Mediated-Efficacy: Hope for “Helpless” Writers

By Eileen Kogl Camfield

ABSTRACT: Building on previous studies of college students’ writing self-efficacy beliefs, this article presents the empirical foundation for a reconceptualized understanding of this identity process. The study assessed 131 college freshmen enrolled in a developmental writing course who were evaluated holistically using grounded theory methodology. The study identified (a) major theoretical categories revealing the nature of students’ initial pessimism about themselves as writers and sense of learned helplessness and (b) a subsequent shift toward optimism and self-efficacy triggered by a particular learning relationship formed with their instructors, the core of the posited mediated-efficacy theory. Implications for college-level developmental writing pedagogy are explored.

Perhaps because of the seemingly magical act of making words appear on blank paper, some student writers and college teachers underestimate or misunderstand the complexity of the writing task. As a result, students can misinterpret their struggles as mere laziness (McLeod, 1987). In addition, teachers can conflate “writing-like” activities (e.g., grammar worksheets) with “actual writing” and, thus, mistake their roles as being primarily “language cops” (Newkirk, 2009, p. 50). In truth, composition scholars are clear: Writing is a complex literacy task that develops slowly and often idiosyncratically (Carroll, 2002); it involves embracing the contrary dispositions of open exploration and of rigorous critique of ideas (Elbow, 1983). Bruning and Horn (2000) described writing as “a tremendously complex problem-solving act involving memory, planning, text generation, and revision” (p. 26) that engenders unique motivational challenges. Such challenges may be amplified for college students who labor under the additional burden of stigma associated with placement into “remedial” courses (Arendale, 2005). The National Council of State Legislatures reported anywhere between 28% and 40% of college students are placed into remedial classes (Bautsch, 2013). Given that only 17% of this demographic complete a bachelor’s degree, finding ways to optimize developmental writer success takes on a new urgency. This article reports on an effective new initiative undertaken at a midsized, private four-year college. Although course design elements are briefly mentioned, the impact of this initiative is primarily articulated through the students’ own writing to describe their growth over the semester.

Theoretical Context: Motivation and Self-Efficacy Theory

Bandura’s (1986, 1997) influential sociocognitive theory of self-efficacy and motivation posited that the beliefs people hold about their capabilities can better predict their behavior than their actual abilities can. He described a recursive phenomenon by demonstrating that senses of self-efficacy influence the choices people make, the amount of effort they expend on a given task, their persistence in the face of adversity, the way they intellectually conceptualize tasks, and the way they respond emotionally to challenges. He emphasized that these beliefs are not innate but are derived from external sources: mastery experiences, social comparison modeling, labeling and feedback received from others, and physiological states of anxiety or calm. Each of these can affect an individual’s sense of agency.

Writing Self-Efficacy and Student Performance

Subsequent research has shown that the educational importance of self-efficacy beliefs should not be underestimated. These beliefs can affect career choices and “are correlated with other motivation constructs and with students’ academic performance and achievement” (Pajares, 2003, p. 141). Notable for this study, is the degree to which self-efficacy beliefs influence a developmental writer’s performance. As one pioneer research team in this field concluded:

If writing difficulties result not only from an inability to solve writing problems, but also from one’s own decision that one is unable to solve them, then one important step in improving writing would be to strengthen individuals’ self-efficacy expectations about their writing ability. (McCarthy, Meier, & Rinderer, 1985, p. 466)

Indeed, in the years since the concept was created, many studies have clearly linked writing self-efficacy...
beliefs to student achievement (Pajares, 2003; Prats-Sala & Redford, 2012; Shell, Murphy, & Bruning, 1989), as well as linking self-efficacy beliefs to various teaching or assessment strategies (Bruning & Horn, 2000; McLeod, 1987).

One common denominator in all of this research is the degree to which scholars have relied on quantitative tools to measure student beliefs. Several compositionists have developed writing self-efficacy scales, usually brief questionnaires or surveys asking students to rate their writing capabilities (McCarty, Meier, & Rinderer, 1985; Pajares, 2007). Such scales are easy to score and have been well-tested over the past 30 years as reliable and valid measures of self-efficacy. However, the dominant methodologies used to study student beliefs underpinning self-efficacy have been somewhat limited: Either they have focused too exclusively on student performance and too little on process, or they have only examined one dimension of student self-efficacy development.

Certainly, showing connections between self-efficacy beliefs and writing performance is important. Of equal importance is knowing what actually causes or limits self-efficacy development, how students experience the act of writing, and why self-efficacy affects performance. Although correlations between using a particular teaching strategy and efficacy gains might exist, other (perhaps multiple) factors might be the actual source of those gains. Moreover, scales are reductionistic instruments, subsuming all of the writing process into a Likert-scale.

focus on concepts that fit and are relevant” (Glaser, 2012, p. 28) to the actual process under investigation. This research study attempts to shift the focus from particular pedagogical interventions and instead develop a metaunderstanding of the multiple and synergistic sources of writing self-efficacy development. Other scholars have recognized grounded theory has particular value in composition studies because “it doesn’t require us to simplify the complex acts of writing and teaching” (Migliaccio & Melzer, 2011, p. 79) and leads to conclusions that have relevant applications to practice.

Methodology

In this case, to capture exactly “what is going on” (Glaser, 2012, p. 28) for first-year developmental writers, the instructional team (of which I was the lead) analyzed narratives written in the first and last weeks of the semester. By allowing students to write freely, more authentic themes could be uncovered than might otherwise be formed using researcher-generated interview or survey questions. That said, students were also surveyed through a learning inventory at the end of the semester to triangulate findings from the narratives. This survey provided both confirmation and further insight into student experience of the class. However, the team’s primary interest was in the open-ended narratives because they provided unprompted, learner-based evidence. The narratives revealed the specific components of learned helplessness students brought into their first-year composition course and subsequently demonstrated how students experienced gains in writing self-efficacy. Writing instructors must understand the dimensions of this learned helplessness before they can begin to select appropriate pedagogical strategies for facilitating student empowerment.

Research Context and Background

To better align with Core Principles for Transforming Remedial Education (Center, C. A. D., 2012), in 2013 my university piloted a revised approach to the developmental writing program. Previously, incoming students whose SAT scores indicated they were underprepared in writing were required to complete a sequence of developmental courses before taking the interdisciplinary first-year seminar, which also serves as the college-level writing requirement for all incoming students. In 2013, the university launched a new program in which freshmen who tested slightly below the cut score in writing (SAT-writing score between 450 and 500) were mainstreamed into special sections of the first-year seminar course and provided a weekly supplemental 100-minute studio aimed at delivering intensive writing instruction, practice, and feedback. To remain consistent with the tenants of grounded theory (Glaser, 1992), beyond this “developmental writer” designation, the instructional team did not assume the relevance of any particular demographic data as we examined the student pool. Nevertheless, demographic data related to students enrolled in Freshman Seminar were examined to provide context for the reader (see Table 1, p. 4). Further, according to the Cooperative Institutional Research Program (CIRP Freshman Survey, 2013) for the 2013 class, the institution’s students consistently under-rated their knowledge, skills, and abilities in comparison to other institutions with 26% anticipating need for special tutoring or remedial work in writing (nearly twice the number than for those at comparison schools). A high proportion of these students were also low income (Kelley, 2014). In short, from the outset the cohort reflected several “at risk” markers as well as the attendant affective self-beliefs that often accompany membership in such a group.

To understand the scope of this study, readers should also note that the experienced instructional team embraced increasing student writing self-efficacy as the single most important learning outcome for the studio portion of the course. Initially, various learning outcome options were considered, but discussion at the summer-planning faculty meeting led to a consensus-decision that to optimize any other learning, writing self-efficacy had to come first. The team chose not to test any particular curricular or pedagogical intervention; instead instructors...
attended a workshop where they honed their general understanding of self-efficacy development mechanisms. Therefore, the pedagogical context for this study diverges from most previous research, which has focused on a discrete change. Given the self-efficacy gains all students demonstrated across all sections, this approach seems to not only have been effective but suggests that self-efficacy development is less about any particular teaching technique and more about other, larger factors. Moreover, although the instructional team was concerned about student performance, team members were also aware that it is often unrealistic to expect to see measurable gains in writing ability over the course of just one semester (Carroll, 2002). Therefore, one of the primary foci was the degree to which students’ senses of writing self-efficacy, independent of writing ability, were detectable in a single semester.

**Pre- and Postwriting Narratives**

At the very first writing studio meeting of the semester, students were asked to write for 50 minutes describing their strengths and weaknesses as writers, drawing on personal experiences to illustrate their points. This sample (n = 131) served as a narrative pretest, informing the instructional team about the levels of writing self-efficacy students had upon entering the class. At the end of the semester, these same students repeated this identical writing exercise with the added instruction that they should think about their strengths and weaknesses in light of what they had experienced over the course of the semester. The instructional team evaluated and coded these pre- and postnarrative course of the semester. The instructional team was concerned about student performance, team members were also aware that it is often unrealistic to expect to see measurable gains in writing ability over the course of just one semester (Carroll, 2002). Therefore, one of the primary foci was the degree to which students’ senses of writing self-efficacy, independent of writing ability, were detectable in a single semester.

**Results**

**Theme One: Barriers to Self-Efficacy**

Almost all of the students began with good working vocabularies to describe effective writing, meaning their struggles were not for lack of conceptual awareness but had to do with a perceived inability to apply these elements to their own writing. Further, it was sometimes hard to distinguish between cause and effect because of the recursive way self-efficacy develops or fails to develop. That said, the four categories identified here—disengagement, fear of judgment, conflation, and collapse—came from those things students described as their “weaknesses” as writers. Notably, as these categories come from writing students did on the first day of class (the pretest), they must refer to their high school experiences.

Such information is useful because sometimes college teachers fall into a tabula rasa trap: Instructors don’t know what educational contexts their first-year students have come from, and even the students themselves, seeking a fresh start, can be eager to jettison the past. But this past can affect the present and impede teaching and learning effectiveness.

**Disengagement: “Boring topics about books you didn’t like.”** Many students described struggling with the “weird” topics their teachers provided on which they were required to write. Jennifer recalled starting life with a “fascinating dream of becoming a writer. I loved writing for pure fun and creating stories”; however, something changed once

Their struggles had to do with a perceived inability to apply [conceptual awareness].

she entered high school, “Having a teacher assign you a boring topic about a book you did not even like reading crushed every last hope I ever had for becoming a writer.” Students perceived such topics as limiting their creativity and range of expression. Mario reported, “My teacher knew ahead of time what my answers were supposed to be.” There was no hope for engagement: “I almost couldn’t care less about [high school essay prompts].” Writing was done to please someone else in order to fulfill an extrinsic agenda. It was seen as “regurgitation,” not exploration, “not fun.”

Fear of judgment: “A long scary roller-coaster.” Compounding the problem of rigid and narrow essay topics was the student sense that their writing was going to be harshly judged. Jennifer lamented, “I feel I have just been beaten down with everything I have ever written.” Many had the sense that they were being set up to fail and that their teachers took pleasure in inflicting that failure. Tara described: “Writing felt like going on a long scary rollercoaster with the Grinch anxiously waiting on the other side to judge me.” She saw herself as out-of-control and headed into certain doom. Thus, judgment seemed impossible to predict or control. Regardless of who or what was doing the actual judging, many felt what Jennifer observed, “There has been no positive feedback for a long time.” Mario described being “weighted down by a red pen of death.” Sara commented, “Every time I received a paper back from editing, it would always look like someone had accidentally splattered ink on my paper.” Her adverb choice indicates that this kind of feedback felt random and casual; for her, editing is accidental and messy.

Conflation: “My handwriting is horrible, so I’m a bad writer.” Likely because of a sense that everything was open for arbitrary attack, students reported that they were often unable to discriminate parts from a whole. To them, “grammar” was the same thing as “writing.” Consequently, students sometimes confused or conflated writing elements: Mario saw content as the same as style; handwriting and page formatting were as significant as thesis. In essence, writing was a single daunting monolith.

Collapse: “I have faith in myself at first, but soon accept defeat.” Because students perceived writing as an overwhelming monolith, most exhibited a lack of coping strategies for dealing with the natural setbacks that are part of the writing process. Jorge called it “hitting a brick wall.” From the specific, “In my head an idea will be there and I can put it on paper easily, but revising it is a whole other story,” they leapt to the general, “Writing is just something I can say I am not that good at.” They had little awareness of techniques that could be mastered that might help. Instead, students described many states of being stuck, “If I don’t get stuck at the very beginning, once I start I still don’t know what to write.” Being stuck led to a lack of resilience. Maggie reported, “The moment I hit a writer’s block, I disintegrate in my seat, doubt myself and almost feel obligated to accept defeat and failure.” Although she did not clarify to whom she felt that obligation, her lack of agency was striking.

Part of the reason for these underdeveloped coping skills may stem from an inability to self-assess one’s work. Mark wrote, “I wonder if this essay will come up to pass the college level requirements, or if I am just being a Nervous Nelly. I don’t really know what my writing strengths and weaknesses are.” Some students knew they were grappling with old patterns that needed to be unlearned or modified in the new college context, “It has become a habit for me to restate what the author has already said.” Others recognized that specific kinds of writing were particularly vexing. For example, many talked about the anxiety they felt when asked to perform on-demand, timed writing. Such anxiety could be compounded by a tendency to compare oneself unfavorably with others. Maggie said, “During the SAT exams, I belittled my writing abilities because the scurrying of others’ pens made me nervous that my essay was not as good. I have faith in myself at first, but soon accept defeat.”
Increased coping skills: “What helped me most was going in and talking.” By semester’s end students had developed much stronger coping skills linked to a stronger sense of connection in a learning community. Many identified one-on-one conferences with their professors as transformative. Kim, who exhibited the least writing self-efficacy at the start of the semester, ended it asserting “I feel more comfortable about writing now and loved being able to come in and get help on several drafts to get the essay shaped into a strong piece that would get a good grade.” True, she is still concerned about her grade, but that comes last in the series; her feelings of comfort, love, and ability to receive help come first. Quite a contrast to the pessimism and negative emotions she expressed previously! Many others wrote about the support systems they forged with both professor and peers. Valerie observed, “Peer reviews help me a lot. They have helped me understand that it’s not always going to be perfect at first, but with revision it can almost get there.” Chris admitted that he “used to just slap facts into my papers and thought that I was done.” He credited peer-editing workshops for the fact that, with a larger sense of audience, he is now “delving deeper into the topics I’ve chosen.” Jorge noted, “I believe a strength I developed from this class is to use your resources as much as possible.”

Many students discovered these sorts of resources and identified their utility in two dimensions: They came to see writing as a sum of manageable parts, and they became more accurate in self-assessment. Instead of globalized “bad writer” self-labeling, in recognizing concrete things that could be done to improve they also developed more accurate understandings of their weaknesses as writers. Eduardo noted, “In order to get better, you have to realize where you are behind first. For me, realizing my two greatest weaknesses has helped me tremendously.” Although he also admitted, “It’s very hard to find those weaknesses and discover your strengths, but when you do, everything seems to fall into place.” Conversely, some students realized they had falsely inflated senses of their writing abilities. However, their process of deflation signaled increased self-efficacy. Luis discovered, “I had thought I had a thesis in my earlier papers but learned that I didn’t. . . . I have started to practice more and am kind of starting to enjoy it because it’s not as hard as I thought it was.” Mario reflected, “I realize I can be arrogant in the respect that I can find flaws in others and am oblivious to my own mistakes, which I can see needs to stop.”

Accurately understanding one’s weaknesses meant it became possible to find solutions. Elizabeth recognized, “I found that writing and reading over multiple drafts helps me. It’s also hard for me to begin an essay, but lo and behold, there’s a solution to this problem: An outline can help me map out my ideas better.” Eduardo had a similar experience: “It was hard for me to try and come up with a solution for fixing this weakness [going off on tangents].” However, he realized the essence of the problem had to do with failing to communicate effectively to his readers, so “to make this weakness better I would ask some peers of mine to read the essay and ask if anything was confusing.” Thus, they each had created tool kits of strategies they could use to fix their specific writing problems.

**Personal agency: “I have turned weakness into strength.”** This sense of having resources at one’s disposal signaled a new sense of agency and empowerment. Alongside specific writing content (e.g., teaching what a thesis statement is), two specific pedagogical strategies seemed to have had the most impact. One was allowing students to generate their own essay topics or have essay topics emerge from class discussion. Again and again, this sort of comment emerged: “Writing about things that I like to write and in a style that I like really changes the game.” The new game was “more fun,” which translated into “caring what I put into it and actually putting an effort toward the supporting authors, evidence, and making a good thesis.” Kim concluded, “I don’t hate writing as much. When it is a topic I care about, I become very passionate.” Moreover, when she felt her own ideas were controlling the paper, she described less anxiety about things like length requirements.

The second most impactful pedagogical strategy was the power of positive feedback. As Valerie put it, “I have benefitted from having a teacher that doesn’t tell me everything that is wrong with my paper and instead tells me what is good about it [and] where I can improve.” Eduardo articulated its value as “helping me extremely because being confident while I write helps me have fun with my essay rather than worrying about if my writing sucks.” Or, as Tara said, “When you have better guidance, you get a better attitude; when you get a better attitude, an individual’s full potential can really come out.” Jennifer clarified a key distinction, “Sure getting an A on a paper is rewarding, but it’s not as meaningful as someone saying ‘I really enjoyed that paper; Good job!’” Seeing grades as less important signals a significant shift in motivation and self-regulation.

**Critical distance: “You can complicate, extend and disagree with an author’s idea.”** Along with engaging students in the writing process, this new sense of agency seemed to simultaneously provide students with some critical distance. They no longer felt like pawns being pushed around by prescribed length requirements, the rules of grammar, or the obligatory use of required readings. They felt they could own these things and turn them to their advantage. Nowhere was this more striking than in their attitudes about the course reading. Students came to see that reading carefully gave them something to say in their essays. Elizabeth observed, “In the beginning when I had to use authors [in my essays], I noticed that I did not analyze their ideas as far as I could. But I discovered . . . that you can complicate, extend, and disagree with an author’s idea.” This insight led her to “better draw out creative analysis.”

To be able to have these kinds of epiphanies, students not only saw themselves as writers, but they saw themselves in relationships with other writers. I mentioned previously the number of students who described positive experiences with peer review. Jennifer took this a step further and saw the authors of the course readings as models for her own writing: “We have read so many authors this semester, and analyzing their work and the style they write with has helped me figure out the type of author that I want to be.”

**Discussion**

Core category analysis (Glaser, 1992) revealed contrasting portraits of students at the start and end of the semester, demonstrating key features of their lived experience in the transition from pessimism and learned helplessness to optimism and increased writing self-efficacy. Many students started the semester with a lack of intrinsic motivation, judgment-induced anxiety, writing element conflation, and a lack of coping strategies. They ended with increased coping skills, personal agency, and critical distance.

**Core Categories: Pessimism and Learned Helplessness**

These four areas where students located the sources of their writing weaknesses—a lack of control and intrinsic motivation, fear of judgment, writing-element conflation, and poor coping strategies—proved to be both features of low self-efficacy and a breeding ground for some troubling emotions associated with writing. One might expect students who had had these sorts of experiences to express high levels of writing anxiety. This certainly was

-----

**Two specific pedagogical strategies seemed to have had the most impact.**
the case, resulting for some in a kind of obsessive over-concern. Maggie described, “I spent days and nights trying to perfect my final essay in even the smallest of ways.”

Alongside the anxiety were also high levels of demoralization. Kim, one of the students who exhibited the lowest levels of writing self-efficacy on the pretest, wrote:

I have never [emphasis added] been a very strong writer. English has always [emphasis added] been the one class that I hate [emphasis added] to go to every single day [emphasis added]. The only [emphasis added] strength I have as a writer is I get to the point. Which in many cases is not a strength [emphasis added] at all. If I don’t get stuck at the beginning, once I start I still don’t know what to write. Although most of the time I have an idea in my head, I am never [emphasis added] able to articulate it well on paper if at all. All throughout school I was always [emphasis added] too short for length requirements whether it was a paper or a speech. Neither of which I can execute [emphasis added].

Most distressing about this example is the fact that these 116 words represent her entire output for the allotted 50-minutes. The concern is not that she lacked having much to say so much as the specific details she was able to share. Cognitive psychologist Martin Seligman (2002) describes pessimists as those who believe that the results of negative events are permanent, that one experience of failure permeates all aspects of that experience, and that they themselves are to blame for failure. At the same time, pessimists exhibit a lack of agency to affect change. Using this lens, it is easy to see that Kim has developed a pessimistic view of herself as a writer. She used categorical terms (e.g., never, always), indicating her sense of permanence. Her negative writing experiences have also permeated to the extent that she hated going to English class every single day. She additionally undermines the one strength she thinks she might have and then blames herself for this state of affairs.

Seligman’s (2002) research has shown that pessimists are much more prone to giving up in the face of adversity, and pessimism can be linked to an even more severe state of learned helplessness in which people feel there is nothing they can do to control future outcomes. “Some students who fail continually on a task learn to be helpless at that task and to see failure as inevitable on similar tasks—in many cases giving up before they have even begun” (McLeod, 1987, p. 431). Therefore, as Kim’s case indicates, if an absence of student writing self-efficacy is actually a form of learned helplessness, then it may be particularly challenging to help such students become more effective writers because they are not just unmotivated but may be antimotivated, believing themselves completely incapable of change.

Other students exhibited similar features of pessimistic thinking and learned helplessness. Luis believed an essay could be categorically doomed from the start: “I believe that if I have a bad time with the topic, and my introduction doesn’t attract the readers, then it would continue with the rest of the paper.” He also attributed his failures to his own personal shortcomings, “I tend to be a lazy writer and just want to jump into the easy parts to get it over with.” Certainly, people can be lazy writers, but another way of framing his difficulties might be to suggest that he is not motivated to work through set-backs. Such a lack of motivation might be explained by the fact that many of the students equated their worth as writers with the grades they received on their essays. Mei-lee explained, “Speaking two languages, I write in a way that makes sense to me, but not in English. I didn’t know I was doing it wrong, until I received my first essay back with red marks all over it.” Thus, her agency became externalized.

In general, the language students used, or did not use, to describe themselves as writers at the beginning of the semester indicated an overwhelming sense of isolation. They perceived themselves as working alone in a hostile environment where the dreaded red pen lurks. This is not to say all students had given up. Some believed “I am trying and that’s all that matters.” And, “I will get there someday!” Harris asserted, “I consider my enthusiasm in my writing one of my key strengths. . . . I believe in my ideas.” The trick for writing instructors is to help all students develop this kind of enthusiasm and confidence.

Writing teachers should eschew enforcing rigid and arbitrary requirements.

My first essay back with red marks all over it.” Thus, her agency became externalized.

In general, the language students used, or did not use, to describe themselves as writers at the beginning of the semester indicated an overwhelming sense of isolation. They perceived themselves as working alone in a hostile environment where the dreaded red pen lurks. This is not to say all students had given up. Some believed “I am trying and that’s all that matters.” And, “I will get there someday!” Harris asserted, “I consider my enthusiasm in my writing one of my key strengths. . . . I believe in my ideas.” The trick for writing instructors is to help all students develop this kind of enthusiasm and confidence.

Core Categories: Optimism and Self-Efficacy

Although no students ended the semester reporting they had become master writers, what was striking was the number who came to recognize writing as a process, and this resulted in more patient, realistic, and hopeful goals. Jorge observed, “How do I feel about myself as a writer now? Well, I certainly feel more confident. I still feel as if I am not a great writer, but that takes time, and that is what I realized in [this] class.” This movement from achievement goals (i.e., getting the paper finished, getting a good grade) to process goals signals a shift from the helplessness of pessimism to the self-efficacy of optimism. According to Seligman (2002) optimists see adversity as fleeting, context-dependent, and manageable. Optimistic students are, thus, able to see themselves as capable of persevering through challenges and, by doing so, acquire writing self-efficacy (Pajares, 2001). I cannot begin to quote all of the student lines reflecting their insights into the writing process. Two stood out. Maggie summed up the whole idea: “My weaknesses are not so much things that devalue my writing, but they are more works in progress. They are fixable.” This translated into the realization that “I can just keep working on how I revise essays. My strengths and weaknesses do not define me as a writer; they just shape me into the student I am today.” Perhaps Tara was most poetic: “Now I feel like writing is taking a canoe ride down a lake, it may be a long ride, but at the end it’s breathtaking.”

In addition to seeing writing as a process, other students stopped seeing their struggles as unique and alienating. Harris realized, “There are still some areas where I can improve my writing. Not as bad as it sounds, these are places where not just me, but where a lot of people seem to struggle.” They expressed less anxiety, even if it was just “I don’t really dread writing anymore.” Many articulated increased self-efficacy as having discovered their “voices” as writers. Others commented on feeling “freer.” Some talked about “enjoyment,” “passion,” and “pride” in their writing.

Mediated-Efficacy Theory

The primary purpose of this study was to generate a theory about self-efficacy development. However, after examining the data, I concluded that the premise under which I began this analysis might have been flawed. The very notion of self-efficacy relies on a conceptualization of independence and individuality that contradicted what the students themselves reported. In their experience, they actually felt more independent, in one sense of the word, when they had less self-efficacy. Unfortunately, this independence was not characterized by autonomy so much as by excruciating isolation. Their subsequent gains in confidence and agency were associated with their sense of being embedded in a caring community with other writers and receptive readers. Essential to that sense of community was the writing instructor who allowed it into being.

Clearly, some of the ways such caring communities are built involve simply avoiding those practices associated with learned helplessness. Writing teachers should eschew enforcing rigid and arbitrary requirements, put away the red pen, and resist presenting writing as a kind of one-size-fits-all monolith for which only they have the master code. However, this study demonstrates that effective writing instruction is about more than avoiding bad practices. It entails actively developing a teaching environment that
sees the value in whatever students bring into the classroom. I have already discussed two pedagogical techniques that the students have identified as important: student-generated or nondirective essay topics and positive instructor feedback. In addition to those, other elements also have emerged as essential.

On a separate learning inventory given at the end of the semester, over 90% of students (n =131) reported “having the same group of students and having the same instructor for both my writing studio and discussion section” were somewhat or extremely important for their learning, indicating the significance of the relationships forged in the class. Eighty-three percent of students also described “frequently” encountering a positive classroom climate. That was the highest single-answer on the entire inventory. Therefore, of all of the deliberate measures the instructional team took to cultivate student writing self-efficacy, these four stand out—encouraging student-generated essay topics, providing positive feedback, scheduling the same instructor for seminar and studio, and optimizing a welcoming classroom climate. The studios provided much more than just 100-minutes of additional instruction time each week; instructors did not lecture or grade work during studio time but worked side-by-side with students as mentors. The studios thereby created a space where the students felt their teachers were on their side. Or, as Jennifer put it, “My teacher wanted me to succeed. She looked out for me and was available to help me.”

Therefore, rather than generate a new theory about self-efficacy development, this study indicates a need to reconceptualize the construct and explore how mediated-efficacy functions to motivate student writers. This is not to suggest that as students develop writing self-efficacy they do not also develop a more internalized locus of control, becoming more self-regulated and task-oriented (Pajares, 2003). But such emerging personal agency arises in tandem with forging stronger, not weaker, ties with other people. Self-efficacy theory identifies the importance of modeling and positive feedback but seems to suggest these are crutches that might be discarded once an individual achieves sufficient confidence to operate independently. In the context of this study, that premise is initially appealing, and one might posit that the developmental writing classroom must provide that kind of shelter. However, such a teleological view of writing self-efficacy is flawed.

Becoming a writer is inherently an emerging process (Newkirk, 2009). Self-efficacy depends on the nature of that emergence, which is colored by the relationship between writer and audience. Every writing task represents a new context in which efficacy must be newly forged to some extent. For students receiving grades on their writing, there is no more important audience member than the teacher. To help student writers find their agency, teachers must realize that role is neither an opportunity to wield the “red pen of death” nor a role they should pretend does not exist. A mediator is someone who intervenes to negotiate a reconciliation. The developmental writers in this study needed to reconcile negative self-beliefs developed in the past with newly-forged positive identities that could impact their future performance. Put another way, writing teachers have power over their students and must use that power to mediate a process whereby students dismantle learned helplessness, dispute pessimism, and develop optimism. Teachers must enter into the reciprocal relationship in which mediated-efficacy is formed.

To a certain extent this requires reconceptualizing not just how writing is taught in college but also how instructors view themselves as writing teachers. Notably, the success in the first-year seminar class came from instructors’ ability to balance conflicting role-demands effectively. Instructors broke down hierarchies between themselves and their students while at the same time drawing on
personal writing expertise and authentic passion for the subject. Acting simultaneously as reading coaches, fellow writers, and in-house consultants, ungraded studio work was polished into formal essays. The goal was to provide constructive, non-judgmental feedback while also knowing teachers ultimately had to evaluate the quality of that work. Getting that balance just right is the hallmark of a teacher whose students develop mediated-efficacy.

Limitations
The findings presented in this study may not be generalizable beyond the sample population at a single institution, and any claims regarding impact for particular groups of students (e.g., first-generation college students or Hispanic males) must be qualified by the fact that the “top gainers” sample used to derive mediated-efficacy theory was small. Connections between efficacy gains and student demographics also could be skewed due to confounding variables. For example, many of the Asian students in the sample attributed poor writing skills to weak English language mastery.

Implications: Mediated-Efficacy in the Disciplines and Areas for Future Research
For readers familiar with contrasting learning theories, this study might imply a Vygotskian victory. Vygotsky’s (1978) theory of sociocultural learning posited that “all the higher functions originate as actual relationships between individuals” (p. 57) and that it is within those relationships meaning is made. Bandura (1986) deliberately distanced himself from this model. He described learning as a sociocognitive process that relies on modeling and self-efficacy, emphasizing intellectual interpretation as the mechanism by which individuals construct reality. However, the learning that happened for the participants in this study appears to have occurred in both sociocognitive and sociocultural dimensions. Students followed social cues from their instructors, which in turn influenced how they thought about their learning potentials. In other words, mediated-efficacy theory has demonstrated features of both sociocultural and sociocognitive theories. Recent research in affective neuroscience might explain how this could be possible.

Hardcastle (2003) asserts that emotion is “the ‘core’ around which we structure ourselves and the world” (p. 43). Thus, emotion is fundamental to all learning, or, as she puts it, “we use our emotions cognitively” (p. 43). As students construct narratives about themselves as writers, their teachers can powerfully determine whether they are the heroes or the victims of their educational stories. Therefore, acknowledging the role of student affect in mediated-efficacy has implications both for teaching practice and for student learners.

In my work as pedagogy coordinator for the first-year seminar course and as director of the writing in the disciplines program, I often hear other professors lament that students do not know how to write. They believe that writing consists of a discrete set of skills that easily transfers from one course to the next; freshman composition should have taken care of imparting those skills. Scholars have well established that such a notion of transfer is a myth (Carroll, 2002; Newkirk, 2009). What has not been explored is the corollary myth that writing self-efficacy automatically transfers from one class to another. The instructional team has the sense that as students move out of carefully crafted seminar environments into the university at large, their fledgling self-efficacy is at the mercy of other professors, professors who might believe their role is to weed out unqualified students. However, a contrasting perspective argues that students “must be armed with optimism, self-regard, and regard for others, and they must be shielded from doubts about the authenticity of their accomplishments” (Pajares, 2001, p. 34). Teachers must activate this optimism. Powerful future research might investigate the impact of an even more deliberately designed “optimistic classroom” that teaches students how to refrain from categorical thinking and to reframe writing problems as manageable. Future research might continue to explore the potential relationship between learned helplessness and low self-efficacy. Additionally, given Bandura’s (1993) work linking teacher efficacy with student learning, program administrators need to understand how to help faculty develop the skills and efficacy to foster such a positive classroom climate.

However, given that one of the most striking findings from this study has to do with correlation between increased self-efficacy and student agency, perhaps the focus really needs to shift from the “powerful” instructor to the “empowered” student-learner. Such work has already begun in terms of exploring the potent impact metacognitive ability has on student learning (Brown, Roediger & McDaniel, 2014). This study suggests that acquiring meta-affective skills might be equally important. Students need to understand how they think in their classes, but understanding why they feel the way they do might be even more predictive of their success. Future research could look for connections between mediated-efficacy and student persistence to degree. Given that efficacy impacts motivation, such relationships seem likely. Further work might also explore the role of mediated-efficacy in disrupting other negative emotions (e.g., stereotype threat) that can be barriers for students from marginalized populations.

Conclusion
Student narratives from this study offer valuable insights into the personal dimensions that first-year college students in developmental-level courses experience and how those insights can translate into teaching practices that seem to facilitate self-efficacy development as well as into areas for further research. Moreover, they demonstrate that profound changes in writing self-efficacy can be detected after a single semester (Camfield, 2015). However, even professors who embrace teaching writing in upper division classes sometimes express anxiety because they feel they do not have the appropriate special knowledge of composition to teach writing effectively. This study reveals that what might be pedagogically more important is entering into a relationship with student writers that positions the instructor as a mediator between what it is the writers want to say and the academic audience with which they communicate. Specific writing skills become the tools of that mediation. Useful yes, but, not unlike the utility of knowing how to use a hammer, only truly valuable when used to build something. Mediated-efficacy requires a balance between helping students wield tools on their own and creating the environment in which they believe they have something worthwhile to construct. Developing mediated-efficacy holds promise to address positive growth in writing proficiency and student success.

References
Evidence of Efficacy: The student is able to identify elements of effective writing AND demonstrates belief in his/her ability to use these elements successfully. While the student identifies writing problems, he/she may offer possible solutions to these problems. The student is aware of writing as a process and is able to prioritize specific future tasks. The student may comment on effective (or new) management of time to effectively fulfill an assignment.

Evidence of Mastery Experiences: The student describes having had successful writing experiences at any level or point in the process (i.e., student does not have to have “mastered” all of writing to have had mastery experiences).

Evidence of Use of Positive Modeling: The student refers to course readings and/or other writing as aspirational models used when approaching her/his own work. The student might also talk about the utility of peer and/or instructor feedback. The student might refer to his/her own successful previous writing as models as well.

Evidence of Reduced Anxiety and/or Increased Positive Affect: The student uses positive or affirming adjectives to describe her/himself as a writer. Student may even express confidence and/or enjoyment of writing. Problems are accurately attributed but seen as specific and manageable (e.g., “I need to work on coming up with strong thesis statements.”), as opposed to global and catastrophic (e.g., “I am stupid.”).

Evidence of Empowerment or Positive Social Agency: The student takes responsibility for his/her own writing, as opposed to blaming other factors for poor outcomes. The student may express willingness to “keep trying” and attributes success to improved writing ability rather than luck or external forces. The student may express “ownership” of the writing topics (e.g., “I write to express my ideas.”), rather than just writing to please the teacher. The student may describe proactively seeking feedback from readers and/or actively utilizing available writing support systems.

Appendix
Scoring Rubric to Identify Students’ Writing Self-Efficacy

This semester, students wrote for 50 minutes during the first and last writing studios, describing their strengths and weaknesses as writers and providing some personal experiences to support their claims. In reviewing these ‘pre’ and ‘post’ writing diagnostics, please score each sample using the following scale.

<table>
