Development of democratic teacher behavior scale (DTBS)

Gülsen Özcan

Abant İzzet Baysal Üniversitesi, Bolu, Turkey.

Received 17 November, 2015; Accepted 11 February, 2016

This study aims to develop an instrument that could be used to measure democratic teacher behavior in a valid and reliable manner. The research was carried out in fall semester 2014 to 2015 with a total of 500 high school students recruited from four different schools. Expert opinions were obtained to determine the scale's content validity and face validity. Additionally, exploratory factor analysis and confirmatory factor analysis were performed to assess the construct validity of the scale's measures. Confirmatory factor analysis yielded a construct that is consisted of 17 items and three factors that explained 46.85% of the total variance. These factors were: participation, curriculum and Relations. Findings obtained from confirmatory factor analysis demonstrated that the construct with 17 items and three factors had adequate fit indexes. The reliability of the measures obtained using the three subscales were examined via cronbach alpha, which produced reliability coefficients that fell within acceptable limits. Based on the research results, it can be stated that the scale is an instrument that produces valid and reliable measures, and that can be used to determine democratic behavior of teachers. Suggestions for future scale development efforts on democratic teacher behavior are outlined.

Key words: Democratic teacher, democratic education, behavior, scale, high school.

INTRODUCTION

Given the recent social, political and technological improvements in the world, geographical borders have almost lost their importance. Hence, people can change their location easily, communicate with other people across the globe as well as share the distinct culture globally in pluralistic societies, which make democratic education even more significant.

To date, the notion of democracy and democratic education have been documented as universally crucial factors encompassing the values such as freedom, equality, justice, respect, tolerance, reconciliation, and becoming rational (Doğan, 2005; Morrison, 2008; Subba, 2014; Tannebaum, 2015). Dobozy (2007) defines democratic education as a medium where students are treated equally regardless of their social background. This medium is based on the notion that people are equal in terms of value and that they should be treated equally by law and justice. In this regard, equality in education is not only to provide people to attend schools with the equal chance but to provide them with equal opportunity; to
enable them to improve their skills and to contribute to their accomplishments with the allowance of equal chance. Furthermore, Morrison (2009) emphasizes that democratic education can be provided by inner-class practices in the micro level, and by the practices in the school in the macro level. Similarly, Ritter (2010) remarks that teaching others how to teach democratic citizenship represents a process as teachers are the ultimate instruments of change.

Researchers in this field dealt with the aim of democratic education from a range of perspectives. They classify the aim in two main categories: the one that serves individual development and the one that serves social development. In this sense, the aims such as developing personal responsibility (Beane, 2005; Parker, 2003), developing the ability to solve problems (Barber, 1998; Goodlad, 2002), developing critical thinking, developing self respect and self control (Knight, 2001; Mac Math, 2008) fall in the first category. On the other hand, the latter category includes the aims such as developing social responsibility, developing the habit of working together (Vinterek, 2010), the participation in decision making, questioning, developing empathy (Aktan and Vural, 2003; Karakütük, 2001), respecting others’ opinions, religious belief and gender or spouse preferences (Kubow and Kinney, 2000; Lappé, 2006; White et al., 2007).

Democratic medium in a class is an important aspect affecting human behavior. The medium in a classroom does not only provide the student accomplishment but also enables students to improve their democratic attitude toward others. The teachers who create a fair, tolerant and flexible classroom setting and utilize the instructional variables such as feedback, correction, reinforce and clue effectively can perform the sort of positive class setting. In such a setting, students can perform the tasks given at a desired level and they can carry on focusing on the subject matter throughout the course (Trent et al., 2010). In this vein, democratic medium and the visions of democratic teacher have interacting roles in students’ conceptions of democratic behavior. Yeşil (2003) highlights seven significance in democratic education as follows:

1. Physical dimension
2. Knowledge dimension
3. Decision dimension
4. Freedom of expression dimension
5. Freedom of participation dimension
6. Social relations dimension
7. Responsibility dimension

Yeşil (2003) explains each component in detail and he points out that “physical” component refers to the medium of education that enables students to improve their skills. “Knowledge” component refers to the preconception of students’ rights, freedom, their responsibility as well as the outcome of their performances. As the third component, “decision” means the precence of the rules to follow in a classroom practice and the acceptance of the underlined rules by the whole students. The researcher divides freedom into two as freedom of expression and freedom of participation. While “freedom of expression” means that students should be able to express themselves based on the norms accepted by human rights, “freedom of participation” means students’ active participation throughout the classroom practice in the process of decision making. Occupying the sixth dimension “social relations” is the dimension through which the importance of values such as respect to human rights, justice, co operation, responsibility in teacher-student as well as student to student relations is emphasized it is also underlined that interaction in a democratic education medium should be pursued within the framework of democratic rules. “Responsibility”, the seventh dimension, refers to the responsibilities inherent in freedom and also the balance of freedom and discipline. When we consider all the dimensions outlined above, it is obvious that the responsibility to foster democratic behavior falls upon educators.

Researchers have advanced our understanding about democratic education by classifying a democratic classroom setting into four main components being realized in education programs. The first component, “participation”, refers to take part in decision making on the issues related to them in a society (Dewey, 1970/2010a; Gutmann, 1999; Kubow and Kinney, 2000; Print et al., 2002; Rainer and Guyton, 1999; Riley, 2011). The second component, “curriculum”, covers the participation of the students into the classroom rules and predetermined decisions given in a class. Students reflect their opinions both in evaluating and determining the aim of the course, selecting the content, method, technique to be focused (Arabaci, 2005; Girgin and Gürşimşek, 2004; Morrison, 2009; Print et al., 2002; Riley, 2011). The third component is “relationships” (Arabaci, 2005; Gimbert, 2002; Kubow and Kinney, 2000; Mac Math, 2008). The fourth component, “teacher”, refers to the person who undertakes the crucial responsibility in acquiring democratic behavior in a class setting (Print et al., 2002; Mac Math, 2008; Riley, 2011).

The key responsibility for creating a democratic education environment at classroom level certainly belongs to teachers. Democracy should be an integral part of teachers’ instruction in a classroom setting. Hence, they should act in line with a democratic ideology, and constitute a role model to the students through their model role of democratic behavior (Subba, 2014). A democratically minded teacher should give equal chance to students in determining the rules in a class. In other words, students’ equitable access in forming the shared norms in education is of great importance (Darling-Hammond, 2006; Hostetler, 2012). What is more, the teachers should be able to inform and get the students...
the acquire knowledge pertaining the reasons or contributions of behavior rather than punishing or rewarding them. As a democratic leader, a teacher should motivate students, getting them to participate in the process of active learning, and they should be able to present the variety of activities to students, getting their opinions during the practice of teaching (Başar, 2004; Parker, 2010).

In literature, there have been studies on developing scales to measure teachers’ democratic behavior. For example, Shechtman (2002) developed a scale “Teachers’ Democratic Belief” to obtain their democratic beliefs. The scale is composed of 34 items and three factors named freedom, equality and justice. Cronbach alpha measures of the subscales are in the range of .63 to .66. Dealing with the teacher- student relations in a classroom setting, Drugli and Hјmdal (2013) developed a scale called “Factor Structure of Student-Teacher Relationship Scale”, yielding three subscales as closeness, conflict and dependency. The scholars, Readey et al. (2013) developed a scale of classroom strategies consisting of four subscales names as student focused on learning and engagement, instructional delivery, promoting student thinking, and academic performance feedback. Reliability of the scale is reported to be 0.92. On the other hand, Kan (2013) conducted a study at a secondary school and developed “Scale of Equal Behavior In A Class”.

The study found four subscales as emphasizing equity in a class, equity toward individual differences, establishing self confidence, objective behavior. The measure’s Cronbach alpha coefficient was found to be 0.94. In another on teachers’ democratic behavior, Gözütok (1995) adapted the scale into Turkish developed by Schwarts (1992). It was found out that the measure of Cronbach alpha coefficient was 0.87. The scale administered to the students using 5-point Likert type grading is composed of 50 items. Similarly, Korkmaz and Gümüşeli (2013) developed “Scale of Medium of Democratic Education” for primary, secondary and high school teachers. The scale is composed of 75 items and three subscales labelled as decision-making, curriculum instruction and teacher-relations. The measure of the scales’ Cronbach alpha coefficient was found to be 0.94. Dealing with democratic values, Çermik (2013) developed “Scale of Democratic Values” composed of 17 items and four subscales as checking right for instances, respect to differences, justice and equity. The scale was administered to pre service teachers, yielded the measure of Cronbach alpha coefficient as 0.84. Kiroğlu et al. (2012) developed a scale of “in class tolerance” that was administered to instructors at a university. The scale was composed of 13 items and three subscales, the measure of Cronbach alpha was found to be 0.74. Yeşil (2010) developed a scale named “Determination of a Democratic Teacher Behavior” which was administered to secondary school teachers. The scale is composed of one subscale and 69 items, the measure of Cronbach’s alpha was found to be .98.

Apart from the scale development studies, there have been some other studies regarding democratic teacher and their behavior. Studies were conducted in the form of surveys, open ended questions as well as the studies where the scales are utilized (Bayındır et al., 2010; Cavkaytar, 2013; Dündar, 2013; Genç, 2006; Gümlekız ve Çetintaş, 2011; Güven, Kaya and Aslan, 2014; Kayabaşı, 2011; Karatekin et al., 2013; Topkaya and Yavuz, 2011; Yiğit and Çölaş, 2011).

To the best of the study knowledge, there have been succinct studies dealing with democrat teachers in a classroom setting. The purpose of this study is to develop a valid and reliable scale that could be used to measure “Democrat Teacher Behavior” (DTB). The study aim to contribute to student centered evaluations of teachers and facilitate democratic practice of instruction by empowering teachers. Additionally, it will contribute to the understanding of teacher profiles in relation to democratic behavior in Turkey.

**METHODOLOGY**

**Participants**

The present study was administered to a total of 500 students from two different state schools selected by random sampling method, located in Bolu, in Turkey, in the fall semester of the 2014 TO 2015 academic year. 400 students formed the first test group. Exploratory factor Analysis (EFA) was performed on scale items based on the students’ answers. In order to verify structure validity of the 20-item scale, the scale items were given to another group of students consisting of 100 high school students for the second test group. Confirmatory factor Analysis (CFA) was conducted on the scale administered. A total of 18,675 students attended high schools in Bolu during the 2014 to 2015 academic year (8,816 female, 9,859 male) www.meb.gov.tr. Regarding the number of participants that should be included in factor analysis studies, Yazarçığlı and Erdoğan (2004) states that when the sampling ratio of the population is about 10,000 to 25,000, and that it is in the range of sampling error of 0.05, 270 to 280 participants could be acceptable. On the basis of meeting the criteria, it can be acceptable to recruit a total of 500 students, which make up the sampling of this study. The distribution of students both in the first test and the second test application of the scale are shown in Table 1. As seen in Table 1, there were 87 girls (36.4%) and 61 boys (38.4%) in the first school, 71 girls (23.7%) and 46 boys (28.9%) in the second school, and 81 girls (33.9%) and 52 boys (32.7%) in the third school. CFA was conducted in the fourth school for which 41 girls (41%) and 59 males (59%) participated.

**Developing items of the scale**

Initially, literature in this field was reviewed to form the items that would take place in the scale. Based on the review, democratic teacher behavior was summarized under the headings of democratic school, democratic class setting and dimensions (Dewey, 1970/2010a; Hostetler, 2012; Kubow and Kiney, 2000; Print et al., 2002), democratic belief and democratic attitude (Korkmaz and Gümüşeli, 2013; Selvi, 2006; Subba, 2014; Yeşil, 2010). While writing the items of the scale, key concepts related to democratic teacher behavior were verbalized. Furthermore, 28 high
school students, representing the group for scale application, were requested to answer an open-ended question “how should a democratic teacher treat the class?” The answers obtained from those students gave insights on developing the items of the scale. The students’ answers were combined with the data in literature, and a pool of items was established, consisting of 40 items. In order to obtain the content validity and face validity, five experts’ opinions at the university level were obtained: one from the field of democracy and human rights, three experts from program development and another expert in the field of program evaluation. On evaluating the feedback provided by the experts, the scale that initially was composed of 40 items was reduced to 30 items, and the final form of the scale was obtained for the test application. For the items in the scale, a 4-point Likert-type scale was used: None of them behaves so (1), Some of them behave so (2), Most of them behave so (3), All of them behave so (4).

Exploratory factor analysis and findings

Factor analysis is a statistical analysis method to summarize data so that patterns and relationships can be interpreted. This method is used to regroup variables into limited set of clusters based on shared variance. Thus, it helps to isolate constructs and concepts. Factor analysis utilizes mathematical procedures in simplifying interrelated measures to enhance patterns in a set of variables (Bartholomew et al., 2011; Child, 2006). There are different opinions regarding the number of the participants that should be included in factor analysis studies. Comrey and Lee (1992) suggest that 100 participants is an insufficient number, 200 is mediocre, 300 is good, 500 is very good, and 1000 is perfect (Akbulut, 2010). On the other hand, Kline (1994) argues that 200 is generally satisfactory to obtain reliable results from the factor analysis, but in cases where the factor structure is clear and small, this can be reduced to 100; however, working with large samples is more appropriate. In estimates of appropriate sample sizes for use in factor analysis, meeting at least two of the criteria available in the literature is recommended (Coklu et al., 2012).

Cattell (1978) suggests in his factor analysis studies that the participants as many as 3 to 6 folds of the number of items in the scale should be included in the study group, and characterizes that 200 participants is acceptable for factor analysis. Hair et al. (1979) find it sufficient that the participants as many as 20 folds of the number of items in the scale are included in the study group. In the present study, 400 participants for the first study group were recruited for the EFA. According to criteria given earlier, it can be stated that the number of participants in this study is sufficient for factor analysis. Another operation that needs to be performed for the same purpose is the examination of the Kaiser-Meyer-Olkin (KMO) value as well as Barlett’s test. The data are deemed suitable for factor analysis when KMO values are above 0.60., and when Barlett’s test is statistically significant (Buyukozturk, 2013). A factor load value of 0.45 or higher -an important value in factor analysis- is acceptable value for the selection. However, this value could be decreased until the level of 0.30 in application for low number of items (Buyukozturk, 2013).

In the present study, as a result of the first analysis based on EFA, the items whose factor load values were over 0.40 were included in the scale. In addition, the items whose values were close to one another in two factors were excluded from the scale. Therefore, 20 items remained in the scale. The 20 scale items were included in factor analysis again by using varimax changing technique, which is a vertical changing technique. Varimax and Quartimax, which are vertical changing techniques, are used in social sciences in scale development generally (Buyukozturk, 2013).

As shown in Table 2, the KMO value is 0.88. This value is quite higher than 0.60 limit value which is found appropriate for the KMO value. This indicates that the research data are appropriate for factor analysis. According to Bartlett test result, p= 0.000<0.05. This value is a significant value for 0.05 of significance level.

Determination of the themes in the scale

According to the result of EFA test conducted based on KMO and Barlett test, a 20-item structure was obtained along with three factors. By examining the contents of these items and by considering the literature on democratic teacher behavior, factor names were decided. The factor loads and factor common variances of the items that were obtained in the fundamental components analysis are shown in Table 3 and Figure 1.

As seen in Table 3, the scale about the 20 questions is made of three factors. There are 10 items in the sub factor, 6 items in the second sub factor, and 4 items in the third sub factor. The factor loads of the items in the participation sub factor are between 0.43 and 0.70. Factor common variance varies between 0.23 to 0.55. The factor load values of the items in the program factor are between 0.42 to 0.72. Factor common variance changes between 0.43 to 0.56. The first of the three factors in the scale explains 21.45% of the total variance about the scale, and the second factor explains 13.06% and the third factor explains 12.33%. The total variance explained by the three factors is 46.85%. The

CFA was applied to assess whether the second group’s data would justify the EFA results obtained from 20 items and three factors. It was observed that the conformity indexes of the scale reached the acceptable values when the first and ninth item in the participation factor and the second item in the program factor were excluded. The load values change between 0.23 to 0.58.

Confirmatory factor analysis and findings

CFA was applied to assess whether the second group’s data would justify the EFA results obtained from 20 items and three factors. It was observed that the conformity indexes of the scale reached the acceptable values when the first and ninth item in the participation factor and the second item in the program factor were excluded. The load values change between 0.23 to 0.58. As shown in Table 4, CFA results range from perfect fit to acceptable fit. Table 4 demonstrates the acceptable and perfect fit values, which were examined in order to test the adequacy of the model, as well as the fit index values obtained from the CFA, as well as the relevant results. The criteria used for acceptable and perfect fit indicate that the model with three factors obtained from the CFA fits (as shown in Table 4). Pearson Correlation coefficient (r) between 0.00 to 0.25, there is a very weak relationship between the factors, a weak relationship between 0.26 to 0.49, moderate relationship between 0.50 to 0.69, a high relationship between 0.70 to 0.80, and a very high level of relationship between 0.90 to 1.00. There is moderate relationship between the factors according to this table.

Reliability of the measurement instrument

Another characteristic that needs to be present in a measurement tool is the reliability coefficient showing the consistency of the measurement tool. Crombach alpha reliability coefficient of 20 items was as a result of the second application being 0.85 in the participation factor, 0.78 in the program factor, and 0.85 in the relationships factor and 0.68 in total. On the basis of the results, it can be stated that the scale is reliable.

RESULTS

This study aimed to develop a scale to measure democratic behavior levels of high school teachers. EFA and CFA were conducted to measure the construct validity of the scale. CFA yielded a construct that is consisted of 17 items and three factors that explained 46, 85% of the total variance. These factors were named as “participation”, “curriculum” and “relations”. Fit indexes of the model obtained were examined in CFA performed, and it was observed that DTBS’s fit index values were as follows: CMIN/DF, 1.147, GFI; 0.87, CFI; 0.97, RMSEA; 0.039’. Cronbach Alpha coefficient of the scale with its final form was 0.85 in the participation factor, 0.78 in the program factor 0.85 in the relationship factor and 0.68 as a total.

These results are in the range of 0.60 to 0.80, which is aligned with Alpar’s (2001) statement of quite reliable. On the basis of the results, it can be stated that quartet likert type scale that was developed has the validity and reliability to measure democratic behavior of teachers serving in high schools in Turkey.

DISCUSSION AND CONCLUSION

This study aimed to develop a scale to measure teacher behavior in relation to their being democratic. Teachers who have not adopted democratic behavior style cannot be expected to raise democratic students. A number of reserachers emphasized that teacher behavior has an important impact on students (Jeans, 1995; Wenglinsky, 2000) yet, no studies were found scrutinizing democratic behavior of teachers based on student evaluations. Aydoğan and Kukul (2003) argued that elementary and secondary school teachers referred to students’ opinions at an “intermediary” level in the selection of lessons taught in the classroom and target, content, method and tools of other activities. They remarked that elementary school teachers were more democratic for considering the opinions and suggestions of the students who were minority in the classroom in terms of thought.

Duman and Koç (2004) pointed out that the democratic behavior was quite moderate or in poor level. Angell (1998) stated that the students’ understanding of expressed opinion about the democratic teacher behavior reflected the key entities such as information sharing, respect, creating opportunity for the development of skills, empathy, and being equal and fair. Pohan (2003) in a similar study, asserted that characteristics such as making a decision based on participation, liberal approach, and sensitivity to sociological phenomena are the attributes of a democratic teacher. Pryor and Pryor (2005) concluded in their research that acceptance of differences, creation of safety feeling, honesty, ethic norms, and equal and fair act were the foundation of democratic teacher behavior. Saraçoğlu et al. (2004) emphasized that although the instructors agreed on democracy principles, they were not able to reflect these principles in class, which indicates that further studies of democratic teacher behavior is called for.

In the present study, democratic behaviors of teachers based on student perception were questioned and it is thought that the study will contribute to the field as teachers should adopt democratic behavior in the context of education and pursue the attitude for the future generations. Furthermore, evaluation of teacher behavior by students seems to be worthwhile as a part of its democratic nature inherent within itself. Additionally, secondary school teachers’ employing democratic behavior in Turkish context will add to the growing body of literature and shed light on developing better democrat behavior of teachers in diverse societies.

As it is the case in many studies, this study had some limitations. Because the scale was conducted with the students in four secondary schools in a city of Turkey, it may not be generalized to all cities in the country. Therefore, further studies with greater number of sample including several other regions and cities in the country are suggested so as to increase the scale’s external validity.
