of teachers is also organized, similar to that in Jackson.

The North-eastern Mississippi Teachers' Association met at Starkville July 14-18, 1887.

MISSOURI.

The State of Missouri is divided into 3 normal school districts, with State normal schools in each. These are located—for the first district, at Kirksville; for the second district, at Warrensburg; and for the third district, at Cape Girardeau. Saint Louis has a city normal school, and Lincoln Institute at Jefferson City is a State normal school for colored teachers. The revised course of study, constructed with special reference to fitting teachers for the common and high schools, is substantially the same in the three State normals. Embracing precisely the same range of subjects, each school adjusts the course to suit its special wants. The English language and literature, Latin, mathematics, science, history, professional studies, and art are included in the two courses of study. The elementary course occupies 2 years, conferring an elementary certificate which indicates the studies pursued and the grade obtained in each, with authorization to teach in any county of the State for a period of 4 years from date, unless sooner annulled. The advanced course occupies 2 years additional, conferring a diploma which authorizes the holder to teach in the public schools of the State without further examination, until such authority is revoked.

¹ School Journal, November 20, 1886.

² State Report.

To those holding diplomas and teaching successfully 2 and 3 years after graduation, masters' degrees are conferred, after examination, if the prescribed post-graduate course of reading, or its equivalent, be completed. This course includes history, biography, science, poetry, fiction, and professional subjects. Tuition is free at the State normal schools, but all pupils are required to sign a declaration of intention to teach, giving preference to the public schools of the State. Kirksville and Warrensburg have practice training schools.

The Saint Louis Normal School, though intended exclusively for the education of young ladies intending to teach in the public schools of that city, is open to ladies from any section of the country. Tuition is free, and text-books are furnished for use free of charge. Graduates of the high school are admitted to the special course, which requires $1\frac{1}{2}$ years for completion. Applicants who have finished at least 2 years of the high school course take the general course of $2\frac{1}{2}$ years. The number of pupils is limited for the present to 150, and all are required to sign a pledge of intention to teach in the public schools of the city at least 2 years. The course of study embraces the usual English branches, Latin or German, calisthenics, and professional subjects. In the general course instruction is provided for those who wish to become German-English teachers, and who are far enough advanced in the study to converse in German. Diplomas of graduation are given upon completion of the normal school course to those students who have previously graduated from the high school. All other students, upon completing the course, receive certificates of qualification, which, as well as the diplomas, entitle the students to positions in the Saint Louis public schools without further examination whenever their services are needed. Every student of the school teaches for at least 5 weeks, under supervision.

Lincoln Institute, at Jefferson City, originated in a fund contributed by the Sixty-second and Sixty-fifth regiments United States Colored Infantry, when discharged from service in January, 1866. The institution has been a State normal school for a number of years, and receives appropriations commensurate with its needs. The course includes preparatory and normal departments, the latter occupying 4 years. At a meeting of colored citizens of the State, held at Kansas City in January, 1887, it was determined to petition the Legislature for a manual training school and collegiate department in connection with the Colored State Normal School, as at present there is no school of higher grades provided at public expense for colored students.¹

Although normal institutes in this State do not as yet receive State aid, depending on local effort and support, fully one-half of its 114 counties are reported to have made arrangements for these meetings, with prospective sessions of from 1 to 6 weeks, for the summer and autumn of 1887.² The exercises are conducted by county commissioners, or special institute conductors, and year by year the teachers' institutes become more prominent as a valuable factor in preparing teachers for the arduous and peculiar work necessary to success in the school room. Regarding the results of these meetings, it is observed as a noteworthy fact that those counties are making the greatest progress in which successful institutes have been liberally sustained for a term of years, while the poorest schools are found in those counties in which institute work is discouraged and neglected.³

Carthage has monthly teachers' meetings. *Kansas City* has regular monthly meetings, monthly consultations with principals and teachers, and special or grade meetings. *Moberly* has monthly teachers' meetings, with model lessons, discussions, lectures, etc. *Saint Joseph* has a reading circle, which holds weekly meetings after school hours, and has entered upon a systematic study of the elementary principles of mental science. No person is appointed as teacher without satisfactory evidence of some experience in the profession, or of having attended an approved normal or training school for at least one school year. Teachers are allowed two days during the year for school inspection. The Saint Louis Society of Pedagogy was formed for the purpose of discussing the subjects belonging to the science of pedagogy, and the collection of information in regard to the same. Monthly meetings are held from September to May, inclusive, and are open to the public. The work of this society has developed a greatly increased interest in school matters generally, as well as having been productive of mutual improvement in the science and art of education. *Sedalia* has regular monthly teachers' institutes.

The twenty-sixth annual meeting of the State Teachers' Association convened at Sweet Springs, June 21-23, 1887. The colored State Teachers' Association met at Saint Louis, December 23, 1886. There are 4 district associations in the State; 3 of these—the North-west or Missouri Valley Association, the North-east District Association, and the South-west District Association—hold meetings during the Christmas holidays, while the South-east Association convenes in August. The Missouri School of Science and Pedagogy, established in 1884, is a summer school under the auspices of the State Teachers' Association. The object of this school is the further education

¹ Journal of Education, February 17, 1887.

² School Journal, New York and Chicago, September 3, 1887.

³ State Report.

of teachers in science (in its broader sense) and pedagogy. Thus far the teachers who have attended have been of a high grade, but special effort has been made to provide for the common school teacher. The presidents of the State normal schools and other distinguished educators are among the instructors.¹ The Missouri Teachers' Academy, organized in July, 1886, and the Summer School of Science and Pedagogy met in joint session at Sweet Springs, June 24-30, 1887, immediately following the State Teachers' Association.

The Missouri Teachers' Reading Circle has a considerable membership. A fee of 25 cents was charged during the past year. The entire course includes 4 years' reading, 2 in elementary and 2 in advanced work. The course is optional, but the State board urges a regular course. Local circles are recommended. Certificates are awarded to those completing either course.

MONTANA.

Teachers' institutes are the principal agency for the professional training of teachers in Montana. All the counties of the Territory now come under the law requiring institutes to be held once each year in every county having more than 5 organized school districts. These institutes have become very popular with teachers and friends of education, and are wonderfully helpful to teachers. Attendance for the most part is willing and cheerful, and the few who absent themselves because the law does not prescribe a penalty for non-attendance, are those who have little interest in the profession, and who, in most cases, should not be employed to teach at all. The superintendent of public instruction recommends that teachers be required to obtain excuse for non-attendance, with revocation of certificate as penalty for failure to comply with the law.

The Territorial Teachers' Association has become a permanent institution in the Territory. Great interest is taken in the annual meetings, and it is to be regretted that the distance to be travelled, and the consequent expense, keep many away who would otherwise attend. Attention is called to the benefits which would result to the cause of education if some legislative aid were granted to teachers who attend the Territorial Association, such as paying a portion of the mileage. The favors of railroads in this regard receive complimentary notice.

The annual session of the association was held at Butte City, December 28-30, 1886, and is reported as a very successful meeting. Among the resolutions adopted as recommendations to the Legislature on needed changes in the school law, was one asking that power be granted to the Territorial superintendent to issue Territorial certificates to all whom he shall find qualified to teach, on personal observation, or after personal examination by himself, or deputy appointed by himself, said certificates to be of two grades, valid for 5 and 10 years, respectively, throughout the Territory.²

NEBRASKA.

The State Normal School at Peru is reported in a most flourishing condition, and with its added facilities and the liberal legislative appropriations, it stands upon a footing surpassed by few schools of like character. There is pressing need for two additional normal schools. Though the present building was doubled in capacity one year ago, there is now scarcely room for those in attendance. The increase of pupils during the past 5 years has been more than 200, or nearly double, while the average attendance has increased in even a greater ratio. Thirty-nine counties of the State were represented in the school last year.³ An elementary course of study, occupying 2 years, is designed to prepare teachers for the common ungraded and lower grade schools. At the completion of this course a certificate of qualification is granted, which is equivalent to a second grade State certificate valid for 2 years. A higher course of 3 years' additional study is provided for those intending to become strictly professional teachers, and to prepare them for any educational position to which they may be called. Besides the common English branches taught in the elementary course, higher branches are included, with advanced professional study. Graduates of the higher course receive a diploma which is valid for 3 years as a State certificate of the first grade, and any graduate furnishing satisfactory evidence of success for 2 years will be granted an additional diploma, equivalent to a first grade State certificate for life. Tuition in the regular courses of the school is free to all students. Provision has been made for admitting students into a preparatory department and elementary classes, which will be mainly taught by members of the advanced classes in the normal department under the eye of trained instructors.

Hastings held regular and special teachers' meetings, and 2 half days each year are allowed for school inspection.

Lincoln has a general meeting of teachers at the opening of the school year, and also grade meetings and others during the term.

¹ State Report.

² Report of Superintendent of Public Instruction.

³ State Report.

Teachers' institutes have proved of greatest value, and the growth of the work has been phenomenal. The clause in the law giving the county superintendent power to revoke a certificate for refusal to attend the institute has proved most efficacious. A more systematic and uniform course of study is desirable.¹ Of other educational helps, county associations of teachers, district associations, educational columns in public journals, and the reading circle organization, have been most prominent. Forty-two counties have associations and report 219 meetings. These are devoted to discussion of educational problems, methods of work, lectures, and exhibits of school work, etc. Three district organizations have been formed, in the south-eastern, central, and northern parts of the State.

The State Teachers' Association held its annual meeting at Lincoln during the spring of 1887. The Northern Nebraska Teachers' Association met in winter session at Norfolk, December 28-30, 1886. The South-eastern Association met at Beatrice during the fall of 1886.

The State Teachers' Reading Circle is subdivided into county circles, which may again organize local reading classes. An annual fee of 50 cents is charged. The course of reading occupies 2 years and consists of professional subjects, history, science, and general literature. Thirty-five counties are reported as having circles, with a large membership. The historical and professional courses appear to give the most satisfaction.¹

NEVADA.

The State Superintendent, in his biennial report (1885-86), renews his former recommendation that a normal school be established in Nevada. He suggests a normal class in the State University; or, since there is little demand at present for a university, while there is an immediate and almost imperative demand for a normal school, let the university itself be converted into a normal school, and the proceeds from sale of lands for the university be devoted to the support of the normal school.

The State Teachers' Institute has exercised a potent influence upon the cause of education in Nevada. In July, 1886, two sessions of the seventh annual institute were held, one at Reno, July 27-30, and an evening session at Carson City, July 31, 1886. Ninety-three teachers were enrolled at this meeting.

The State board of education is now authorized to grant State certificates, educational diplomas, and life diplomas. The issuance of these State credentials to teachers has elevated the profession in Nevada, and is now generally approved by the people. Under this law, also, upon the recommendation of the county superintendent where the applicant lives, a first-grade county certificate may be made valid in any county in the State.¹

A new law, understood to be an experiment, provides that on and after the first Monday in January, 1889, district attorneys, in addition to their other duties, shall be *ex officio* county superintendents of schools.²

NEW HAMPSHIRE.

The New Hampshire State Normal School is located at Plymouth. The prescribed course of study is completed in 2 years, and includes the English language and literature, mathematics, natural science, professional study, history, civil government, etc. A model school is connected with the institution, and training in teaching, beginning the first year, increases in amount with successive terms, according to the pupil's preparation for it by study of principles and methods. Tuition is free, and all students are required to declare their intention to teach.

Manchester has a city training school which requires of candidates for admission graduation in some high school, or an equivalent. The regular course of study for those intending to become primary teachers is 1 year; and an advanced course of 6 months is further required of those desiring to teach in the higher grades. Pupils in the training class are paid at the rate of \$10 per month after 6 months, and \$20 per month after a year's service for actual work in the school. In the selection of teachers graduates of the training school have the preference, if equally qualified. For several years more than 50 per cent. of the corps of lady teachers of this city has come from the training school, and this year it was 71 per cent.

Dover has a teachers' library which has proved of great value. The city superintendent urges very strongly the establishment of a training school.

Portsmouth had frequent and stated meetings of teachers, and in addition there has been a weekly class in psychology. The necessity for trained teachers has been recognized to some extent by requiring inexperienced teachers to go about among the schools for three months and observe the methods. A class of pupil teachers was organized near the beginning of the autumn term, several members of which are rendering efficient service.

Annual teachers' institutes are required by law to be held in each county, the expenses being defrayed from the proceeds of the sale of State lands. Manchester

¹ State Report.

² Journal of Education, November, 1887.

reports, early in 1887, the largest and most successful institute held in the State. The registered teachers in attendance numbered 213. A State teachers' institute was held at Exeter, March 23-25, 1887.

The thirty-third annual meeting of the State Teachers' Association was held at Concord, November 4-5, 1886.

NEW JERSEY.

The New Jersey State Normal School is located at Trenton. This institution stands high in value and importance to the cause of education in the State, as is shown by the fact that so many schools are under the superior discipline and teaching of those who are graduates of the State Normal School, and that so many of its graduates are now applied for and sought to fill the places of teachers in the public schools of the State. The course of study is constantly kept at the line which will enable those perfecting themselves for practical teaching to advance in the knowledge of the science of teaching, step by step. All known methods of imparting instruction which are really useful and advantageous are adopted, but nothing is allowed to interfere with the long-practiced, thorough mental drill, which is the daily, hard, plodding, and severe work of teachers and students.

Two courses of instruction are offered, one extending through 2 years and the other through 3 years. These courses include the usual English branches, book-keeping, music, drawing, natural and mental science, history, literature, algebra, and geometry, with professional instruction and pedagogics. Lectures upon subjects connected with school work are delivered before the schools during each year, as well as lectures upon other topics of interest to young ladies and gentlemen. In the model school attached to the institution the normal classes have opportunity for exercising their talent and ability by active work, practically applying and testing their knowledge, capability, and fitness as teachers in the common schools. During the last five months of their course of study in the Normal School the members of the graduating class are required to teach in the model school.

Applicants for admission to the Normal School, who have successfully pursued the whole course of study prescribed by the county superintendent, upon the recommendation of the superintendent, are admitted without examination to the first year of the elementary course. Tuition is free to those intending to teach in New Jersey, and students must sign a declaration of intention to teach for at least 2 years in the public schools. Students in the model and Farnum Schools are admitted into the Normal School upon the certificate of the principals of those schools as to their fitness for admission. The model school connected with this institution, having boys and girls' departments separate, besides including all the primary, grammar, and high school grades, offers special courses for business and preparation for college.

The Farnum Preparatory School at Beverly is intimately associated with the State Normal School in the work of preparing teachers for the public schools of the State. Pupils desiring to enter the preparatory class for teaching, and found qualified in the required studies, must sign an agreement to enter the Normal School to finish their training upon leaving the Farnum School. Pupils graduating at this school are received into the State Normal School without further examination.

Jersey City has a normal training course which is taught during the second term of the senior year in the normal and English course at the high school. This term is devoted to pedagogical work, mental and moral science, history and science of education, methods of teaching, and school economy. At the end of the senior year the students graduate with their class and receive diplomas from the high school. A post-graduate course is then required during which the work of the class consists of observation, teaching classes under supervision, practice in charge of a particular class, practice in as many grades as possible other than in the practice school, and particular study of the management and the working machinery of large schools. At the close of the post-graduate course pupils receive diplomas from the training school and are eligible to serve as monitors. Nearly all of the new teachers in the city schools are graduates of the high and training schools, though graduation at the training school implies no obligation of employment. All examinations for increase in salary when the teachers have completed their terms of service in a lower grade of salary, are held largely upon the theory and practice of teaching. This city has a teachers' association and a reading circle, and visits of school inspection are permitted.

Newark has a city normal and a training school. The superintendent of schools reports the work done in the training class as very satisfactory. More room is needed for both the normal and training schools, and it is recommended that the course be extended to 2 years, and also that a kindergarten class be organized as part of the training course. The course of instruction consists of 1 year in the usual professional studies, and in addition each pupil in the normal school is required to spend at least 8 weeks in practical class room work in the training school, under special direction of the city superintendent, principal of the normal school, and principal of the training

school. No pupil is admitted to the training school without a certificate of graduation from the high school, or upon examination equivalent to the high school course. Non-resident pupils are admitted upon payment of tuition fees determined by the board. All pupils entering must sign a written declaration of intention to teach in the schools of the city, if desired. Diplomas of graduation are given, which are also certificates of qualification to teach. Three teachers' institutes of 3 hours each are held during the year for primary teachers, and for teachers of grammar, high, and normal schools respectively.

Paterson has a normal training school with a course of 1 year's study. The entire year is devoted chiefly to class work and practice, with the constant study of methods of teaching. Provision for manual training is reported as about to be made at this school.

Union County has a teachers' association, with four meetings annually.

The teachers and school officers of the State, at a meeting in Trenton in 1887, organized a New Jersey Council of Education, to be composed of 48 members, divided into 3 classes, serving periods of 3 years each. The membership is to be limited to those engaged in professional school work, of recognized standing as educators, residing or teaching in New Jersey. Two regular meetings are to be held each year to discuss educational topics, disseminate information bearing on these topics, and consider and recommend means of advancing educational interests.¹ The State Teachers' Association met in twenty-ninth annual session at Trenton, December 28-30, 1886.

State, district, and local teachers' reading circles are enthusiastically supported in New Jersey, except in county districts where bad roads and unfavorable weather prevent gatherings. The State circle has a membership of nearly 2,000. The course of reading for the second year (1886-87) comprises four books from a selection of professional works, history, mental science, Swinton, Hawthorne, Irving, and the Chautauquan. Plainfield is the headquarters of the Chautauqua University, which includes the Chautauqua Literary and Scientific Circle and the Chautauqua Teachers' Reading Union, both of which organizations have enrolled many teachers throughout the United States.

NEW MEXICO.

Efforts have been made from time to time to organize the educational forces of the Territory into an effective union. Circumstances, however, were unfavorable until last fall, when the Presbyterian Board, the American Missionary Association, and others, impelled by the wretched condition of public schools, determined to attempt an organization. This effort was cordially aided by the Governor and other public officials, and resulted in the formation of the Educational Association of New Mexico. The first meeting was held at Santa Fé, December 28-30, 1885, and proved a decided success. Important educational topics were discussed, papers read, and class exercises conducted in the presence of the assemblage. An interesting feature was an exercise in numbers by a class of Apache Indian girls, who, previous to last September, had never been inside of a school-house and did not know a word of English. A committee was appointed to urge upon the Legislature needful changes in the school law.²

NEW YORK.

The normal schools of this State, although doing most excellent work, are totally inadequate to supply the pressing demand for trained teachers. These schools as now operated do not fill one in ten of the vacancies occurring in the ranks of the 30,000 common school teachers of the State. The system of teachers' training classes in high schools and academies is doing something to meet the needs of the service in some of the cities and villages, where those classes have the advantages of actual practice as well as of instruction in methods, but in the greater part of the State, outside of these favored localities, the need of well-trained teachers is not properly met.³

Under the present laws of the State the normal school system has little or no organic connection with the public school system, or with the systems of secondary and higher schools supervised by the regents of the university. It is recommended that the laws be amended (1) so that regents' certificates and pass-cards could be accepted by the normal schools for their face value, and (2) so that union schools and academies could establish courses of study approved by the local boards of the normal schools and by the superintendent of public instruction, and pupils holding diplomas from those courses of study should be admitted without examination into the normal schools of the State, to enter at once upon professional work, which would enable those students to be graduated from the normal schools in a year from the time they enter. All the union schools, high schools, academies, and seminaries of the State would thus become

¹ School Journal, New York City, July 16, 1887.

² Journal of Education, February 10, 1887.

³ State Report.

intimately related to the normal schools, and permit these to attend more rigidly and uninterruptedly to their peculiar province of professional work.

New York stands next to Pennsylvania in the list of States having normal schools. There are nine State institutions of this character, located at Albany, Brockport, Buffalo, Cortland, Fredonia, Geneseo, New Paltz, Oswego, and Potsdam. The school at New Paltz is the latest addition, having begun operations in February, 1886. A new school has been sanctioned by the State authorities, and has elected its officers and undertaken preparatory work on buildings at Oneonta.¹

In order to meet the necessity for some normal instruction among the large class of young persons desiring to teach, but who can not afford the time or expense of a normal school course, the superintendent suggests a normal institute lasting from 4 to 8 weeks in any county where a suitable number of such persons might indicate their desire for such instruction. It is estimated that from 3,000 to 4,000 teachers in the common schools drop out every year, and their places are supplied by as many more without previous experience, nine-tenths of whom have no adequate preparation for the responsible work which they are taking up. The necessity of taking steps which will at least show them how little they do know and give them some realization of the need of better preparation, and then start them in the way of securing it, is pressing.²

The courses of study at the normal schools vary in length. Albany has a 2 years' course, New Paltz 2 and 3 years, and the others 2, 3, and 4 years' courses. The studies required for a diploma authorizing the holder to teach in the public schools of the State consist of the usual grammar studies, higher mathematics, natural and mental science, civics, English literature, ancient history, didactics, drawing, and vocal music, with practice work. All the schools teach these studies, most of them having in addition classical and scientific courses. In the normal course proper only English is taught, with ancient and modern languages in the classical and scientific courses. Model training departments are reported at all the schools, with grades ranging from kindergarten through primary, intermediate, and advanced departments. The normal schools are practically open to any properly qualified and duly appointed candidates who may desire to avail themselves of such advantages. Persons desiring to attend consult the school commissioner of their district, and his recommendations are made to the State superintendent of public instruction, whose approval constitutes an appointment. Entrance examinations are required of all students. Tuition and the use of all text-books are free, and the amount of fare necessarily paid in coming by public conveyance to the school is refunded to those who remain a full term. Normal students pledge themselves to teach in the public schools of the State for as long a period, at least, as that spent in the school. Appropriate diplomas are offered on the satisfactory completion of each course of study, which serve as licenses to teach in the public schools of the State.

The Normal College of New York City reports an enrollment of 1,620 female pupils, with 66 instructors, being the largest normal school in the United States. The demand for admittance has been so great that a rule was passed limiting the number of admissions to 600 in any one year. In the admission of students it was deemed wisest to institute a purely competitive examination and admit the 600 in the order of merit, without regard to any fixed per centum, except that no candidate could be admitted unless she answered three-quarters of the questions proposed. A high standard, however, with comparatively easy questions was established, but the result proved a disappointment. It was subsequently determined that the entrance examinations should consist of comparatively difficult questions, and to admit all who received an average of seventy-five. Of the total number of graduates since the establishment of the college (3,700), about one-half are now doing good work in the common schools of New York City, in which they occupy all positions from that of the lowest primary teacher up to that of principal. When deaths, marriages, and removals from the city are taken into account this is an excellent showing, and clearly proves that almost all the graduates sooner or later obtain positions.

The course of study covers a period of 4 years, and tuition is free to all students. The instruction is comprehensive and thorough, and includes, in addition to the studies in English, Latin, French, German, history, higher mathematics, drawing, music, natural, mental, and moral science, with methods of teaching and practice in the training department during the last two years. In the two modern languages, French and German, the work has been so thoroughly done that there is now no difficulty in obtaining graduates well qualified to instruct children in the common schools in these subjects, and thus dispensing with the services of special teachers. Special mention is also made of the marked success achieved in the department of free-hand drawing and original design. Beautiful work has been done by the graduates, which some of them have sold for fair prices.³

¹ School Journal, New York City, October 15, 1887.

³ Report of the President.

New York City has a teachers' mutual benefit association, which received in June, 1887, a donation of \$3,000 from a friend of the cause. Hereafter one-half of the receipts of this association are to go to retired members, women that have taught for 35 years and men that have taught for 40 years.¹

Albany has a teachers' training class, which has become an indispensable adjunct to the system of schools in that city. The city superintendent reports that the good effects of the training school are felt to-day in every school room in the city; for, aside from the direct benefit given to its graduates, the principles and methods inculcated have permeated the whole corps of teachers.² The school was organized for 2 terms under the direction of the office of the regents of the university, who appropriated the customary amount of \$500 for maintaining the class. The certificate of that body is issued to the graduates. The course of study extends through 1 year, and there is practically no instruction in subject matter, the whole time being given to the theory and practice of teaching. The instruction for the past year included music, drawing, school economy, and civil government, United States history, and physiology for members of the class who had not passed the regents' examination in these studies, with methods in primary branches. Each member of the class has given lessons in the class on assigned subjects, and has observed 1 month and taught a number of weeks in a primary and a grammar school designated for the purpose. All the members of the class have voluntarily given extra time to teaching in the preparatory class of the primary school in periods of from 1 week to several months, thus exhibiting a commendable desire to obtain all the benefit possible. Tuition is free to residents of the city, while others are charged \$75 annually.

Meetings of teachers for the purpose of discussion and mutual improvement have been held regularly during the school year, to the great advantage of all who attended.

Brooklyn has a training school, occupying 4 rooms in one of the primary schools of the city, which constitutes the model primary school. One year's course of study is devoted to strictly professional subjects, reviewing only the elementary studies, and doing this for the purpose of exhibiting improved methods of instruction. The work of the pupil-teachers embraces, first, the study of the principles of education, school government, and methods of instruction; second, the observation of work done by the model teachers in the primary classes; third, actual experience in teaching, each pupil-teacher being required to successfully instruct a primary class for at least 10 weeks before receiving a diploma. Tuition is free, and only holders of "B" certificates are admitted to the training school as pupil-teachers. These certificates are granted after examination in the grammar studies, with algebra, geometry, astronomy, and natural philosophy. Graduates of the training school may be appointed to any primary grade, and their experience in the training school shall entitle them to be credited as having had 2 years' experience as teachers in the public schools. Although the pupil-teachers have no guarantee of an appointment upon the completion of their course in the school, yet the number seeking admission is larger than can be admitted, and those in attendance seem to be controlled by a single purpose, that of properly fitting themselves for positions as teachers.³

The city superintendent is required to call the principals of the schools together at least twice in each year for the purpose of consulting with and directing them in the discharge of their duties, and he has also authority to call heads of departments and teachers together at such times and places as he may think proper for the purpose of instructing them in the principles and methods of teaching. There is a teachers' association in this city.

Rochester.—Regarding the normal class in this city the superintendent says: "A sufficient number of those who have received training class diplomas have already been employed in our schools to give opportunity for judging of the practical results of this preparatory training; and facts prove, what reason would indicate, that the average graduate of the training class gets an intelligent hold of her work in very much less time than was required by those of equal scholarship and ability who used to enter the teacher's calling without any special preparation."³ A more extended notice of this training class is found elsewhere. The only certificates now recognized by the school board of this city, besides those issued to graduates of the training class, are New York State College and Normal School certificates.

Syracuse training school admits only graduates of the high school, or others having had equal literary advantages, the required standard being 75 per cent. upon the entrance examination. The course extends through one school year, and is divided into two terms' work. The first term comprises a course in history, mental philosophy, methods of teaching arithmetic, geography, language, history of education, with something of practice in teaching. The second term's work comprises more fully the theory and practice of teaching with the study of methods. The practice of teaching is under the criticism of the training teacher, and is thorough. The philosophy and

¹ New England Journal of Education, June 16, 1887.

² Report of the City Superintendent.

³ Annual Report.

history of education is continued and applied. At the end of the course the candidates are examined upon these subjects and upon their ability to handle classes and conduct recitations. To all who are able to stand the required test the board of education grants certificates of qualification to teach in the city schools. Tuition is free to residents, and others are charged \$34 annually. At present not less than from 25 to 50 per cent. of the teachers in the city schools are graduates from this training school.¹

Monthly teachers' meetings were held according to regulations during the year with more than customary regularity in attendance. The meetings have usually been interesting, and such topics have been considered and discussed as should call for earnest consideration of every one engaged in teaching. During the year teachers have had the privilege of listening to five or six addresses from prominent men engaged in work similar to their own, and of participating in the discussion of those topics which are intimately connected with the every-day work of the school room. This feature of work has existed from the beginning of the city organization, and has been an important aid in building up the school system, and in unifying the work of the various schools and departments.¹

Appropriation is provided by law for the instruction in academies and union schools in the science and practice of common school teaching. Each scholar instructed for the full term required by law in such classes, who has passed the preliminary examination and also the final examination prescribed by the regents of the university, is considered competent to teach in the common schools of the State. A testimonial is granted to such a student, which, when endorsed by any school commissioner, constitutes a certificate to teach in the district for one year, which certificate, at successive expirations thereafter, may be re-endorsed and made valid for a period not to exceed three years after each endorsement.

Auburn.—Theory and practice of teaching is an elective study in the fourth year at the high school. *Canandaigua*.—Provision is made in the academical department for a normal course of one year, with free tuition to non-resident pupils. *Corning* has monthly teachers' meetings. *Gloversville* had monthly teachers' meetings and also a teachers' association for reading and discussing standard educational books and for the study of English literature. *Ithaca* has general teachers' meetings on the first Saturday of each school year, and at other times thereafter.

Jamestown.—The Jamestown Union School and Collegiate Institute has a special normal department, which is organized at the opening of the fall term. The course of instruction consists of lectures semiweekly by the superintendent and class recitations in those subjects required by the regents. Three terms are required to complete the course, two terms for those who have taught one or more terms successfully. Twenty-five members of the class will receive their tuition free for one term. Students completing the course of instruction receive teachers' diplomas of the first or second grades according to qualifications. At least twelve teachers' meetings are held each term, at which all the teachers are required to be present. *Kingston Academy* has a normal class, taught during the fall and winter terms. *Lansingburg* had teachers' meetings averaging two a month; also a local teachers' association, which met monthly for class work and discussion. Two meetings of the Rensselaer County Teachers' Association were held, and the schools were closed during institute week. *Newburg* held general monthly teachers' meetings, and also monthly grade meetings. *Oswego* has general teachers' meetings during the first week of each term. *Rome Free Academy* has a teachers' class, the State paying for the instruction of all the members. Teachers' meetings are held monthly. *Saratoga Springs* has a training class with daily practice in actual teaching throughout the year. *Troy* has monthly teachers' meetings for primary, intermediate, and grammar grades separately, and also general meetings, with attendance obligatory on the part of the teachers, and the forfeiture of one-half day's pay for absence from any meeting. The teachers of each school are required on one day in each term to visit other public schools of the city, and to send a written report of their observations to the superintendent within one week thereafter. *Utica Academy* has a 2 years' normal course, with certificate of the studies pursued. Frequent teachers' meetings have been held during the past year, and all teachers are required to attend the meetings of the Utica Teachers' Association, as well as meetings called by the superintendent. *Watertown* held 63 grade meetings for teachers during the year. *Yonkers* has monthly as well as occasional teachers' meetings.

The institute work in the State is one of vast importance. Although difficulties in the way of organization exist, no other plan has been suggested for keeping the great body of teachers up to the front in methods of instruction. For more effective work the State superintendent proposes to change from county to district institutes, and hold but one a year; insist that every school in the district shall be closed while an institute is in progress, teachers required to attend and promptly paid during such attendance; adapt the work as far as possible to the needs of the particular district,

¹ Report of the City Superintendent.

and distribute a programme of the same to teachers 2 weeks before the institute; supply the best and most practical instruction possible, and bring the normal school faculties into active coöperation in institute work, thereby securing their invaluable aid and leading them to a fuller appreciation of the needs of the system.

The forty-second anniversary of the State Teachers' Association was held at Elizabethtown, July 6-8, 1887. The second annual session of the State Association of Academic Principals convened at Syracuse, December 23, 1886. The State Association of School Commissioners and Superintendents met in the same city, January 19-21, 1887.

New York has a State teachers' reading circle which was determined on at the meeting of school commissioners and city superintendents in 1885-86. This circle is reported to have formed subordinate circles in most of the counties of the State, teachers in large numbers pursuing the prescribed course of reading, which extends through three years, and relates to the history, science, and art of teaching and of school government.¹

NORTH CAROLINA.

The University of North Carolina has a limited normal course of three months, to which teachers are admitted without tuition by recent act of the Legislature. Connected with the city schools of Charlotte is a training school, from which most of the teachers are chosen. Raleigh has several private schools with normal departments, and teachers' meetings are held at stated intervals during the school year. The aid from the Peabody fund has done much to create a healthy public sentiment in favor of public education. The scholarships at the Normal College at Nashville are eagerly sought after, North Carolina receiving fourteen. Six students graduated in the class of 1887.

State normal schools for colored pupils are established at Fayetteville, New Berne, Plymouth, and Salisbury. The normal course covers three years, during which the pupils receive training in the art and methods of imparting instruction in the several branches of study taught in the public free schools of the State. The curriculum includes the common English branches, book-keeping, Latin, history, literature, science, algebra, geometry, and theory and practice of teaching. Tuition is free to all residents of the State, and the text-books required are furnished as far as possible from the school library without charge. Salisbury reports a model department with 33 pupils last session.

The professional training of teachers is chiefly through the agency of State normal institutes, called "normal schools," which have annual sessions of several weeks. The State appropriates \$4,000 for each race, there being eight schools for white and five for colored teachers. The State superintendent urges the necessity for a regular normal college for white pupils, to be so conducted as to allow the professors time to hold county institutes from two to three months every year.² A State colored normal institute of 10 weeks was held at New Berne in the summer of 1887, with an attendance of 80 in normal and secondary grades. More than the usual number of county institutes are reported, and the impression seems to be gaining ground that the county institutes are worth more to the State than are the normals.³

The North Carolina Teachers' Assembly met in fourth annual session at Morehead City, June 14-29, 1887. This meeting was one of the largest and most intelligent assemblages of teachers ever seen in the South, with a membership of nearly 2,000. The object of this assembly is "to enable teachers to meet for discussion of educational questions, to give an opportunity to hear the opinions and methods of distinguished specialists in the various departments of teachers' work, to aid teachers in securing situations, and to afford the means of combined action in obtaining such educational legislation as the best interests of the State may demand."⁴ Meetings are held annually, with fees of \$2 for males and \$1 for females, the fund thus obtained to be used solely in defraying incidental expenses and in securing talented instructors for each assembly. The chief topic discussed at the last meeting was the need of a State normal college for both sexes. The committee appointed to present this matter before the Legislature was continued, with instructions to keep the subject before that body until the school was established. A resolution was adopted to establish a school for the critical study of literature in connection with the assembly. Through the liberality of some special friends of North Carolina education, a building is to be erected at Morehead City for the use of the assembly, and is expected to be ready for the session of 1888.⁵

Teachers' councils have been organized in many counties of the State. The colored teachers met at Raleigh, November 11, 1886, to consider the importance of a State institution for training colored teachers and for the higher education of the colored youth of the State.

⁴ Constitution of the Teachers' Assembly.

⁵ North Carolina Teacher, October, 1887.

The Teachers' Reading Circle has an excellent course in history, biography, literature, and professional study.

OHIO.

There is no State normal school in Ohio. The establishment of a normal department at the University of Ohio at Athens, and the appointment of a professor of pedagogics, is said to be the first thing of the kind ever begun by the State Legislature in Ohio.¹

There are several cities having training classes, and a number of private institutions which offer professional instruction for teachers.

The course of study at the Cincinnati Normal School has been extended to 3 terms, covering a period of 1½ years, or 15 school months. The subjects include the usual professional studies, with practice teaching under critic-teachers during the second and third terms in the practice department of the school. A course in German is offered in which the pupils receive the same instruction in the department of theory as the English pupils, with the exception of one hour a day, which is devoted to the study of theory in German.

The subjects considered are pedagogics, including didactics, discipline, and methods of teaching German in the several grades, attention being given to German grammar and composition and methods of teaching these branches; German literature, including history of the German language, some of the most celebrated authors, their lives and writings; German educators and their methods. The pupils in the German course have practice also in the four grades of the practice school.

Tuition is free to residents of Cincinnati, who must be graduates of the high schools or pass satisfactory examinations in all the branches included in assistant teachers' certificates, the theory and practice of teaching excepted. Non-residents are charged an annual fee of \$40. Pupils who complete the course of instruction and training and pass satisfactory examinations receive certificates of graduation which entitle them to preference, other things being equal, for positions as teachers in the public schools of the city.

Cleveland has a training school for graduates of the high schools of that city or some other academic institution of equal grade. Regarding the value of this school the city superintendent says: "There can be no question that the training school has strongly tended to raise the average level of general culture and of professional ability of the teachers." The course of study extends over 1 year and comprises history of education, mental and moral science, and school management, with review studies, to which constant attention is paid as to the methods of teaching the various subjects. Practical work is provided for all students under the direction of practice teachers. Instruction in German is provided for pupils who have graduated in the German course in the high schools, which is provided for pupils of German speaking parents. Practice is likewise afforded in the German department of the model school. Tuition is free to residents, while others are charged an annual fee of \$40. The graduates of the training school do not have preference over others in appointments to schools. There is a pedagogical society in this city holding regular monthly meetings from October to May.

Columbus has a normal school which consists of a separate department of one year with two divisions—a department of theory and a department of practice. A class of 13 female pupils is reported at the normal school for 1887, of whom 11 received diplomas at the end of the course. There are 3 practice schools connected with the normal school, and each normal pupil taught 10 weeks. Tuition is free to resident graduates of the high school and others of equivalent qualifications, who pass satisfactory examinations and declare their intention of becoming teachers—to teach, if practicable, in Columbus schools for three consecutive years, provided their services are needed. Non-residents of the city pay a tuition fee of \$40. A diploma from the training school exempts the holder from further examination, provided the person has reasonable success in teaching and governing a school, and the term of service is understood to be for a consecutive number of years. Graduates of the normal school have no preference in appointment over others of equivalent qualifications. Separate teachers' meetings are held for English and German teachers.

Dayton Normal School continues to do excellent work in indoctrinating true theories of education and modes of teaching, and in the arts of management suited to the grades for which the young ladies are trained, and in which they have opportunity to practice. The minimum course of study covers a period of 1 year, and tuition is free. The practice rooms consist of a first grade room and a mixed second and third grade room, and in immediate connection there is a German room of first, second, and third grades in charge of a regular teacher. Dayton teachers held a social meeting once a month, and for the literary part are studying Ohio history.

Geneva Normal School offers a special teachers' course, and if desirable, students can study the languages and higher mathematics in the regular classes.

¹ School Journal, December 11, 1886.

² Report of the City Superintendent, 1885-86.

Steubenville has a normal and training school in which each pupil takes turn, 1 month at a time, in the training school, which consists of 2 rooms in charge of the training teacher. The pupils are detailed in alphabetical order, and are on duty about three times during the year. The minimum time for completing the course in the normal and training school is 1 year.

Zanesville has a normal school with a course of instruction in both theory and practice extending over 1 year. Any resident of the city, upon satisfactory examination, may attend the school free of charge, others paying an annual tuition fee of \$40. The class is limited to 20 in number, beginning with the highest in rank of scholarship and admitted in order after. One month is devoted to the practical work of teaching, for which purpose 2 schools are specially designated and located in the building of the normal school. Graduates have preference in appointment as teachers, other things being equal, and such graduation is considered equivalent to 1 year's practical experience in the estimation of salary. An average of 80 per cent. in the studies of the year is required for graduation, and after 1 year's successful teaching a diploma is given. General teachers' meetings are held every 4 weeks, and the normal pupils are required to attend all regular meetings.

Lancaster.—Soon after the opening of the schools in September, 1886, a class composed of all the teachers in the city schools, together with some who were not teachers, was organized and took up the study of Sully's psychology. This class met every 2 weeks during the fall and winter, and made commendable progress in the study. In addition to psychology, the teachers took lessons in vocal music, and some were members of a Chautauqua reading circle, while others read educational periodicals. Teachers are allowed one-half day during the year for school inspection.

Canton has teachers' meetings every 2 weeks, with a penalty of \$1 for unexcused absence, and 50 cents for each tardiness.

Newark has general teachers' meetings on the Saturday preceding the opening of schools at the beginning of the school year, and as soon after the close of each school month; also general and sectional meetings.

Norwalk has weekly teachers' meetings, and also special meetings at the call of the superintendent.

Salem teachers holding 2 or 3 years' certificates may have the same renewed upon passing satisfactory examinations in psychology and general history as laid out in the Ohio teachers' reading course. General grade meetings are held monthly; also report meetings, and the Teachers' Reading Circle has weekly sessions.

Sandusky teachers have stated meetings and opportunity for school inspection.

Springfield has an annual teachers' institute and teachers' associations. For a few years past normal work has been attempted in connection with the regular work of the schools, and the city superintendent advises a more thorough organization and liberal provision for this department.

Chillicothe, *Ironton*, *Massillon*, and *Xenia* afford their teachers opportunity for visits of school inspection.

Ohio has many teachers' associations. During April, 1887, 7 meetings of teachers were held in different parts of the State for discussion of educational topics, and 3 more were announced for the first half of May.

The forty-first annual meeting of the State Teachers' Association was held July 29-30, 1887, at Akron, where the association was organized in 1847. A special resolution was adopted that there should be appropriate exercises in all the schools of Ohio in connection with the centennial celebration of the first settlement of the State, and it was urged that this subject be presented in all the institutes to be held during the year. The North-western Ohio Teachers' Association met at Lima, December 28-29, 1886; the South-western Association at Cincinnati, January 29, 1887; the North-western Association at Ashtabula, May 14, 1887; the South-eastern Association at Middleport in November, 1886; and the Central Association at Columbus, November 12-13, 1886.

The Ohio Teachers' Reading Circle, founded in 1883, was the first organized State reading circle in the United States. At the meeting of the State Teachers' Association at Akron, in June, 1887, 99 members of the circle were reported as having finished the 4 years' course of reading and were given diplomas. Membership in the circle was reported at 1,120, with a balance in the treasury of about \$130.

OREGON.

Normal schools are established by law at Ashland, Drain, Monmouth, and Weston. Returns, however, have been received from the first two only. The school at Ashland, for the first time in its history, will be conducted under the auspices of the State board of education, during the coming session. The course of study in these schools covers a period of from 2 to 4 years, and consists of elementary, advanced, and professional work, with a collegiate department at Monmouth. Model schools are reported at Ashland and Drain. Free scholarships, apportioned among the different counties, are established at these schools, candidates being required to sign a pledge

to teach and pass such an examination as will entitle them to second-grade certificates. Diplomas of the normal schools are equivalent to State educational diplomas, good for 6 years, and after teaching that length of time, graduates are entitled to life diplomas.

State teachers' institutes are held in the several judicial districts of the State, and are usually largely attended by teachers and people. County institutes were held in 14 counties during the past 2 years, and the increased attendance indicates the growing popularity of these assemblies. Among the good results of institute work noticeable in the State, which applies also to other States, the superintendent of public education mentions that the best teachers are always present at the institute and are active in its support and emphatic in its approval. The best educators from college, university, academy and high school are also in attendance and active in the work; school directors, impressed with the necessity of employing the best teachers, attend the institutes for the very purpose of securing the best qualified and enterprising teachers; and the energetic efforts of county superintendents to improve their schools is also the means of arousing in the minds of school officers and people a renewed and lasting interest in the public schools.¹

The State Teachers' Association held a meeting at Yaquina City, July 6-9, 1886, which was more largely attended than ever before, having 420 teachers enrolled.

PENNSYLVANIA.

The results of normal training in this State are comprehensively summarized by the State superintendent. He says that the commendable service now being rendered in the public schools of that Commonwealth by teachers who have had the advantages of normal school training is the best evidence that can be offered in proof of the fact that these schools are cooperating in the work of education within their proper and legitimate sphere. The marked increase in the number of earnest and faithful students in attendance during the past year shows that the State normal schools as a whole are regarded by thoughtful people with growing favor, and are proving themselves worthy of a most generous support.²

There are 11 State normal schools, besides the Girls' Normal School of Philadelphia, and various training schools and high schools with normal courses throughout the State. The course of study at the State normal schools covers a period of 2 and 3 years, while at the Philadelphia school the fourth, or post-graduate year, is devoted exclusively to practice work in the schools. Tuition is charged at all the State institutions, but the law appropriates to every student over 17 years of age who shall sign a declaration of intention to teach in the common schools of the State the sum of 50 cents per week, and every student who upon graduation shall sign an agreement to teach in the common schools of the State 2 full years receives the sum of \$50. The course of instruction, as recently revised and approved by the State authorities, consists of an elementary course of 2 years and a scientific course of 1 year additional, which arrangement appears to meet with general approval. Academic courses are also established for students desiring to enter college. Admission to the senior class of the professional course is determined by examination in the junior studies, with the exception of pedagogy, the examination being held by the State board of examiners, and being final for those studies. Students passing this examination successfully are given certificates which entitle the holders to admission into the senior class in any State normal school of Pennsylvania at the beginning of any senior year. Diplomas are awarded on the completion of both the elementary and scientific courses. Normal school diplomas are teachers' certificates of highest grade, conferring the right for life to teach, without further examination, in the common schools of the State.

A new State normal school for the thirteenth district, at Clarion, was opened April 12, 1887, with nearly 150 students and a faculty of 10 instructors. The Carrier Seminary, in operation at that place, formed the basis for the school. Two large 3-story dormitories were erected, with all modern appliances for comfort and convenience, and provision has been made for furnishing the library. The chief fact to be noted in connection with the Bloomsburg school is the opening in January of the building for the use of the model school and of the teachers' classes. At the California State Normal School a large extension to the ladies' dormitory was completed and partly occupied before the close of the year. The grounds also have been improved. The school at Edinborough has a model school divided into ten grades, from primary to grammar grades. There is an armory for military drill in stormy weather, while on fair days the young men drill on the campus. The library of 6,500 volumes continues a prominent feature of the school. It is open every day in the year, and a librarian devotes her entire time to its care. Improvements have been made in the heating arrangements at this school. At Indiana important improvements have been made within the year in regard to heating and ventilation. Other improvements of

¹ Report of the State Superintendent.

² State Report, 1887.

value are now in progress and will be completed in time for next year. Much emphasis is placed upon the training department at this institution, and many kindergarten features have been recently introduced in connection therewith. At the opening of the third term at Kutztown, on the first Monday in April, the school took possession of the new building containing a chapel, dining hall, and additional dormitories and recitation rooms. Notwithstanding these increased accommodations, upwards of 40 young men were compelled to room and board outside of the buildings. Among the appliances recently purchased is a solar camera with a large collection of well selected slides. This is used as an aid in teaching geography, and it is intended to be utilized also for the purpose of showing microscopic objects to an entire class during the recitations in botany and physiology. The Central State Normal School at Lock Haven received an extra appropriation from the Legislature of \$15,000, with which the south wing of the building has been finished. That portion of the building which has been in use from the beginning has been also thoroughly renovated. Additions have been made to the teaching force at the Mansfield school. Ten post-graduates were in attendance last year, and all departments of the school are full. More apparatus and furniture have been added to the model school, and the plan of work in this department has been very much improved. Every teacher is required to make careful preparation for every recitation, including both matter and method. A plan of the week's work is submitted to the principal, and he observes whether it be correct and sees that it is put into execution. At Millersville improvements have been completed to the approximate amount of \$16,000. Much interest and enthusiasm is manifested among the students, extra work being done in addition to the required studies. An unusually large number of resident graduates attended the school during the summer session and pursued studies of the scientific course and reviewed others. A reading room has recently been opened at this school. At Shippensburg the libraries have been increased. The building has been thoroughly repaired during the summer and is now in first class condition as to convenience and comfort. The attendance is large and the standard of scholarship has been raised, and the students generally have manifested a spirit of earnest attention to work. At West Chester additions and improvements have been made to new buildings. A new chapel has been erected, with fixed seats for 1,000 persons; the total cost of all improvements made during the year will amount to more than \$40,000. The new course of study has added at least one-half a year to the length of the course and fully a year to its value. High school graduates generally plan to be there 2 years and are well satisfied if they can finish the course in that time. In addition to the careful study of psychology, methods of instruction, school management, and history of education, the graduating classes must now read carefully, and under close supervision, half a dozen of the leading works on pedagogy. These they all buy, and thus make a creditable beginning towards professional libraries of their own. This has proved to be a most valuable feature of the course. Model schools are in operation at all the State normal schools.

The Philadelphia Normal School for Girls has a 3 years' course of professional study and 1 year of practice additional. Only residents of the city and those having been pupils of the twelfth grade in the public schools are admitted. The school is crowded to its utmost capacity, and the principal urges the importance of increasing the age of admission from 14 years. A kindergarten department has been recently established. A notable feature of the curriculum at this school is the teaching of sewing, cutting, and fitting. An examination in this branch of work is held at the close of the 4 years' course of study, and a trial certificate of qualification as teacher of sewing for 1 year is awarded to each member of the fourth year class who obtains an average of 80 per cent. or upwards. At the expiration of a year's teaching on the part of the holder of this trial certificate it becomes void unless evidence of satisfactory teaching is furnished, when the certificate is made permanent. The fourth year students enter the school of practice as teachers immediately after graduation in the normal school, and give instruction at intervals during half the year. Principals', assistants', and trial certificates are awarded to those completing the fourth year, in the order of their scholarship.

Teachers' institutes now stand upon their own merit. Proper remuneration is given to teachers for attendance, and all schools are closed during the time of the institute. They are of inestimable value to the school work, and carry with them wide-spread educational power. Not only are teachers encouraged and benefited by them, but whole communities come under their influence, and the educational authorities can find no surer way to reach the mass of the people than through their instrumentality.¹

Many of the counties have local institutes, educational meetings, teachers' associations, and reading circles. *Allentown* held semimonthly meetings, the primary grades studying Brooks' Normal Methods of Teaching. *Altoona* has a teachers' reading circle. *Beaver Falls* has stated teachers' meetings. *Bethlehem* has semimonthly meetings, and Tate's Philosophy of Education was the subject for special study during the year. There is a teachers' library in this city. *Bristol* has primary teachers' meetings twice

¹State Report.

a month, and meetings once a month for teachers of other grades; in addition to these an institute is held by the teachers. *Chambersburg* had a normal class during the past year composed of the younger teachers, and the improvement made is indicated by a rise in the grade of certificates granted at the last examination. At *Chester* the fifth year at the high school is devoted to a normal class, which reviews all branches named on teachers' provisional certificates. Practice is given in conducting recitations in the high school at the call of the principal, and by observation in the lower grades under direction of the superintendent. Two meetings of the district institute are held each school month, except the month of May. *Easton* has local teachers' institutes. *Eric* has a teachers' training class of one year's study, for high school graduates. Four recitations of 1½ hours have been held weekly, but a convenient room for recitation and practice is needed. Institutes are also held in this city. *Hazleton* has institutes and a reading circle, subdivided into several local clubs. *Lancaster* teachers have general meetings monthly, and primary grade meetings usually semimonthly. There is a teachers' library in this city. *Johnstown* held 5 teachers' meetings during the term, 3 of these being institute meetings. At each, two class drills were given on subjects regarding which assistance had been asked by some teachers. *Meadville* teachers met as an institute every Monday evening during the year, and made a special study of Sully's Psychology. *Nanticoke* high school has a normal course for post-graduates, embracing methods of teaching, mental science, and the history of education. *Norristown* reports the regular district institute as having been continued at stated times, and in addition to the regular school work, a number of teachers organized a class for the study of psychology. This study formed part of the exercises of the institute. *Philadelphia's* city superintendent is authorized to dismiss grammar and consolidated schools two half-days during each term, and all schools of lower grade four half-days each term, for the purpose of holding teachers' meetings; he is also authorized to hold such meetings at other times when the schools are not in session. *Plymouth* township has monthly district institutes, and professional works are recommended for perusal at the beginning of the year. Reading training school was organized a year ago, but the work was interrupted in the middle of the year. The school will be opened again in September, 1887. A teachers' institute is held separate from the annual county institute. *Scranton* has a normal course, taught during the second year at the high school. Monthly institutes are held, and at the close of the winter term an annual institute continuing for 1 week. No teacher will be employed hereafter except high school graduates who have completed the normal course, or graduates of the State normal schools. *Sharon* held monthly meetings, and weekly meetings in some grades, and in others once in 2 weeks. *Shenandoah* has weekly teachers' meetings. *Springboro* high school offers professional instruction during a part of its course for those intending to become teachers. *Tamaqua* held district institutes. *Wilkes Barre* has district institutes, and all the teachers but one are reported to be regular readers of educational journals. The total for the year was 576 monthlies and 834 weeklies. *Williamsport* has a monthly institute, held on Saturdays, with the session the same length as the regular school hours. Visits to other schools for inspection are allowed.

The thirty-third annual meeting of the Pennsylvania State Teachers' Association was held at Clearfield, July 5-7, 1887.

Pennsylvania has a State teachers' reading circle, with elementary and advanced courses of reading.

RHODE ISLAND.

The State Normal School at Providence is gaining year by year a firmer position among the prime factors of education in the State. The past year has been one of most gratifying prosperity, and the school has been full to its utmost capacity. The course of study is academic rather than professional, which is made necessary by the needs of the pupils who enter. These come from localities where there is no high school or other good secondary school, and are hence defective in scholarship. It is recommended to furnish academic instruction of a first-class high school course and then form the normal class of high school graduates and those of equal scholarship. Graduates of the Providence, Newport, and other accredited high schools will be admitted to the last year, and if their work is satisfactory they will be graduated at the end of the year. This course includes the common school branches, with higher and professional studies. The general course occupies three years, with no foreign language in either course. Special attention is paid to the preparation and delivery of original papers on pedagogical themes. Saturday classes are held, to which teachers occupied during the week are admitted. Pupils have practice in teaching and opportunities for observation in the kindergarten and public schools of the city. Tuition is free to all who complete the course of study with the intention of teaching in the public schools of the State. Students are aided by a mileage appropriation of \$1,500, which is distributed among those pupils residing in the State

¹State Report.

at a distance from Providence exceeding 5 miles. Pupils boarding in the city are entitled to the same mileage as if they came from home. The aid furnished to any one pupil can not exceed \$40 annually. Text-books needed for reference are furnished in part by the school.

Cumberland allows two half-days each term for school inspection. *East Providence* held teachers' meetings, and *Exeter* and *Hopkinton* had local institutes. *Newport* school board has declared by vote that in the selection of new teachers they will hereafter give the preference, other things being equal, to normal graduates. This city had various meetings during the past year—a most practical institute, a course of twelve valuable lessons upon reading, the week's session of the American Institute of Instruction in the summer, a course of suggestive lessons upon the principles of teaching by the president of the State Normal School, and recently a fortnightly literary club has been formed numbering 100 members, which includes nearly all the teachers, and exacts from them at least one-half hour of home study daily. *Pawtucket* has a normal teachers' class to which only graduates of high or normal schools are admitted. The plan followed last year was to secure a good primary teacher of experience and place under her charge three young ladies at a small salary each, who should perform most of the work of teaching the two primary rooms of that building, making the training teacher responsible for the character of the work done. A local teachers' institute was held in October. *Tiverton* has monthly meetings of teachers. The Rhode Island Institute of Instruction is the oldest and one of the largest of the State teachers' associations. It partakes more of the character of an institute than of a convention. The forty-second annual meeting was held at Providence, October 28-30, 1886.

A State teachers' reading circle, in which the teachers have shown much interest, has been formed as a recent outgrowth of the Institute of Instruction. The one great object of this organization is to secure the circulation among the teachers of important works on the subject of teaching and of educational training.

SOUTH CAROLINA.

The white teachers of South Carolina are asking for a State normal school for white teachers, and rapid strides are being made in accomplishing the desired end. The founding of the Winthrop Training School for Teachers at Columbia marks a new era in the educational history of the State. The school is named in honor of Hon. Robert C. Winthrop, through whose influence chiefly the Peabody appropriation of \$1,500 was secured which made the establishment of the school possible. The first session opened November 15, 1886, and 14 young ladies graduated at its close. The school occupied the chapel of the Presbyterian Theological Seminary free of charge, but during the year 1887-88 it will be established in a new school building which can be fitted up according to the wants of the school. The annual session is coincident with that of the city schools, the normal course being completed in one year. The studies include the usual common school branches, natural and mental science, science and history of education, with methods and practice of teaching. A model school is connected with the institution. One student from each county, selected by the county board of examiners, is admitted free of tuition; other pupils are charged \$2 monthly. Diplomas are awarded upon completion of the course, equivalent to first-grade State certificates, without further examination.

The Saturday Normal School at Charleston has a course of 4 years' study, with free tuition. South Carolina College at Columbia offers a 2 years' course preparatory for the profession of teaching. Of the 10 Peabody scholarship students allowed this State at the Nashville Normal College, 3 students were graduated at the close of the last session.

Clafin University at Orangeburg, the colored department of the State University, has a normal course of 3 years. For those who can not take the full course there will be organized at the beginning of each spring term a special teachers' class in theory and practice of teaching. The advantages of this course, together with the regular normal course, will be open to teachers free of charge.¹ Five other institutions in the State report normal instruction for colored teachers. About 500 students are in attendance at all these schools.²

The State made no appropriation for normal institutes during the past year. Through the liberality of the Peabody Fund an inter-county institute of 2 weeks was held at Williamston. About 150 teachers from all parts of the State were present. A similar institute was held at Sumter, and others elsewhere, reaching no less than 500 teachers.³

A State institute for colored teachers was held under the same auspices at Columbia. County institutes are held in many counties of the State, and have created an

¹ Catalogue.

² School Journal, November 27, 1886.

³ Report of the Trustees of the Peabody Fund.

enthusiastic interest in the cause of education that must result in a better pecuniary and moral support of the schools.

Columbia reports its teachers laboring to perfect themselves more and more by study and investigation for the work of their profession. The psychological laws and the pedagogical principles which underlie all true teaching have been a special subject of study with them during the year, to the improvement of the schools in instruction and discipline. White's Elements of Pedagogy and Page's Theory and Practice of Teaching have been read and discussed at teachers' meetings in addition to the educational works and journals read privately. Monthly teachers' meetings are held for each race.

State teachers' associations separate for the races are in operation, and hold annual meetings during the sessions of their respective institutes.

Reading circles are reported in some of the counties.

TENNESSEE.

The State Normal College at Nashville, which constitutes the literary department of the University of Nashville, has been in operation as a normal school since 1875. It is designed for the professional education and training of teachers, and "practice in all grades of instruction." Support is received from the funds of the university, the Peabody education fund, and the State. The institution receives as students young gentlemen and ladies from any of the States, and combines with a State normal school for Tennessee a normal college of high grade for the benefit of all the Southern States.¹ The trustees of the Peabody Fund distribute 114 scholarships annually among ten Southern States. These scholarships, of \$200 each, are awarded by the State superintendents to persons not under 17 years of age, after competitive examination in the studies required for admission to the second year class, and the candidates must give evidence of such knowledge of these branches as will justify omitting their further study. Students are again examined at the college with reference to their classification.¹ An accepted candidate must give a pledge to remain at the college 2 years, and promise to teach at least 4 years in the public schools of his or her own State unless formally excused by the superintendent of public instruction. These scholarships will, in no case, be continued to students whose rank or standing is low, or who are otherwise lacking in promise of usefulness in the profession. All students failing to complete their course of study according to the conditions prescribed, or to teach after graduation, are required to refund to the president of the college the amount of money received from the Peabody scholarship. The State of Tennessee receives 14 of these scholarships, and of the students holding these 10 graduated in the class of 1887.

Tuition is free at present, as no person is admitted to the privileges of the college who does not intend to teach. The course of instruction covers 3 and 4 years, and embraces a rapid review of the more elementary studies, with reference to the best ways of teaching them; a review of the more common of the higher branches of knowledge with the same object, and a careful study of such others as time and circumstances will permit, together with the general management of classes and schools, organization, government, discipline, etc. The fourth year, or baccalaureate class, is intended solely for those having completed the regular senior class studies at the college, and includes advanced studies in mathematics, English literature, Latin, psychology, drawing, designing, etc., with German. Students completing satisfactorily the first 2 years of the course receive certificates, and those completing the entire course receive the diploma of the college with the degree "Licentiate of Instruction." This diploma is a State certificate, accepted without further examination by all the States holding scholarships at the college. Students who finish the fourth year may receive in addition the usual baccalaureate degree of the university. As a provision for physical training, a commodious gymnasium has been erected and supplied with Dr. Sargent's apparatus, and placed under the charge of competent and skilled directors, a gentleman and a lady. Attendance at the gymnasium is required of all students, unless excused on the certificate of a physician.

Chattanooga.—The city superintendent of schools is required to form a normal class, with special reference to the practical work of teaching and school government, which all teachers in the public schools must attend regularly. Other persons desiring to prepare themselves for teaching in the city schools may also be received as members of this class.

Clarksville has normal meetings semimonthly for its teachers.

Jackson has regular teachers' meetings with continued courses of study.

Nashville has a successful normal class with regular meetings. Monthly teachers' meetings are held, summer normals conducted, and a teachers' association and a reading circle are also in active operation.

Teachers' institutes for white and colored separate are held by the State superintendent in all parts of the State, and many counties have stated meetings of this character.

¹Catalogue.

The twenty-third session of the State Teachers' Association was held at Jackson, August 23-26, 1887. The importance of summer institutes was brought out at this meeting, and it was recommended that teachers failing to attend such institutes be deprived of their certificates.

Tennessee has a State teachers' reading circle, which is well organized and doing a good work. It has the confidence and support of the State board of education; so much so that it is ordered that "membership in the circle and completion of its course of reading shall be recognized in the future on the teachers' certificates issued by county superintendents."

TEXAS.

Texas has two State normal schools, one for each race, but more normal schools are needed in the State. The superintendent of public instruction recommends the immediate establishment of two more such schools for white teachers, one in west and one in north Texas, and one for colored teachers in east Texas.

The Sam Houston Normal Institute for white pupils is located at Huntsville. Of the influence of this school the State superintendent says: "Sam Houston Normal Institute continues to grow in merit. It has done a wonderful work for Texas, and, if liberally supported, will increase in usefulness each succeeding year. Teachers who have attended this institution may be found in every county and in almost every city. In every instance they are worthy and competent."¹ The eighth annual session, 1886-87, has been a prosperous one; more than 200 students, representing ninety-eight counties of the State, were enrolled.

One State student from each senatorial and each representative district and nine from the State at large receive tuition, books, and board free for one year. Such as show decided ability for teaching, and pledge themselves to make teaching their profession may, upon the recommendation of the principal, be reappointed for a second year. State students are required to stand a competitive examination. Pay students receive tuition and books free, but must pay their own board. All students pass the same examination for admission, take the same obligations, and receive the same certificates and diplomas.²

The course of study is mainly professional, extending over 3 years, each year's work, however, being made complete in itself as far as possible. Satisfactory completion of the first year's work entitles the student to a second-grade certificate, the second year's work to a first-grade certificate, and the third to a diploma.

Through the liberality of the Legislature, during the summer of 1887 the buildings were remodelled and greatly improved, and the apparatus and library increased by one-half, making the normal school the best equipped institution in the State with the exception of the university.

From the beginning the institution has received generous aid from the Peabody Fund, and was, indeed, founded through the agency of Dr. Barnas Sears. This Fund has annually contributed from \$3,000 to \$7,000 to enable the best teachers to be secured and a normal school of a high order to be maintained. In addition, medals have been annually contributed to be awarded to meritorious students, and for all these substantial encouragements the president and school authorities make grateful mention. Nine scholarships are granted the State at the Nashville Normal College, and of the holders of these, 5 graduated in 1887.

The Prairie View State Normal School for colored students is located at Hempstead. The State superintendent reports that it has a most excellent faculty and is doing splendid work. It has accomplished much in elevating the professional character of the colored teachers of the State.³ The course of study extends through 2 years. There were 23 graduates and more than 100 students in attendance last session.

Galveston has normal classes for white and colored teachers. All public school teachers are required to attend, and others may be admitted upon conditions prescribed by the superintendent. Members of these classes, after passing the regular examination, are preferred in appointments, provided they have certificates.

Houston High School has a normal course for pupils of the senior year, giving instruction in the theory and practice of teaching. In addition, normal classes are held for the teachers of the city, attendance being compulsory. Pupils of the normal course in the high school are obliged to attend these meetings when required by the superintendent. Waco has normal classes for each race. Brenham, El Paso, Fort Worth, Houston, Palestine, and Sherman report teachers' meetings and institutes at stated times. Several years ago the teachers of Houston organized a library association which has contributed largely to the efficiency and progress of the schools.

Heretofore a summer normal institute has been conducted each year for the white teachers in each senatorial district, and for colored teachers in each Congressional district except the eleventh, which has not a sufficient number of colored teachers to

¹Report of the State Superintendent, 1885-86.

²Catalogue.

³Report of the State Superintendent, 1885-86.

organize an institute.¹ The Legislature, however, having failed to make an appropriation for the usual summer normal schools, the regents of the State University at Austin tendered the use of the building, apparatus, and library during the month of August, 1887, to be used for that purpose. Excellent work in various lines was accomplished and there was a large attendance of teachers, county judges, and city and county superintendents.

The white State Teachers' Association met at Dallas, June 28-30, 1887, with an attendance of over 500 teachers. The colored State Teachers' Association met at the same place, June 21-23, 1887.

Several years ago the teachers of Houston organized a library association which has contributed largely to the efficiency and progress of the schools.

Texas has a State teachers' reading circle.

UTAH.

The University of Deseret at Salt Lake City has a normal department which has been in successful operation since its creation in 1875. This course was established on its present basis in pursuance of an act of the Legislature of Utah providing for the instruction of 40 normal students annually in the university free of charge for tuition, books, and apparatus. The law provides that such students shall be selected by the Territorial commissioner of district schools from persons nominated by the boards of examination of the several counties. These nominations are usually the result of a competitive examination which is free to all persons in the county. The only condition attached to this provision is that for each year's free tuition so received the students shall serve one year as district school teacher if required by their respective county superintendents.

The course of study is designed principally for those intending to become teachers in the district schools. The instruction given is of a practical character, embracing the every-day work of the teacher at school as well as that of parents in educating their children at home. The completion of the course requires 2 years and the studies and their arrangement are approved by the Territorial commissioner of district schools as required by law. Normal students must take the studies in their prescribed order, and each student on completing the course receives a certificate of graduation. Sixteen graduates in the normal department are reported for 1887.²

Teachers' institutes are maintained in some of the counties but no recent reports of this work have been received.

VERMONT.

Vermont has State normal schools at Castleton, Johnson, and Randolph. No recent data have been received from Castleton. At Johnson and Randolph there are 2 courses, one of 2 years and the other of 1½ years additional, the studies consisting of the usual elementary and professional branches, without any foreign language. Special attention is given to singing in general exercises and by classes, and during 1 term to methods of teaching singing. In view of the fact that professionally trained teachers with ability to teach some language other than English are in constant demand in high schools and academics, it is suggested that the normal schools, in order to provide for this demand, be allowed to add one foreign language to the studies of the second course.³

The higher standard in scholarship of teachers required by the progress made in the educational field has necessitated the raising of the standard for admission to the normal schools. The result has been most satisfactory, and shows a gain in scholarship, which is a better preparation for doing strictly normal work. Every town in the State is entitled to 1 scholarship, and may have others not exceeding 10, "provided the number of scholarships in the 3 normal schools does not exceed the number of towns in the State." Each scholarship is valued at \$12 per term. Graduates who have received the benefit of scholarships must teach 2 years in the State. The diploma for completion of the first course of study is equivalent to a State certificate for 5 years, and that of the second course for 10 years.⁴

Annual teachers' institutes of 3 days are held by the State superintendent in any county where application is made by 15 to 25 teachers of that county. In addition to the county institutes educational meetings of 1 day and evening, or longer, are frequently held.

Rutland has monthly teachers' meetings, and 1 day each term is allowed for inspection of other schools.

The annual meeting of the State Teachers' Association was held at West Randolph, January 27-29, 1887. A State teachers' reading circle has been organized in connection with the "Chautauqua Teachers' Reading Union." Local circles have already been established under this in several towns of the State.

⁴ Catalogue of the Johnson State Normal School.

VIRGINIA.

This State offers normal training for white teachers at Farmville and the University of Virginia, and for colored teachers at Hampton and Petersburg. The State Female Normal School at Farmville is divided into three departments, the normal, or professional department proper; the preparatory school, which is simply a well-taught primary and grammar school; and a model school, which is composed of children under 10 years, who are instructed and trained by an expert model-school teacher. This model school is for the special benefit of the senior class of the normal department, who attend the school in sections, and there observe and teach, and receive practical instruction and criticism from the principal of the school.

The normal department proper covers two years, and the six elementary branches required by law to be taught in every public school, constitute the main lines of study. Besides this standard line of professional work, other studies are pursued with the design of assisting in the teaching of these primary studies. Each line of elementary study is pursued to some extent into its higher continuations, and incidental studies are introduced. The philosophy of the mind, school management, and the theory and practice of teaching each branch, constitute the regular course of separate professional study. One hundred and twenty-eight students are received from the State, who must be recommended by a county or city superintendent, after an approved examination on the six elementary studies. These pay no tuition or other school fees, but must sign a pledge to teach in the public schools of the State at least two years after leaving the normal school. Other students from Virginia may be received on payment of \$25 annual tuition, if their admission does not interfere with the privileges of State students. Public school teachers are also allowed to attend by virtue of their licenses, without tuition fees. A legislative appropriation of \$15,000 served to erect and equip during the past year a commodious building, which furnishes much needed facilities in the way of lecture rooms, dormitories, etc.

White male teachers and superintendents of the free schools of Virginia are admitted to the schools of the academic department of the University of Virginia without payment of fees. The faculty of that institution offers special courses of instruction for such students in Latin, Greek, English, French, German, pure and applied mathematics, natural philosophy, chemistry, botany, geography, and pedagogies, and they are also privileged to attend any of the regular classes in the academic department of the University free of charge. At the conclusion of the courses certificates of attendance will be given by the several professors to those students whose work is approved. University dormitories will be assigned free of rent, in the order of application, as far as the vacant rooms will serve. During the past session about 30 public school teachers of the State availed themselves of this offer and proved diligent, earnest, and successful in their studies.¹

Virginia receives 14 Peabody scholarships at the Nashville Normal College, and of the students filling these, 8 graduated in the class of 1887.

The almost unparalleled career of usefulness and success of the Normal and Agricultural Institute at Hampton, which aims to supply teachers for the colored schools of the middle Southern States and for the Indians, is known and recognized throughout the country. This institution reports 65 teachers and a total enrolment of 709 negro and Indian students for the year ending June, 1887.² Of these over 300 were normal students. In the organization of the school there seems to have been clearly in view the actual condition, the deficiencies, and wants of the negro race. Intellectual development was therefore by no means the only end, if even the leading end, aimed at. The substantial elements of personal character were recognized as the basis of improvement. Honesty, truthfulness, sobriety, industry, economy, and intelligence were to be developed and strengthened as absolutely essential to useful and worthy citizenship. Hence the courses of study—literary, industrial, normal—and the government and discipline have been judiciously directed to these ends. The theory and the practice have been consistent, and the wisdom of both is vindicated by the results. The school is doing a great work. Its graduates are in active demand as teachers for the public schools, and are considered by school superintendents as among the best teachers to be had.³ Six hundred of its graduates and 200 of its under-graduates are said to be teaching about 45,000 colored youth in public schools. Industrial as well as intellectual training is given by most of the teachers reared under these influences.³ This institution is specially a training school for negro teachers and is not able to supply the demands which are made upon it. The teacher of a negro school must be able to earn his living by manual labor during the greater part of the year. This the Hampton graduates can do, because in the school they have had an industrial education. The cost of giving a year's education at Hampton is but \$70; the scholars practically earn their own living in the workshops and on

¹ State Report.

² Report of the State Superintendent to the Trustees of the Peabody Fund.

³ School Journal, New York City, July 16, 1887.

the farm. The farm contains 700 acres, and there are 32 buildings upon the premises, including 13 workshops. Improvements have been made during the past year in the heating arrangements and the gas works. A powerful new steam fire-engine, with a supply of hose, was purchased last summer, and with a drilled fire-brigade is kept ready for emergencies. A partial endowment fund of \$500,000—part of which has been raised—is needed for the further enlargement and support of the school.

The course of study occupies three years, and tuition is free. A training school furnishes the senior class with opportunity for daily observation and practice. The common branches are the main ones throughout the course, and at the close of the term a three weeks' institute is held as a special preparation for teaching. The industrial arts are taught both sexes, the males having instruction in practical farming and in mechanic arts, commenced and continued throughout the entire course, from a day and a half to two days each week. The girls spend an equal period of time in sewing and household industries. Labor is required of all for the sake of discipline and instruction. The school endeavors to give each student over 18 years of age \$5 worth of work monthly, and \$4 in work to each one under 18. This amount, however, is not guaranteed, as the rate of wages varies according to the age of the student and the real value of the work done. In accordance with the law, 100 students are received from the public schools of Virginia free of tuition and room rent.

The Virginia Normal and Collegiate Institute at Petersburg was established by act of the General Assembly, for the higher education of the colored youth of the State, and with special reference to the training of teachers. Twenty thousand dollars annually are appropriated for its support. In addition, the Legislature of 1885-86 appropriated \$32,000 for the completion of the building, and the entire edifice is expected to be ready for occupancy during 1887. Three departments, academic, normal, and preparatory, are in successful operation. The normal course covers 4 years—2 years being preparatory, and 2 years in the regular course. The studies are confined to the English branches exclusively, and are such as are adapted for the profession of teaching. Practice is afforded in the model school attached. The institution is open to pupils of both sexes, and 50 students are furnished with free tuition by the State, provided they promise to teach 2 years in Virginia after graduating. The school does not furnish manual labor to the students, but a farm attached offers opportunity to industrious students to earn sufficient to pay a great part of their expenses.

A summer session of 5 weeks is established by law, intended as a teachers' normal institute, where both the matter to teach and the method of teaching may be obtained. The course of study is not fixed, but varies with the needs and demands of the teachers attending. For the most part the course includes the branches taught in the public schools. Thirty-eight males and 93 females were in attendance during the summer normal of 1887.

During the past summer there were held in the State eight Peabody, two State, and a number of county institutes. The Peabody institutes were so distributed as to make them accessible to a large number of teachers at a comparatively small travelling expense. Some of them were in sections of the State where they had never been held before, and were specially intended to reach a class of teachers who had never enjoyed the benefits of such instruction. The attendance upon the institutes, considering the extreme heat of the season, was exceptionally large, and the work done highly satisfactory.¹ Competitive examinations were held at the various institutes for white teachers to fill vacancies in eight of the Peabody scholarships at Nashville.

The State superintendent says that what is needed in Virginia in regard to institutes is: a State appropriation for their support; a radical change in the plan of institute work, for instead of a few State institutes there ought to be one at least held annually in each senatorial district, and if practicable, one in each county; a 4 years' graded course of instruction, with proper examinations required at the end of each year. Upon these examinations satisfactory certificates should be awarded for the first 3 years, and a diploma for the fourth year, which should relieve from further examination for a period of years, provided the teacher held a first-grade certificate, and had had successful experience in teaching for 3 or 4 years. A course of professional reading should be prescribed for each year, and an examination required therein in connection with the institute work of that year. The superintendent further suggests that teachers be classified at first mainly by grade of certificates and successful experience in teaching; and that an efficient corps of institute instructors be provided whose services could be relied on from year to year.²

The Virginia Teachers' Reading Association, organized little more than 2 years ago, is reported as doing good service. Nearly 500 teachers are taking the course in whole or part, and there has been a considerable increase in the membership during the past year. The reading extends over 2 years, and includes methods and management of schools, anatomy, physiology and hygiene, principles and practice of teaching,

¹ Report to the Trustees of the Peabody Fund.

² State Report.

Painter's History of Education, with White's Elements of Pedagogics.¹ At the Lynchburg institute for colored teachers, the Virginia Teachers' Reading Circle was formed, with a basis of organization similar to that of the white association.

WASHINGTON TERRITORY.

The professional preparation of teachers in this Territory is provided for by teachers' institutes, which are established by law, and attendance made compulsory, with a penalty for absence. An annual Territorial institute is held by the Territorial superintendent of public instruction; and county superintendents are required to hold yearly institutes in counties whenever the number of school children is 500 or more. The county commissioners are empowered to make appropriations for this purpose. The institutes of the past year are reported to have excited more than usual interest among the teachers.

Teachers' certificates, valid for 5 years, and diplomas for life, are issued upon examination by the Territorial board of education. The board of county examiners issues county certificates of 3 grades.

Reading circles are reported at several points in the Territory.

WEST VIRGINIA.

The result of normal school work in this State is a convincing proof of the necessity and importance of such institutions. The president of the board of regents affirms that "no institutions in the State are doing a more noble work for its development, or deserve better of the State than the normal schools."² In order to secure that efficiency and development commensurate with the educational interests of the State, a fixed and settled policy in regard to their financial support is urged by the board. It is also recommended that the academic work outside of the normal course should be made to harmonize with the higher institutions of learning, and for this purpose academic departments have been established in each of the normal schools, in which the work is limited to the preparation required to enter the State University. The graduates of these academic courses are admitted into the University upon certificates of graduation.²

Six schools are established for white pupils, as follows: Concord, Fairmont, Glenville, Marshall College at Huntington, Shepherd College at Shepherdstown, and West Liberty. Storer College at Harper's Ferry is devoted to normal instruction of colored students. Free tuition at these schools is provided for 600 pupils from the different counties of the State. The appointments are made by county superintendents, and subject to the approval of the State superintendent; males and females being selected in equal proportion, as far as practicable. Of such students, 1 year's teaching in the public schools of the State is required after the completion of the normal course. The professional course occupies 3 years, with Latin, French, and German optional. The academic course consists of 2 years' study, which is considered equal to the preparatory course at the State University. Diplomas of the normal department are equivalent to number one certificates anywhere in the State, when the holders have taught 3 years under number one county certificates.

Storer College has an industrial department in which the girls are taught sewing, cutting of plain garments, etc.

West Virginia is allowed 8 Peabody scholarships at the Nashville Normal College. Two students from the State graduated in the class of 1887. The liberal aid from this fund for normal work in the State has largely stimulated interest and enthusiasm in the cause of public schools. This has been reflected in the Legislature by more liberal laws affecting education, and more liberal appropriations to normal schools.

Regarding teachers' institutes, the State superintendent reports the present institute law a success. The teachers in many of the interior counties can not attend the normal schools, and to provide in a measure for some professional training, institutes have been organized in every county of the State, and in some counties where there is a large number of teachers 2 institutes have been held. A Peabody institute is held yearly in the chapel of Storer College during the first week in June, and certificates from the instructor answer the requirements of the law for teachers from any county in the State.

Wheeling.—Teachers' meetings are held at stated periods in this city.

The West Virginia Educational Association held a meeting at Charleston, July 5, 1887.

A State teachers' reading circle has been organized, and is reported to be in successful operation.

WISCONSIN.

The first 20 years of the history of the normal schools in this State show a steady advance towards a clearer conception of the proper province of these schools, a better

¹ Journal of Education, March 10, 1887. ² Report of the Board of Regents of the Normal Schools.

understanding of their possibilities and a more intimate acquaintance with their defects and excellencies.¹

Normal schools are now established at *Milwaukee*, *Oshkosh*, *Platteville*, *River Falls*, and *Whitewater*. The State superintendent reports these schools under the management of able and experienced faculties, equipped with apparatus, laboratories, cabinets, and libraries reasonably sufficient for the requirements of such institutions, and superior to those found in any other schools in the State, outside of the University. The curriculum embraces elementary and advanced study, and is kept abreast of the educational progress of the day. The course extends over a period of from 2 to 4½ years. The school at *Milwaukee*, relying upon thorough preparation at the high schools, has a course of 2 years. The requirements for admission to these schools are being gradually raised as fast as the graded and high schools of the State can furnish pupils with the necessary scholastic training. The attendance is large, and additional teachers are recommended. Each assembly district in the State is entitled to 8 representatives in the normal schools, candidates being nominated by county or city superintendents. An examination is necessary in branches required by law for third-grade certificates, and tuition is free to those signing the pledge to teach. Completion of the elementary course entitles the pupil to a certificate, which, after 1 year's successful teaching in the State, may be countersigned by the State superintendent and is then equivalent to a 5 years' State certificate. To those who complete the full course of 4 years, diplomas are given, which, after a year's experience in teaching and on receiving the signature of the State superintendent, are equal to first-grade State certificates. Light gymnastics are provided for in all the schools, while those at *Milwaukee* and *Whitewater* have workshops for manual training, where students are instructed in the use of wood-working tools. Each of the 5 normal schools has a model school attached, with the various grammar grades of study.

A number of high schools give instruction for the profession of teaching. *Milwaukee* has a normal department with 1 year's course of strictly professional study. There is also a training class in that city for instruction in kindergarten teaching. *Appleton*, *Baraboo*, *Berlin*, *Evansville*, *Green Bay*, *Janesville*, *Madison*, *Sheboygan*, *Sparta*, *Viroqua*, and *Wausau* have incorporated the study of the theory and art of teaching as a part of the high school course. *Appleton* has stated teachers' meetings, at which one study is regularly pursued, and upon which an examination is held at the end of the year. If this examination is satisfactory a certificate to teach is awarded. During the past year the teachers met once a month to recite in history, algebra, and physiology, as well as for the discussion of other topics. Many of the teachers voluntarily organized into a reading circle and did thorough work. A city institute of 2 days was held in the fall, with a large attendance from the neighboring towns and villages. *Baraboo*, *Berlin*, *Green Bay*, *La Crosse*, *Milwaukee*, and *Sheboygan* have monthly teachers' meetings. *Janesville* has meetings every 2 weeks, and at least 1 teachers' institute during the year. The teachers' meetings during the past year were devoted to the consideration of physiology, general history, science, and art of teaching, music, and penmanship. Among the subjects proposed for next year are psychology, school economy, and English literature. *Oshkosh* also has meetings every 2 weeks, while in *Madison* and *Wausau* they are held weekly. In some of these cities the teachers are allowed opportunities of visiting other schools for inspection. *Milwaukee* has a teachers' library which numbered nearly 1,000 volumes in 1886.

The work of teachers' institutes is conducted according to what is known as the Wisconsin system. The usual conferences of institute workers are held semiannually in connection with the meetings of the State Teachers' Association. Fifty-one counties are reported to have held institutes in the summer of 1887, 28 of these of 1 week each, 22 of 2 weeks each, and 1 in Green County of 4 weeks.² A series of institutes for graded school teachers was held during the fall and winter, conducted as far as practicable by a normal school professor, and continuing 2 days, Friday and Saturday.³

The Wisconsin University summer school for teachers during the summer of 1887 enrolled 40 members. The work was elective and discretionary.

The semiannual meeting of the State Teachers' Association was held December 27-29, 1886, at Madison, and the thirty-fourth annual meeting convened at Milwaukee, July 6-7, 1887. The attendance at the latter was about 350.

Wisconsin has a State teachers' reading circle, with a course of study comprising general history, history of education, civil government, psychology, and English literature. In order to increase the efficiency of this work and add interest to the course it is recommended to reduce the studies, have a system of county organization, and hold examinations at stated periods.

WYOMING.

The chief need in educational matters in this Territory seems to be a normal school, but it is doubtful whether such an institution could be maintained with the present number of schools.¹ The University of Wyoming, recently established at Laramie, includes in its curriculum a course of study in the theory and art of teaching, and the law provides free tuition to all students of the University who are nominated by the county commissioners of the several counties.²

Annual teachers' institutes of at least a week's duration are required, and the fare to and from the institute, of all teachers and superintendents of public schools who attend, is paid from the Territorial fund.² A Territorial institute was held at Laramie, August 29, 1887.

PEABODY AID TO NORMAL SCHOOLS.

In regard to appropriations for normal schools and other appliances for the training of teachers, the generous aid of the Peabody Education Fund, with its important results to the cause of Southern education, must not be overlooked. "The graded schools in so many cities and towns and districts; the excellent school laws in so many States; the training schools and normal colleges which have been established in so many quarters of the South; and the normal institutes which have been attended by such throngs of teachers and students, and of people of all classes and ages, and of both sexes, during the summer months, bear abundant testimony to the work which has been done since George Peabody signed that memorable letter of trust."³ While disclaiming all these great results as having been accomplished solely through this assistance, and making due acknowledgment of the coöperation and cordial concurrence of the Southern people in this work, the chairman of the board adds: "It is not too much to say that Mr. Peabody's munificent endowment opened the way, gave the original impulse, and secured a successful progress for that great educational movement in which the Southern States are now rejoicing, and in which it is our privilege and pride to rejoice with them."

The settled policy of the trustees is to use the greater portion of the annual income for normal schools and institutes, believing that nothing is so much needed in the South as trained teachers for the public schools.

The following table will show the several amounts distributed among ten States, for educational purposes, since October 1, 1886⁴—\$57,000 in all, not including \$13,000 to public schools:

State.	Normal scholar- ships.	Value of normal scholarships.	Donated to nor- mal schools in the State.	Donated to teach- ers' institutes.
Alabama	13	\$2,600	\$4,030	\$500
Arkansas	10	2,000	1,500
Georgia	14	2,800	1,500
Louisiana	8	1,600	2,000	1,000
North Carolina	14	2,800	1,000
South Carolina	10	2,000	21,000	1,000
Tennessee	14	2,800	19,500	1,200
Texas	9	1,800	2,500
Virginia	14	2,800	2,500	2,000
West Virginia	8	1,600	1,000	2,000
Total	114	\$22,800	\$22,500	\$11,700

REMARKS UPON THE TABLES.

TRAINED TEACHERS, NEW TEACHERS, CERTIFICATES, ETC.

[Table 23, Page 453.]

Table 23 shows approximately the proportion of professionally trained teachers, new teachers, and number and grades of certificates given to the whole number of teachers employed. The teaching force is given for the present year, from replies of the State superintendents to this Office, while the other data, unless otherwise specified, are compiled from the latest accessible State reports, usually for the year previous. In Cali-

¹ Iowa Normal Monthly, June-July, 1887.

² Report of the Governor of Wyoming.

³ Address of the Chairman to the Board of Trustees of the Peabody Fund.

⁴ Proceedings of the Trustees of the Peabody Fund.

fornia, of the 900 normal school graduates reported as teaching in 1886, more than two-thirds were graduates of the California State normal schools; and of the entire teaching force, 2,012 subscribed for some educational journal. The total number of teachers, winter and summer, in Connecticut were 6,163, as given in the table, of whom less than one-half were continuously employed. The Illinois State Normal University reports over 1,100 graduates and under-graduates teaching in the State during 1886. In Kansas the 335 teachers holding State certificates are all graduates of the State Normal School; and of nearly 12,000 certificates of all grades issued to teachers in Michigan, about one-half had attended institutes during the year. New Hampshire reports 146 towns as employing teachers from normal schools; in Pennsylvania, during the past year, nearly 15,000 teachers read books on teaching; and in West Virginia about one third of the teachers subscribed for some educational journal during 1886.

TEACHERS' INSTITUTES.

[Table 24, Page 454.]

The statistics of this work throughout the country are incomplete, as they are compiled from the reports of the superintendents of public instruction for the several States when such information is given. These State reports are issued annually in some States and biennially in others, and hence complete statistics for the current year are not available. The latest statistics of teachers' institutes are tabulated below. Of the 37 held in Alabama, 15 were Peabody normal institutes for both races separate. Besides the county institutes in Indiana, there were 4,190 township institutes additional; and in Minnesota, 167 local associations and meetings were convened by the county superintendents. District institutes were held in 747 school districts in Pennsylvania during the past year, and the three institutes reported from South Carolina were inter-county institutes, besides which several others were held, with a total attendance of at least 500 teachers. In Vermont many educational meetings were held in addition to the institutes. Wisconsin reports 6,246 teachers in attendance at the seventy-five institutes held in that State during 1886, of whom 1,757 had not taught.

PUBLIC NORMAL SCHOOLS.

[Tables 25 and 26, Pages 456 and 458.]

In the following tables giving the statistics of public normal schools reporting to this Office for the year 1885-87, only those schools are included which receive appropriations from State, county, city, or Peabody funds. These number 124 schools, with 1,235 instructors and 30,296 students. Of the last mentioned, 26,594 are normal pupils, 7,576 of whom are males and 17,507 females, with 1,511 whose sex is not stated. Normal pupils are also reported from high schools (including public and partly public schools), the number aggregating 2,967, while private normal schools and academies increase the number by 18,386 pupils. To these are to be added 1,542 normal students reported from 58 colleges, giving a total of 27,895 in other than public normal schools, and a grand total of 49,489 normal students in public and private schools throughout the country.

About two-thirds of the public normal schools receive State aid; a few are assisted by county funds; while many are supported wholly from the appropriations for city schools. The Peabody Education Fund assists liberally in this cause, distributing nearly \$50,000 annually among normal schools in the South.

PRIVATE NORMAL SCHOOLS.

[Table 26A, Page 464.]

Peculiar difficulties attend the classification of schools reporting under the head of private normals, on account of the following conditions:

Their work is twofold; general and special. The general course is sometimes of an elementary grade, sometimes corresponds to the usual academic course, and is sometimes a union of the two. Again, the special or teachers' training course may consist of a brief series of lectures on methods of instruction or an extended course in the theory and art of teaching, including practice in a model school.

In the former case the special course is not a feature of sufficient prominence to be made the basis of classification. In the latter case the schools are essentially training schools for teachers, and are so regarded in their respective communities.

It is hoped that special inquiries now in progress may secure information that will lead to a more satisfactory exhibit of the number and character of the schools in question than is possible with the present data.

Table 26A presents the statistics of twenty-six private normal schools, having 238 instructors and 8,470 pupils.

TABLE 25.—Summary of statistics of normal schools for 1886-87.

State or Territory.	Number of schools.			Number of instructors.	Number of students in public normal schools.						Normal students in other schools.		Graduates from public normal schools in 1887. a Seven hundred dollars from Slater fund for industrial training.

b Except subcollegiate department, in which normal pupils teach some for practice.

c Since 1879, inclusive.

d The institution itself is a practice school.

e Included in public school estimate.

f These statistics are for the year 1885-86.

g Includes estimated income from endowment and fees.

h From Peabody Fund, \$2,000 for school and \$1,000 for institutes.

i School located in high school building.

replies to inquiries by the United States Bureau of Education.

CHAPTER VII.

KINDERGARTENS.

General progress of kindergarten training--Kindergarten training-schools--Summary of statistics of kindergartens (Table 27)--Summary of statistics of kindergarten training schools (Table 28)--Statistics of kindergartens (Table 29)--Statistics of kindergarten training schools (Table 30).

There are 544 kindergartens reported to this Office for the present year, with 1,256 instructors and 25,925 children, a considerable increase over the year 1885-86.

The majority of kindergartens, whether giving or not giving free tuition, are still supported by private means, only 158 of the whole number being supported by public funds. St. Louis, Milwaukee, and Philadelphia are the only cities in which kindergartens seem to be firmly established as a part of the public school system.

In January, 1887, the kindergartens, which for several years had been under the care of the Subprimary School Society of Philadelphia, were formally transferred to the board of education, and \$15,000 were appropriated for their support. Edward T. Steel, president of the board of education, in accepting the care of these kindergartens in the name of the city of Philadelphia, said: "While I am earnestly in favor of what is known as higher education as a part of the public school system, I believe that it is secondary to the necessity for a perfectly organized system of instruction for the youngest children; and when these kindergartens shall become as extensive as the other grades of our schools—which I believe they will—and manual training (the principle of which is one of the leading features of the kindergarten system) shall be in practice throughout all of our schools, we shall have accomplished the highest position possible to attain in a system of public education, and have fulfilled a duty in regard to youth which the enlightenment and civilization of the times demand."

Boston will soon follow the example of Philadelphia. In December, 1887, the committee on examinations made a report on the establishment of kindergartens in connection with the public schools, proposing to adopt the 14 kindergartens now supported by Mrs. Shaw, and recommending an appropriation of \$20,000 for the year 1888-89 for the support of these and others in different parts of the city.

Other cities are taking steps in this direction, among them Lynn, Mass.; Hartford and New Haven, Conn.; Des Moines, Iowa; and Ionia and Muskegon, Mich.

The kindergarten is found to be invaluable in schools for the blind, and a very interesting fact indicative of progress in this work is the establishment during the present year of a kindergarten in connection with the Perkins Institution for the Blind at Roxbury, Mass. A fine three-story building, built especially for the purpose with money raised by subscription, largely through Laura Bridgman's efforts, was dedicated in April, 1877, with very interesting exercises. Friends of the cause are now soliciting funds for an endowment, in order to place this department of the institution on a firm foundation.

KINDERGARTEN TRAINING SCHOOLS.

For the present year there are 49 training schools reported, with 65 instructors and 524 pupils. Eight of these are connected with public normal schools or supported by public funds, and 5 are supported by free kindergarten associations.

The training school under the auspices of the Subprimary School Society of Philadelphia has been given up to the care of the school board and a modern kindergarten connected with it. In September, 1887, a school of psychology, embracing a chair in "Psychology of childhood and the science and art of teaching and kindergarten," was established, having in connection with it a model kindergarten, primary, and other grades on the Froebel principle and method of education.

CHAPTER VIII.

SECONDARY INSTRUCTION.

Total number of pupils receiving secondary instruction — Explanation of the tables — Scholastic characteristics of secondary schools — Material resources — Summary of statistics of secondary schools supported wholly by public funds (Table 31, Division A) — Summary of statistics of secondary schools supported partly by public funds (Table 31, Division B) — Summary of statistics of private secondary schools for girls (Table 32, Division A) — Summary of statistics for private secondary schools for boys (Table 32, Division B) — Summary of statistics of private secondary schools for both sexes (Table 32, Division C) — Comparative statistics of secondary schools — General considerations arising from the comparative view — Supervisory agents, the Regents of the University of the State of New York — State universities as supervisory agents — Private associations — Commission of colleges on admission examinations — General bearing of the work of the Commission — Duration of secondary courses — Comparative statistics of secondary schools supported wholly by public funds (Table 33, Division A) — Comparative statistics of secondary schools supported partly by public funds (Table 33, Division B) — Comparative statistics of private secondary schools for girls (Table 34, Division A) — Comparative statistics of private secondary schools for boys (Table 34, Division B) — Comparative statistics of private secondary schools for both sexes (Table 34, Division C) — Number and classification of all secondary students (Table 35) — Remarks upon the detailed tables — Statistics of secondary schools supported wholly by public funds (Table 36, Division A) — Statistics of secondary schools supported partly by public funds (Table 36, Division B) — Statistics of private secondary schools for girls (Table 37, Division A) — Statistics of private secondary schools for boys (Table 37, Division B) — Statistics of private secondary schools for both sexes (Table 37, Division C) — Addendum — Admission requirements of universities and colleges (Table 38) — Admission requirements of agricultural and mechanical colleges (Table 39) — Admission requirements of institutions for the superior instruction of women (Table 40).

The total number of schools for secondary instruction reporting to the Office in 1886-87 was 1,476, having 8,604 instructors and 184,616 students. If to these be added the number of students reported in the preparatory departments of superior institutions (Tables 42, 45, 48, and 52), viz, 32,182, there results a sum total of 216,798 pupils reported in courses of secondary instruction.

The independence, variety, and individuality of secondary schools in the United States render it difficult to bring them within the compass of a common scheme of representation, such as might show the quantity and the resources of this part of the educational provision of the country and indicate the direction in which efforts should be expended for the farther improvement and development of the work.

In the present Report the aim has been to arrive at the best classification of the schools and to make an intelligible presentation of those features which pertain to secondary as distinguished from special training.

The source of support, which is the most obvious distinction between the schools, leads naturally to their division into two groups—public and private. Intermediate between the two is a number of schools supported partly by public funds and partly by private funds or tuition fees. They are mostly in the Southern States, and mark a phase in the progress of the free-school system which has nearly disappeared in other sections. Their separate tabulation serves an historical purpose only.

The private secondary schools have been tabulated in three groups, viz: (1) schools for boys exclusively; (2) schools for girls exclusively; and (3) schools for both sexes. This classification suits well with the scholastic characteristics of the three groups.

In the United States, as elsewhere, secondary instruction tends largely to two courses—the “classical” and the “scientific.” These convenient terms can not, however, be employed in our tabulation, from the want of uniformity in their use. The former has three applications: first, as including both Latin and Greek; second, as allowing alternatives between Greek and French and German; third, but rarely, as including the classical literature of any language.

The importance of the two courses as compared with the entire work of the schools may be inferred from the following summary :

Proportion of students in classical and scientific courses.	Schools so reporting.	
	Grade.	Per cent.
25 to 50 per cent.....	High schools.....	a28
	Private schools.....	16
50 to 100 per cent.....	High schools.....	a36
	Private schools.....	27

a Includes public and partly public.

The schools for boys exceed all other classes of secondary schools in the proportion of their pupils classified as above.

In addition to the classical and the scientific course, there is a third course numerically large, variously constituted and variously named, as "general," "English," and "literary."

Normal and business courses are incidental to the main work of secondary schools, being very generally pursued in connection with other courses.

The work in progress in the schools can not, however, be so well indicated by courses as by particular studies, choice being made of those having known value. Mathematics naturally stands first in the list. Of this branch it is sufficient to say that algebra and geometry are invariably included in the secondary programmes, and are pursued either together or in succession throughout the course. Physics and chemistry are common features, and are generally taken in the order named. From an inquiry respecting the latter it is found to be a requisite for graduation in 295 high schools, or 57 per cent. of the whole number (26 schools specifying scientific or general course), in 61 per cent. of the private schools for girls, in 26 per cent. of the schools for boys, and in 50 per cent. of the schools for both sexes.

The statistics pertaining to language studies which, all things considered, afford the best index of the work, have been tabulated, and are summarized in Tables 31 and 32.

The inquiries were intended to secure information as to the number of students pursuing a foreign language and the number confining themselves to English.

Unfortunately one question, viz, "What is the number of students pursuing English branches exclusively," was susceptible of different interpretations. In several cases it was understood to exclude pupils in drawing; in others the entire enrolment of the school was given in reply, notwithstanding the fact that this was contradicted by the answers to other inquiries.

In the case of all the schools, save those for girls, it was found possible to correct the mistakes arising from this misunderstanding in time to use the information, either in the integral or in the ratio tables. For the girls' schools the statistics remain incomplete.

The tables show further the number of secondary pupils pursuing drawing (free hand and mechanical), a matter of daily-increasing interest, both on account of the recognized importance of the exercise as a part of general training, and as a preparation for scientific and technical training. Statistics of other forms of manual training have also been included. The summary of students preparing for superior institutions completes the view of the scholastic work.

As regards financial particulars, our present information is exceedingly defective, neither income nor expenditure being included. Property valuation, permanent funds, and benefactions are shown in the summaries of the schools for boys and the schools for both sexes. In the summary of the schools for girls, and the high schools, public and partly public, permanent funds have not been tabulated. Six private schools for girls report under this head a total of \$119,000, and 27 high schools a total of \$683,305.

COMPARATIVE STATISTICS OF SECONDARY SCHOOLS.

Tables 33 and 34 bring into comparative view the particulars summarized in the foregoing tables.

Confining our attention to public schools, it appears that a little more than one-third of the pupils pursue English branches exclusively; in the partly public the proportion is still larger.

Latin holds a prominent place in the curriculum, and is evidently not merely the sign of a course preparatory to college or to scientific school, since the proportion of pupils pursuing it is much greater than the proportion intending to matriculate, as will be seen by the comparison of Columns 3 and 8. It is interesting to note that notwithstanding the enthusiasm for science and the commercial value of scientific knowledge, the classical preparatory course attracts a larger proportion of scholars than the scientific, even in the public high schools, which are often charged with fostering too largely the money-making propensity.

Table 34, Divisions B and C, derived from the statistics of private schools for boys and for both sexes, include one column more than Table 33, showing the number of pupils not distributed under the specified languages.

The larger proportion of the schools not answering the questions relating to particular studies give some data from which the facts may be inferred.

As regards the schools for both sexes, viz, Table 34, Division C, the inference is that the majority of the undistributed pupils are in English branches only, while in the case of the schools for boys (Table 34, Division B), the reverse is to be inferred.

In the schools for boys, as in the public high schools, Latin is a leading feature, and in all classes of secondary schools it holds the first place among foreign languages. The schools for boys are the only secondary schools, as a class, in which Greek has prominence; it is noticeable, further, that they show the highest percentages in all the languages, except French, in which the schools for girls take precedence.

About one-third of the work of the boys' schools is professedly preparatory to college or to scientific school, the proportion in the classical preparatory being a little more than double that in the scientific.

The relation of the several particulars embodied in Tables 33 and 34, as it appears for the entire country, is shown in Table 35.

Several considerations applicable to all classes of secondary schools are suggested by the statistics before us:

First in order is the importance of a well ordered English course, in which the studies, their sequence, and the time allotted to each, shall be carefully and intelligently determined.

Second, the importance of determining the proper relation of Latin to secondary training in general.

Third, the importance of so adjusting the preparatory courses and those of superior schools as to prevent waste of time and effort by the overlapping of studies.

Although individual schools can be instanced in which these essentials are well ordered, considering the country at large there is serious want of authoritative agencies to systematize the work along the lines indicated. A few such agencies have been organized in particular States.

First among these should be noted the supervisory work of the regents of the University of the State of New York. In order to have the benefit of the regents' inspection and examination and to share in consequence in the distribution of the literature fund, academies and union schools must comply with the following conditions: "The possession of property amounting to at least \$5,000 over and above all incumbrances, and that the debts shall not exceed the one-third part of said property; and that, besides the buildings (which, as required by law, must be of the value of at least \$2,000), said property shall include a library of suitable books worth at least \$500, and apparatus and collections suitable for instruction in physics, chemistry, and natural history, worth at least \$500; and that reasonable assurances exist of a sufficient income for the suitable support of said academy and of the attendance thereof of at least 25 scholars who are qualified to pursue the proper studies of an academy."

The following survey of the academic examinations is from the annual report of the regents of the university for the year 1885-86:

"In 1866 the system of academic examinations was organized by the board, for the purpose of determining in a more satisfactory manner the number of qualified scholars entitled each year to share in the distribution of the literature fund. The first year in which this test was applied, the number allowed as entitled to share in the distribution, was reduced from 20,443 in 1865 to 13,140 in 1866, in 1867 it fell to 10,806; a reduction in 2 years of nearly one-half. The minimum of 5,873 was reached in 1872, since which time the increasing number of schools and students, more thorough and efficient instruction, and the influence of examinations in advanced subjects organized in 1878, have caused the number to steadily increase to 12,583 in 1886.

"While these examinations were instituted as a more intelligent means than that before employed for determining a proper basis for the distribution of the literature fund and have more than fulfilled the expectations of their projectors in this particular, they have performed and are performing other and far more important functions, in testing, by instrumentalities outside the regularly employed means of instruction, the efficiency of that instruction; while at the same time the knowledge of the pupil is shown, a uniform standard of scholarship is established throughout the secondary schools of the State, and that standard is maintained at a much higher point than has before been reached in these schools.

"The experience of two decades shows the wisdom with which the foundations of the system were laid. The patient and harmonious efforts of principals and instructors, of boards of trustees and boards of education, combined with those of the board of regents, have developed and strengthened the system until it has reached proportions and is performing functions not anticipated at the outset.

"The system, entirely unique, has the almost unanimous support of those engaged in the work of secondary education in the State, and the fact that each year numerous inquiries are received in regard to the system and numerous applications made by secondary schools to be received under the visitation of the board, chiefly in order to share in the benefits derived from the system of examinations, bears witness that the system is fruitful in good results for the educational interests of the State."

In 1885-86 the number of academies visited was 276, having 1,400 teachers and 37,735 scholars, of whom 12,583 were academic. The number of subjects covered by the examination questions was 41.

While the regents' examinations have a stimulating effect in every part of secondary work, nearly all the other agencies for its improvement are directed to the course preparatory to college or to scientific school.¹ Among these should be noted the system established in a number of Western States, whereby graduates of approved high schools are admitted to the universities without further examination. This becomes virtually a system of supervision.

The following private associations devoted to the work in question have become well known through their published proceedings: The Associated Academic Principals of the State of New York; the Massachusetts Association of Classical and High School Teachers, and the New England Association of Colleges and Preparatory Schools. An outcome of the last mentioned is the Commission of Colleges in New England on Admission Examinations. The purpose of the Commission is sufficiently indicated by its name; its work is that of investigation, discussion, and advice. The wide-spread interest which its deliberations have excited shows that the problems with which it has to deal affect the entire country, so that the solutions which prove sufficient for the exigencies of one section will be of practical advantage to the others.

The Commission was definitely established in September, 1886, and comprised the following colleges: Amherst, Boston University, Brown, Colby, Dartmouth, Harvard, Smith, Trinity, Tufts, Wellesley, Wesleyan, Williams, and Yale. The following statement is from the first annual report, covering the operations of the Commission for 1886-87:

"At a preliminary meeting held April, 1886, the Commission considered the division of admission examinations into preliminary and final examinations, and made the following recommendations to the colleges:

"1. *Voted*, To recommend to the several faculties to permit candidates in the preliminary examination to be examined only in those subjects in which their teachers certify that they are prepared, and in which they present themselves with their teachers' approval.

"2. *Voted*, That this Commission suggest that the several faculties recommend the reservation of the following subjects until the final examinations: Vergil, Latin prose composition, Homer, Greek prose composition, geometry, French, and English composition."

"On the 7th of January, 1887, at a special meeting of the New England Association of College Officers and Preparatory Teachers, the secretary of the Commission, by invitation, read an account of the formation of the Commission, and a statement of its proposed work. He invited the preparatory teachers to present to the Commission any questions which seemed to them important and germane to the work. Responding to this invitation, the Association appointed a committee to communicate with the Commission. This committee, consisting of Messrs. F. A. Hill, principal of the English High School, Cambridge; W. Gallagher, principal of Williston Seminary, Easthampton; and C. F. P. Bancroft, principal of Phillips Academy, Andover, sent a communication, which was presented to the Commission at its annual meeting in April, 1887."

¹ See, in this connection, scheme of admission requirements, Tables 33, 39, and 40.

With respect to the appropriate functions of the Commission the communication set forth that the preparatory schools accepted the views formulated by the Association of the Colleges.¹ As regards other matters of common interest the communication was as follows:

"1. The preparatory schools undoubtedly approve the first vote of the Commission at its meeting in 1886, recommending to the several faculties to permit candidates in the preliminary examinations to be examined only in those subjects in which their teachers certify that they are prepared, in which they present themselves with their teachers' approval.

"2. The second vote of the Commission, recommending the reservation of Vergil, Latin prose composition, Homer, Greek prose composition, geometry, French, and English composition, meets, in its general purpose to set apart certain subjects as suitable for the final examinations, with entire approval.

"3. The committee find that the reservation of French for the final examinations does not commend itself to the preparatory schools. This fact was apparent at the special meeting of the New England Association of Colleges and Preparatory Schools, held in Boston in January last. Wherever the committee have been able to ascertain opinion about the proposed reservation, they have found dissent.

"The objections raised are not against the theory that it is wise to prevent interruption in the study of subjects which would be continued after admission to college, but rather to the practicability of applying this principle fully, on the basis of a fair division of subjects between the preliminary and the final examinations.

"The committee respectfully ask the Commission to consider the propriety of leaving French optional, at least for the present.

"4. The committee beg leave to suggest that in the English requisitions, the limit, not only in the number and variety of authors and works recommended, but also in the annual changes, has been reached, if not passed. They regret the lack of uniformity that still exists in these requisitions, notwithstanding the fact that many colleges are in accord.

"This committee also presented a communication requesting 'that the examination in Greek and in Roman history be divided. The fact that some colleges separate the two subjects while others do not, is, at times, a source of embarrassment.'

"Further, the statement was made, qualifying the suggestion as to the requirement in English, 'that there would be no serious objections to the quantity of reading at present required, if the pupils were not required to carry it all for examination purposes.'"

The report further states that:

"By invitation, Mr. F. A. Hill, chairman of the committee sending the communication, appeared before the Commission and presented more fully the views of his committee.

"As it appeared that the recommendation of the Commission to reserve French for the final examination had been adopted to some extent, it was thought best not to discuss that question at present.

"The requirement in English was discussed at length, as it was clearly the question of most urgent importance in the conviction of the preparatory teachers. It was finally voted 'that further consideration of the subject be postponed until the next meeting of the Commission.'

"This subject, therefore, is now before the colleges for their consideration. It is hoped that discussion by the several faculties may enable the Commission to take more definite action when it next shall meet."

At this point the deliberations of the Commission have an important general bearing, since, as regards the mother tongue, all secondary courses may well be made uniform.

The value to be attached to the study of English language and literature is not a matter of recent recognition, but the extension of courses in this direction, the improvement in methods of instruction, and the appointment of special teachers for the work are noticeable features of recent progress in the leading secondary schools both public and private.

Several investigations in respect to this development are now going on in the Office with the view to a full report upon the same. Intimately connected with this subject is that of provision for other modern languages. Here the secondary schools are benefitted by the labors of the Modern Language Association, which embraces in its inquiries and deliberations both preparatory and collegiate courses.

¹ The views referred to were recorded in the following votes:

"First. To maintain with punctuality the existing degree of uniformity in the requirements for admission.

"Second. To bring about a greater degree of uniformity in requirements upon common subjects.

"Third. To bring about a greater degree of uniformity of regulations in regard to the division of admission examinations into preliminary and final examinations.

"Fourth. To urge the use of identical examination papers upon common requirements."

The most important consideration relative to secondary instruction is that of the time devoted to the work. This underlies all questions of curricula and of the adjustment of preparatory to superior courses, and has, moreover, social and economic bearings which can not be ignored. It is a matter about which there is great diversity of practice, and also one with reference to which it is difficult to secure satisfactory information.

Two inquiries made by the Office this year were directed to this subject. The first asked the age of admission, the second the duration of the course of study under three heads, viz :

- (1) Preparatory to classical course in college.
- (2) Preparatory to scientific course in college or scientific school.
- (3) General academic course.

It was found that as a general rule in the high schools answering the inquiries, the three courses have the same duration, which is either 3 or 4 years. In a few cases the scientific preparatory is one year less than the classical.

In the private schools for boys, on the contrary, the scientific preparatory is, as a rule, a year shorter than the classical.

The following summary shows the possibilities or probabilities as to the age at which pupils will finish secondary courses considering their duration and the age required for admission. Where the three courses differed in time the classical preparatory was the one employed. The number of high schools responding to both inquiries was 97, and the number of private schools for boys (the only class here considered), 91:

Age at completion of course.	Percentage of number of schools answering.		Age at completion of course.	Percentage of number of schools answering.	
	Public.	Private.		Public.	Private.
12 years	None.	6	17 years	31	15

		Latin.	Greek.	French.	German.	English only.					Latin.	Greek.	French.	German.	English only.	In classical course.	In scientific course.
United States .	181, 116	44, 528	8, 179	17, 121	19, 938	33, 436	12, 904	6, 160	19, 074	25	5	9	11	18	11	63	33

The detailed tables, viz, 36 and 37, show for the individual schools responding to the inquiries of the Office the particulars involved in the summaries.

From an examination of Table 36, Part 1, it will be seen that of the seven largest cities of the United States three, namely, New York, Brooklyn, and Philadelphia, have no place in the table before us, while one, Baltimore, is represented by high schools for girls only. This omission arises not from the lack of public provision for secondary instruction, but from conditions of the work peculiar to the respective cities.

Brooklyn, N. Y., has maintained since 1878 a central school to which pupils are advanced from the grammar grade. In his report for 1886, Hon. Calvin Patterson, superintendent of public instruction in that city, gives the following statistics of the school for the year mentioned :

Sex.	Number admitted.	Number graduated.	
		Commercial course.	Regular course.
Boys	279	90	33
Girls	525	188
Total	804	221

"The courses of study were enlarged in July last by the adoption of a 3 years' language course, and a 2 years' commercial course in place of the 1 year course. The English course remains 2 years as heretofore."

Respecting the general scope of the school the superintendent says: "The courses of study now prescribed for the pupils of the Central School do not materially modify the general scope of the work. Pupils completing the language course would not be admitted to the classical course in any college. The committee of the school and the board of education have refused as yet to include among the subjects taught any branches that were not necessary to the proper preparation of the young ladies for teaching and the young men for the every-day affairs of life. It is to be hoped that the time is not far distant when the young people of Brooklyn will be favored with the same educational advantages that are granted to the youth of other cities."

New York City maintains a normal college for girls, the statistics of which will be found in Chapter VI of this Report, page 460, and the College of the City of New York, which is tabulated in Chapter IX.

The first 2 years in the Normal College are entirely academic, the second 2 partly academic and partly professional. The curriculum includes Latin, French, German, mathematics, extended courses in science and in literature, with music, drawing, and intellectual philosophy considered especially in relation to the art of teaching. Candidates for admission must pass an examination.

Philadelphia maintains a central high school for boys and a normal school for girls, which latter is tabulated in Chapter VI.

The 4 years' course of the Central High School includes Latin, German, and a fine course in drawing. Graduates from this course receive the degree of B. A. The course in the Girls' Normal School is of 3 years' duration with a post-graduate year for those intending to teach. In his report for 1886, Mr. G. W. Fetter, the principal, states that "the chief object of the school is to give the pupils a thorough English education before graduation, and to supplement this by furnishing the post-graduates such additional training as instructors of youth need and must have to insure success."

In addition to the 2 high schools for girls included in the table before us, Baltimore maintains a college for boys which is included in Table 45.

In the city of Boston there are 10 high schools, which were characterized as follows by Mr. Philbrick, "six local mixed schools of the lower order and 4 central schools of the superior order, a classical, and a non-classical, one for each sex."

For convenience of reference the principal statistics of the dissimilar institutions of academic grade comprised in the public school systems of the 7 largest cities are exhibited together in the following table, only the 4 central high schools of Boston being included :

City.	Number of schools or colleges.	Number of instructors.	Total number of students for the year.	Amount paid for teachers' salaries.	Total expenditure.
New York, N. Y.	2	79	3,180	\$174,893.91	\$214,621.97
Philadelphia, Pa.	2	42	1,816	57,694.89	69,885.03
Brooklyn, N. Y.	1	33	1,698
