As we reread our article, we were reminded of a time when our teaching was on the edge; it was dynamic challenging and collaborative. It also reminded us of how quickly the technology dates itself and how we must be at the forefront. We understand that there is an urgent need for teachers to prepare students for a world that is totally unknown, for jobs that don't currently exist, for rapid and constant change. Our students need to stand out, not fit in. In order for this to occur, we need to keep designing learning experiences like the educational mysteries that allow them to become creative problem-solvers and risk-takers.

During and after each iteration of the educational mysteries that we designed, we sat together and reflected on our direction, made small adjustments to what lay ahead and aired our frustrations especially when the technology let us down. The project was always a work in progress and we were aware that at times, the technology we had built was limiting our students' ability to take the mysteries in a range of directions. The journey we shared with our students led us to go well beyond tinkering around the edges of change to help them build and practise future skills in order to become innovators.

Since writing this paper, we reflected upon and brainstormed a radically revised approach. It was one where students had far greater control over the direction of the mystery along with more open-ended problems. We devised rich tasks where there were no pre-conceived end points to their investigation. But the investigation retained important features of our original approach. It retained our desire for the students to engage with the technology in purposeful ways, to engage with integrated ideas, deep learning, with problem solving, with curiosity and critical thinking, with creativity and with each other. We also retained some of the whimsy the collaborative elements of the investigation, supported by a range of technologies. However, unlike the custom-made technology platform we used in the *Education Mysteries*, we use readily available apps that are commonly used in schools.

*Gloria:* In retrospect, it was a highly labour- and time- intensive project that sapped a lot of our energy. We were sustained by our unwavering desire to immerse students in a first-hand experience of integrated curriculum and 21<sup>st</sup> century teaching and learning that incorporated technology in meaningful ways.

As a teacher educator, it was also quite wonderful for me to work alongside a colleague committed to the same ideals and to be negotiating our way even when we were uncomfortable and uncertain at times about what was around the next corner.

I learned a great deal about the importance of risk-taking and acceptance of not knowing and of drawing upon the skills and knowledge and wisdom of my co-teacher and our students. I had taught the importance of these qualities yet it was important to experience them.

While many of our students had content knowledge, knowledge of how to use and engage in social media and could teach how the technology worked, they were not always critical consumers. In addition we found they were not always able to transfer their knowledge and skills to new situations. They needed further practice. Fortunately, but also unfortunately, this course stood out from the rest of their program. It was fortunate because the pre-service teachers had the opportunity to experience connected learning. Yet unfortunately it confused many of them as it was not part of an overall philosophy about the kind of learning 21<sup>st</sup> century students require. We recognised that a shared vision is essential in order to manage and sustain needed change.

*Nicky:* Reflecting upon our experience with this course, I recognise that there are enormous benefits to be had from challenging our students, from making them a little (or perhaps a lot) uncomfortable. With discomfort comes an opportunity to examine previously unexamined beliefs and practices. Many of my students in the course that has evolved out of the Education Mysteries are initially confronted by the design of the learning experience, and are somewhat resistant to the expectation that they are problem-solvers rather than information recipients. However, by mid-course, they understand its purpose and see, some for the first time, what it really means to “do” student-centred learning. One of my greatest delights is seeing some students, often the less academically capable students, come to life as we engage in role play, in investigating, questioning and in the ubiquitous technology I integrate along their learning journey. The pedagogy we employ and the technology tools we use provide the students with alternative modes of representing their learning. This is such a powerful lesson for them to learn.

We are pleased that so many teachers have found our article of interest. Its popularity may be due in part to teachers’ searching for new ways to lift themselves out from under standardised teaching and learning and meet the emerging and future needs of their students.

### **Abstract**

*This paper shares the findings from a three year Participatory Action Research Study around the selection, implementation and effectiveness of educational technologies for enhancing learning in a Teacher Education subject for second year pre-service primary teachers. The innovative Project-Based subject is described using a critical lens. The paper will share how two lecturers and their students explored their changing roles as teachers and learners and the tensions that emerged between their beliefs about student centered, authentic learning and the role of technology. It will explore the ways the technological innovations began to reshape and inform thinking about teaching and learning practices.*

### **Keywords**

*Teacher education, transformative pedagogies, ICT, disruption*

## **Introduction**

Universities appear to have lost their way. Non-attendance at lectures is an ongoing problem occurring across countries, universities and disciplines (Gosper et al., 2008; Gump, 2004; Nicholl & Timmins, 2005). To address the concern of low attendance and lack of motivation, the Association of Universities and Colleges of Canada held a two-day summit in March 2011 in Halifax, Nova Scotia on transforming undergraduate education in Canada. Many delegates spoke of the need to foster innovation in teaching and subject design, for example, “*part of what is happening is that students are afraid to take risks, they are absolutely driven by the tyranny of marks*” (Ramona Lumpkin, President of Mount Saint Vincent University).

Salopek (2003) argued that Generation Y or “digital natives” as Prensky (2001) called them, prefer a different approach to learning. As visual learners, they are attracted to graphics, animation

and video; they are active learners as opposed to passive; they can have a relatively short attention span and the boundaries between work and play are increasingly blurred. As well, Generation Y expect technology to be a big part of their learning experience. Presently many university programs have not succeeded in integrating innovative approaches to learning with the use of technology into their teaching and into students' learning (Brown & Warschauer, 2006; Fishman & Davis, 2006; Otero et al. 2005). Teacher education students, whilst skilled at using technology in their personal lives, need to have a better understanding of how technology can support student learning (Angeli & Valanides, 2009). Numerous studies provide evidence that students in programs that integrate and model the use of technology perform better (Drake & Burns, 2004; Nolan & McKinnon, 2003; Otero et al., 2005). Teacher education institutions are being urged to model the integration of technology and student-centered pedagogies to their students (Ertmer & Ottenbreit-Leftwich, 2010).

This paper describes the experiences of two teacher educators who attempted to foster innovation and risk taking in a technology-enriched subject to engage Generation Y learners. It explores their changing roles as teachers and the tensions that emerged between their intended and enacted practices about student-centered, authentic learning and the role of technology.

## The Innovation

The subject emerged in response to a perceived need from both anecdotal and Course Experience Survey data to address issues of student disengagement in the second year of a four year Bachelor of Education primary program. The following four aims are central to the subject and the research project:

- to engage students in their learning;
- to disrupt the norms of traditional schooling and demonstrate risk taking, rather than further traditional transmissive models of teaching;
- to integrate technology in ways that were purposeful, student-centered and authentic, and in ways that fostered exploration and discovery (Jonassen, Howard, Marra & Crismond, 2008); and
- to enable students to transform ideas and skills to their own teaching practices.

Interested staff from a range of disciplines (literacy, maths, science and ICT) met together to plan for this innovation. What emerged was a blended learning environment - an extended face-to-face role-play over an entire semester supported by an online environment where a mystery needed to be solved.

Utilising and building on what we knew about drama, cooperative learning, digital gaming and project based learning, we fashioned three different mysteries over the three year project<sup>1</sup>. The 150 students and staff who participated in the **subject** each year wore two hats – one as a learner, immersed in the mystery, the other as practitioner, reflecting on the pedagogical approaches modelled throughout the mystery. Each student and staff member was allocated a character's role to adopt as members of a Task Force. Each student character had one of five occupations related to the content of the mystery. Teams were made up of at least one member of each occupation in an attempt to foster students' abilities to see situations from multiple perspectives. Each team was part of a central Task Force working collaboratively to solve the mystery. Our intent was to foster

---

<sup>1</sup> The first mystery centered on the discovery of an abandoned alien spacecraft and the subsequent search for the missing alien; the second mystery was to solve an environmental disaster related to a city's water supply; and the final mystery was a criminal investigation into the theft of a valuable piece of art. All three mysteries integrated literacy, mathematics, science, geography and information and communications technology. All three mysteries were possible but implausible.

collaboration rather than competition amongst the teams of students, so varied pieces of “evidence” were provided to some team members but not others. The evidence, delivered to the students online and face-to-face, came in a variety of media that needed to be read/viewed/solved in myriad ways. Teams had to study, synthesise and report their findings to the other members of the Task Force in order to collectively build evidence and hypothesise about the potential solution. Our intention was to leave unanswered questions to allow students the opportunity to construct alternative pathways within the mystery. The project design incorporated online lectures, discussion forums, wikis and web pages integrated into the university's Blackboard learning management system.

Our students often struggle with the demands of group work because of personality clashes and differing work ethics, geographic dispersion, timetables and differing work/study arrangements. To assist with some of these challenges, each team was provided with its own private wiki space where they were asked to share the knowledge they were building, to post and modify their findings, hypothesise after each phase in the investigation, and to use the space to organise and allocate responsibilities within their team. The intent was to use technology authentically, to provide a space where students could collaboratively build knowledge in ways that did not rely merely on face-to-face interactions.

In the process of developing this simple environment, we were active in learning more about the technology. Reflecting on the nature of the first mystery gave rise to thoughts about what else might be possible if we could overcome the limitations of our own technical skills. The University's Education Media Group offered us expertise in multimedia production, graphic design, web development, video production, and photography. They would transform some of the dreams in our heads to innovative realities. The result in the second mystery was a far more sophisticated online environment, complete with Flash interactive learning objects, images, podcasts, videos, a custom made wiki, blogs and a discussion forum that allowed people from outside the university to participate, all delivered in a slickly-designed web based 'desktop' interface. A key feature of the new online environment was a content management system that allowed us to deliver different 'evidence' and clues (content) to different individuals and groups of individuals.

## **Methodology**

While developing the blended learning approach, there was need for collaborative, systematic and comprehensive feedback as part of a three year Participatory Action Research (PAR) project. This involved us planning, acting, reflecting, evaluating, and initiating additions and improvements which have assisted in expanding and strengthening the blended inquiry-based mystery over time (Burns, 1999; Kemmis & McTaggart, 1988). As a process-oriented and collective approach, PAR helped us to contextualise our research knowledge by monitoring our teaching and students' learning over time, as well as assisting us to make informed decisions about change. We understood the value of PAR as appropriate for carrying out classroom-based research. This methodology also assisted the development of skills of observation and critical reflection in and upon our practice with a view towards improving our teaching and learning. The approach used can usefully be applied to many aspects of classroom practice such as curriculum development, teaching and learning methods, strategies and assessment (Hopkins, 1993; Kemmis & McTaggart, 1988; Zuber-Skerritt, 1993). The research was intended to enable all participants to collect, analyse data and eventually transform their practice. The students' investment was to discover more effective ways of using technology to better their teaching.

The Participatory Action Research undertaken took the form of opening up a pedagogical space for ongoing dialogue and critical reflection. By engaging in role-plays, lecturers and pre-service teachers become members of two different worlds simultaneously: the learner and the teacher. Boal (1995) described this state of being as “metaxis.” In this state, the participant can better understand

“real life” through the nexus between the imagined and the real. This opens up a dialogical space of possibilities for change to occur from routine, unexamined practices.

### ***Data collection and analysis***

Data was collected in weekly planning meetings over the three years of the project and extensive debriefings amongst teaching staff during and at the end of each mystery. Using professional journals teaching staff recorded weekly reflections that related back to the project’s aims, capturing students’ reactions and responses to the pedagogies we adopted and the technological environment in which they were immersed. We recorded our joys and frustrations with the technology and our perceptions about the strengths and inadequacies of our pedagogical approaches.

Data was also collected from student feedback in classes and in their normal subject evaluation surveys. Each year a series of online discussion forums were established seeking student reflections on their initial reactions to the subject, the disruptive pedagogies being used, the role that ICT played in the subject, the use of role play, cooperative learning, and higher order thinking.

Student reflections prepared as part of assessments were also collected. A series of focus groups were held with students participating in the subject at the end of the academic year. Students and teaching staff had open conversations about the positive and negative aspects of the subject, its usefulness to them as teachers and the role that technology played in the subject. Focus groups also explored new ideas to refine future mysteries and their implementation.

In keeping with the principles of PAR, data was analysed each year in terms of the initial project aims. Common themes based on the aims were identified. Multiple passes of the data were made as new themes emerged from the analysis. New themes emerged about issues that hadn’t been considered initially. Data from each mystery was also evaluated to better inform and support planning of the following year’s mystery, to identify where additions or alterations to the mystery were required and initial aims strengthened and refined.

### **Findings**

Initially it was felt that we had created an engaging technology-rich environment that would disrupt traditional modes of teaching and learning and would support our pedagogical beliefs. However, as we implemented each mystery, tensions arose between our intentions with the technology and the realities. These tensions provided learning opportunities to re-examine and strengthen subsequent approaches. The findings with respect to the aims, stated earlier, often overlap as each finding impacted on the others.

### ***Engagement in learning***

A central aim for redesigning our 2nd year subject was to reignite and further engage in our university students’ learning. Utilising Coates’ (2007) aspects of engagement we built the subject being mindful of it comprising:

- active and collaborative learning;
- participation in challenging academic activities;
- formative communication with academic staff;
- involvement in enriching educational experiences; and
- feeling legitimated and supported by university learning communities.

At the outset of each mystery, many students' expectations were challenged. There was heightened interest in what they were experiencing and student engagement, at least initially, appeared high. The following example typifies students' initial responses:

*At the beginning of this semester, I was really intrigued and excited about what we were going to be doing throughout the first 5 weeks of this subject. (Kara)*

Student attendance, while not compulsory, was another measure of engagement and it remained consistently high throughout each mystery. The students felt the need to attend in order to receive new information and help other team members make sense of the new clues unfolding. High attendance was greatest in the third mystery when we increased the emphasis on physical clues being distributed face-to-face rather than all clues being delivered online as was the case in the first two mysteries.

However, the initial excitement that our pre-service teachers expressed in the sophisticated online environment we developed in the second mystery soon gave way to expressions of frustration and disenchantment as the technology failed to work. Key areas of the online environment were not ready or its full functionality was not available. Anxiety levels rose. Students revealed comments such as:

*It was very difficult when we initially started the subject as we had dilemmas with the technology and the wikis (Sean)*

The teaching staff shared the students' frustrations with the failure of the technology, However, in the next mystery, the technical issues were largely overcome and did not create the barrier they had in the previous year. Engagement was restored.

Unexpectedly, lecturer engagement was also high. We looked forward to each class, our teaching was reinvigorated and we were excited to employ new practices and to learn from collaborating with colleagues from differing disciplines. From Lecturer 1's Professional Journal:

*I haven't worked this hard on a subject in years yet I am enjoying almost every minute of it (when the technology is working). I'm also learning to teach more effectively. There comes a time in your teaching when you feel you are in command of your subject content and you are able to share it effortlessly. I now realise how dangerous this feeling can be. My engagement with this course comes from the myriad challenges I face moment by moment – just floating in a sea of unknowns, often dangerous risk-taking and the exciting collaboration with colleagues outside my discipline.*

### **Disrupting the norms of traditional schooling**

One of our key aims was to model a risk-taking pedagogy; one that focused on student-centered collaborative inquiry and problem solving, rather than on transmissive pedagogies and entrenched ways of "doing school." For example, we decided not to provide the expected detailed subject outline and schedule as we felt this would remove the sense of "mystery" that needed to unfold. Instead, we asked our students to trust us. Some did, as illustrated in this sample comments:

*This online introduction to the course is so much more exciting than the normal mode with the first lecture and tute. We have been listening to people tell us that virtual learning is exciting and a new method of teaching students to learn independently however this is the first time we are experiencing it ourselves. I think it's REALLY exciting and also will keep everyone tuned in over the next few weeks. I am looking forward to the clues and the rest of the mystery. (Pam)*

However, for some students, the lack of detail regarding the subject outline was a cause for initial anxiety, as typified in this comment:

*I am feeling uncomfortable and nervous as we have to wait anxiously for the information presented as the 'mystery unfolds'. This is definitely going to put me out of my comfort zone as I like to have all the information before plunge in. (Alicia)*

Underlying these concerns was the perception of learning as a fixed set of topics they were expected to learn and to regurgitate in assignments in order to obtain high marks, as suggested in the following two comments:

*I am so familiar with knowing exactly what I expect to get out of a course and what criteria I need to abide by in order to achieve good marks and the acquired knowledge intended. However this course was different, which was refreshing. (Mary)*

The use of role play as a major pedagogical strategy also challenged some students, illustrated in the following:

*I found that as the time wore on I felt a little silly continuing with the role play as not many others seemed to be into it. (Sally)*

*Despite the reluctance of some of our university students to actively participate in the role-play aspect of the subject, most perceived benefits from using such an approach with primary students Role playing allows us to be in a different dimension by taking on another person's character and role. With relation to the mystery where we are role playing certain characters and careers, we are taking on their knowledge and applying it to ours. Even though at times this could be difficult, incorporating role play in a classroom is great to get students thinking in a different viewpoint and seeing things from another persons view. (Kate)*

Students in this subject were allocated to groups, rather than self-selecting their groups. For many this was a challenge, however, most students recognised the benefits of this approach as typified by Donna's comment:

*Initially I found it a bit difficult to work with my team because we were all so different, not from the same group of friends and one of the girls I had never even seen before – let alone met! As we progressed though, I realised it was probably a good thing being just put into a group rather than choosing because it meant I challenged myself to get to know other people and I accept that we are always going to need to get along with people who bring forward different opinions, beliefs, work ethics and skills. (Donna)*

### ***Integrating technology in purposeful, authentic and student-centered ways***

#### **Student-centered use of technology**

We started with the premise that our pedagogical innovation needed to model student-centered pedagogies and authentic use of technology. A central idea of student-centered learning is that students have greater control over choice of subject matter, learning methods and the pace of their learning (Gibbs, 1992). Herrington, Oliver and Reeves (2003) argued that authentic learning activities:

- have real world relevance;
- are ill-defined, requiring students to define tasks and sub-tasks;

- comprise complex tasks to be investigated over a sustained period;
- provide opportunities for students to examine the task from different perspectives;
- provide the opportunity to collaborate;
- provide the opportunity to reflect;
- are integrated and applied across different subject areas and lead beyond domain-specific outcomes; and
- allow competing solutions and diversity of outcomes.

Our scenarios in all three mysteries met most of these accepted characteristics of authentic learning. Yet, there was little flexibility in the way the mystery unfolded since digital “clues” needed to be specified months before the scenario was implemented so they could be designed and produced by the web developers within strict timelines. The flexibility inherent in truly student-centered learning environments was sacrificed so that the next set of pre-determined evidence could be delivered. Students therefore had limited choice in the direction or pace their learning took. We initiated an improvement by placing more emphasis on the critical and creative interpretations of how the mystery may have ended and less emphasis on recounting the facts of each investigation.

#### **Authentic use of technology: Information delivery**

The design and online delivery of the mystery led us to believe we could disrupt the ways in which subjects are traditionally delivered. We believed the online material was somehow different, but in reality we were still disseminating teacher-created and directed information. In the first mystery, technology was used simply as a delivery mechanism, which was in contrast to our espoused beliefs about how technology could and should be used. In the second mystery all clues, in the form of multimodal learning objects, were delivered to the students online. But we had fallen into the trap of “glitzing up” (Yelland, 2007) how we delivered information to our students, even when there were times when it would have been far more pedagogically sound to deliver clues face-to-face. So much attention and time went into developing learning objects that we focused less on the important and more authentic use of technology such as the wiki space and discussion forums that pre-service teachers could use to collaboratively build knowledge through discussion, and build and test hypotheses. Our students reminded us of this in comments such as this:

*I believe that to reduce the impact of technological problems affecting lessons, some of the clues should be given in hard copies like actual newspaper articles rather than the use of wikis and the internet 100% of the time (Robbie)*

We decided to make significant changes to the blended delivery in the third mystery. We used far more role-play and paper-based evidence for students to analyse. We also handed over control far more and got the pre-service teachers to conduct more peer teaching and take more responsibility for finding information.

#### **Authentic use of technology: Collaborative knowledge building**

A wiki was the main tool used to support collaboration within and between the teams. At pre-determined points in each investigation, teams were asked to post hypotheses and conclusions on their wiki page, or solve problems that would lead to the next clue. At various points, teams were able to see other teams' wikis as a way of sharing ideas and of learning what was possible to create within the wiki environment. In the first mystery, we used a simple wiki. Students who had never heard of a wiki became familiar with its functionality and began to see the benefits of the collaboration it fostered, as illustrated in this student comment:

*Something that surprised me was the collaborative way my team worked in class but especially through the use of ICT and our team wikis. The way the wikis played a vital role*

*in the whole investigation. I was surprised at the way I relied on the wiki, and the reliance that my team held on the wiki for communication, organising our multimodal text, to delegate roles and even to just generally see how each member was going and their individual contributions to the mystery (Sarah)*

In the second mystery, the new wikis developed as part of the new online environment were not working until well into the investigation. This gave students time to develop other ways of communicating within their teams. Many preferred to use alternative and well-entrenched means of communication for the investigation - text, mobile phones, emails and face-to-face meetings, and Facebook:

*I found alternatives to accessing the mystery from home such as sending emails instead of wiki posts. (Jane)*

*Our team also kept in touch using Facebook as we found it easier to communicate using this tool. (MengFei)*

We also made assumptions that our students would know what a wiki was and how to use one. This was not a realistic assumption, despite the majority of our students being confident in using a wide range of digital technologies. The wiki became associated with “doing school” rather than being seen as a useful tool in itself. When students did use the wiki, many tried to use it in the same way they used Facebook, seeing each wiki page as a “wall” to which you post a comment, rather than seeing the page as a space you collaboratively build, compose and edit. Notes from Lecturer 2’s reflections showed:

*There is a strong reluctance to edit pages and put content on the pages. The preference in many teams is to establish a new page rather than change what is on an existing page, even if the content is focused on the same topic. There’s also a strong preference to use comments rather than edit a page – are the students happier to read chronologically rather than summarise and synthesise? (Lecturer 2)*

Once again, our expectations of what the technology might deliver and what actually happened were at odds with one another.

In the first two mysteries we analysed who made contributions to the wiki and found that the more technically competent and confident students were “taking the mouse” and doing most of the wiki work. This was not our intent. We wanted all participants to develop and build on their existing ICT skills. To improve this aspect, subsequently tasks were subsequently designed that required a different student to take the lead each week in adding to or modifying the wiki for their team.

## **Transformative Learning**

It was our intention that the pre-service teachers would be able to experience a new way of learning and then transfer that learning to their future teaching practice. Transformative learning developed by Mezirow (1995) over three decades ago has evolved to describe how learners “reformulate the meaning of their experience” (Cranton, 1997, p. 22, emphases added). Centrality of experience, critical reflection, and rational discourse are three common themes present in Mezirow's theory (Taylor 1998). For learners to alter and then apply specific beliefs and attitudes, “they must engage in critical reflection on their experiences, which in turn leads to a perspective transformation” (Mezirow 1991, p.167, emphases added).

We continue to find that pre-service teachers experience difficulty looking back on their university learning experience with a critical lens and then applying it to the classroom. This was

confirmed in the first year of the mystery when as a final assessment task students were asked how they would transfer this experiential learning to a primary classroom.

To assist them further, during the last two mysteries we attempted to spend more time in class and online in the discussion forum exposing our thinking as lecturers and the reasons behind our planning for the subject. We shared our beliefs that the opportunity for pre-service teachers to enact the content being covered in the subject under discussion meant that they could experience first hand some of what their students would experience. This allowed them to trust the experience far more. We also provided more opportunities to practise critical reflection. This assisted students' ability to transfer their learning. For instance, Huang-Lee relates the value of a team wiki in primary schools when she says:

*Children can gather all the information that they have and collaborate between them all. The use of the wiki allows the contribution of all students and all students are able to apply their own spin and ideas on the investigation.*

Ben's reflection below also typifies some of the transformational learning many students achieved.

*Throughout the [subject], I was undecided about how I felt I was learning and what exactly we were covering by doing this investigation. However, now that it's over I can step back and look at what we actually covered and learnt throughout the process ... I started to realise that maybe there was educational value in what we were doing. This started getting me thinking about the ways in which I could structure a classroom in the future. I like the idea of involving students in an investigation that blends the lines of the curriculum.*

Sadly however, because of our often sophisticated technology platform and designed interactivity in the mystery, the pre-service teachers were less able to envision ways to transfer those technological aspects to the primary classroom. As well, the sheer volume of technology used in the inquiry based mysteries made transferability to practical classroom use far less certain. Teachers would not have the time, the expertise or the available technology to make the mysteries solely a virtual reality. For example, Fiona recognised some of the difficulties when she said:

*One thing I've noticed during this subject is the amount of communication that is needed between team members. We might need to figure out another way for students to communicate - maybe through snail mail in the classroom? (Each group/student could have their own mailbox set up for other students to put their ideas/contributions into). If we are going to use this sort of learning in a classroom, we need to consider every eventuality when it comes to technology, as well as the students' access to the technology.*

If learning is change then our mission must be to foster and reward ethical change in beliefs and practices.

## **Conclusion**

Our initial aim was to design a university subject within a Teacher Education program that better responded to the needs of 21st Century learners. The benefits of our approach were many. We successfully disrupted some of the norms and expectations of university teaching and learning in order to interrogate them further. Attendance was generally high at lectures and tutorials as students appeared eager to receive their next clues and anxious to solve the mystery. Discipline knowledge was bridged and appeared seamless. Students were immersed in the mystery, their work in teams had authentic purpose and they employed multimodal ways of knowing. As well, while students were taken out of their comfort zones this was undertaken in a safe and supportive environment. Lecturers and tutors were far less traditional in their approaches to university teaching often conducting interactive lectures in role with new evidence provided. An unexpected

benefit was how the mysteries provided an enriching experience to the teaching team as we crossed disciplines, planning and teaching together. It was fun for most participants to engage in the mysteries but not always “hard fun.”

The challenges allowed us to better understand how to modify our approach in subsequent years. Our students found it difficult to transform their experience to their teaching practice as they would not have the available technologies. As well, the technology often directed the subject of the mystery.

Much of the focus of current learning and teaching places technology at the forefront. Laurillard (2002) warned us that decisions about educational technology should be driven by teaching aims rather than technology for its own sake. While it is essential to reform university teaching, we are cognisant of the need to be critically selective and thoughtful about what technology is used and how it is used. We are also aware of how much control we are prepared to give over to our students and their readiness and willingness to take over the control. We embrace, and continue to respond to Postman’s (1993) prescient statement that: “*Most people see only what technologies will do but are incapable of imagining what they will undo*” (p. 5, emphases added).
