Abstract

Corporate entrepreneurship is a critical area of curricula for computer science and information systems students. Few institutions of computer science and information systems have entrepreneurship in the curricula however. This paper presents entrepreneurial health informatics as a course in a concentration of Technology Entrepreneurship at a leading institution of technology. In the concentration, and in the course, students are learning to be business entrepreneurs in interdisciplinary fields, such as health. This paper can be beneficial to educators in schools of computer science and information systems desiring to enrich offerings to be contemporary with the demands of industry.

Keywords: computer science, computing curricula, entrepreneurship, interdisciplinary, health, health informatics, information systems

1. BACKGROUND

Corporate entrepreneurship is an approach for applying creativity and innovation as a means to entrepreneurial opportunity (Ireland, Kuratko, & Morris, 2006) in a process or product in industry. Entrepreneurship is a discipline of initiative, innovation, opportunity recognition, and pursuit of reward and risk (Phillips, & Garman, 2006). The criticality of enabling entrepreneurship for creativity and innovation is cited in the business literature (Byers, Dorf, & Nelson, 2011). The enablement of entrepreneurship from creativity and innovation fosters entrepreneurial opportunity in industry.

The health industry can benefit from entrepreneurship coming to life from the current Affordable Care Act (ACA) of 2010 – Obama Care - legislation.

The health industry is considered costly (Ratten, 2012), impersonal, and inefficient in methods of operation (Cutler, 2010). The industry is $2.6 trillion or 17.9% of the gross domestic product (GNP) of the country (Norbeck, 2012). Entrepreneurial innovation in an electronic health medical or record system (EMR) can help in cost cutting in a hospital. The industry is additionally considered inefficient in patient-oriented service (De Regge, Gemmel, Degadt,
Verhaeghe, Sijnave, & Duyck, 2012) and performance of staff. Innovation in an intrapreneurial predictive personalized-prescription process and provider system can improve patient service. The industry is also considered in need of improved consumer-oriented systems (Ratten, 2012). Innovation in medical mobile systems (Milian, & MacMillan, 2012 and Briley, 2013) can improve non-patient and patient self-service (Howard, 2008). The health industry is clearly fertile for increased entrepreneurial opportunity (The Economist, 2013) and from increasingly required organizational response (Deluca, & Enmark, 2002) – a field that can be infused by schools of computer science and information systems.

Graduates of schools of computer science and information systems having entrepreneurial skills can be innovators in the health industry. As millennial students, they can be, for example, innovators in medical monitoring applications (apps) on smart-phones (Horowitz, 2012b) and Twitter; in integration of applications, patient record systems and reimbursement systems; in mining of patient record systems (Mathews, 2013) and of patterns and relationships in the systems (Srinivas, Rani, & Govrdhan, 2010); and in process re-engineering and research of health information exchanges (McNickle, 2013) and of service systems and tools (Ebling, & Kannry, 2012). They can be innovators in modeling intervention programs for issues, such as obesity and diabetes, or policies, such as HIV (Greengard, 2013). They can be further innovators in new DNA genetic profiling tools (Howard, 2008) and smart clothing tools (Velshi, 2013). They could explore favorable funding from investors in health industry incubators – a $1.1 billion field in 2012, a 70% increase from $626 million in 2011 (The Economist, 2012b). To be exploiters of health industry opportunity, computer science and information systems students have to learn not merely technology but also the business of the health industry and the economic potential of technology in an interdisciplinary Technology Entrepreneurship concentration. Few schools of computer science and information systems have a Technology Entrepreneurship concentration integrating a health informatics course opportunity for students, an opportunity addressed in this paper.

The Seidenberg School of Computer Science and Information Systems of Pace University began a concentration in Technology Entrepreneurship in its Bachelor of Arts in Computer Science (Lawler, & Joseph, 2010). The concentration is designed for students to learn the fundamentals to be business opportunists, not mere scientists or technologists. The emphasis of the concentration is in the development of cutting edge ideas for a process, product or service, infused by entrepreneurial innovation if not invention of systems and tools, in a fictitious firm, or if feasible in an actual firm. The emphasis of the concentration currently is in a course in Entrepreneurial Health Informatics in the disciplinary domain of the health industry, as conceptually depicted in Figure 1 of the Appendix, inasmuch as Obama Care is encouraging entrepreneurship in the industry (The Economist, 2012a). Encouraging for schools, Obama Care is expanding innovation in popular mobile tools (Everett, 2013) interesting to students.

The generic learning objectives of Entrepreneurial Health Informatics are defined below:

- Define a business competitive or cost effectiveness idea for a process, product or service for the health industry that can be infused by innovation or invention of new systems or tools;
- Design and develop a process, product or service, or prototype, for the health industry that can furnish opportunity for productivity if not profitability from integration of new solution systems or tools;
- Design and develop a business and financial plan for the process, product or service for the industry – hospital or physician practices, provider systems, or mobile non-patient or patient self-service tools - infused by the potential of productivity if not profitability of the new systems or tools;
- Design and develop a customized plan for marketing the process, product or service for the industry, infused by the new solution systems or tools, to marketplace providers and society; and
- Integrate contemporary innovation in the marketplace, such as cloud methodology, data mining and data warehousing technology, which might improve the solution systems or tools of the new venture.

The course is consistent in design with other interdisciplinary domains in the concentration of Technology Entrepreneurship in the school, as depicted in Figure 2, and is 4 credits. The outcomes are in adaptability, analysis, business, collaboration and communication - aspects of an entrepreneurial mind in creative critical thinking, problem-solving and risk-taking – in an expanding field (Brill, 2013). The outcomes are for students to be not mere technologists but business opportunists of technology. These outcomes conform to demands of consumers (Everett, 2013) and of the health industry for persistent and self-motivated students skilled in solution technology (Malugani, 2012). Entrepreneurial Health Informatics, in the concentration curriculum of Technology Entrepreneurship, can be beneficial to Bachelor of Arts in Computer Science students in the Seidenberg School, in the crafting of an experience that can improve hiring prospects (Khan, 2013) in health if not other industries.

3. FOCUS OF PAPER

The course in Entrepreneurial Health Informatics, in the concentration of Technology Entrepreneurship in the Bachelor of Arts in Computer Science program in the Seidenberg School of Computer Science and Information Systems of Pace University, is the focus of the paper. The domain of the health industry, as an entrepreneurial field of interdisciplinary study, is current to the expectations of government, industry and society for computer science and information systems students. The entrepreneurship in the health industry is not as formed as in other industries (Phillips, & Garman, 2006), nor as fulfilled in information technology (Kellermann, & Jones, 2013), furnishing innovation opportunity for students. The paper is not focused on the other courses in the concentration of Technology Entrepreneurship, as depicted in Figure 2, of which the course of Entrepreneurship and Technology was covered in an earlier study (Lawler, & Joseph, 2010). This paper will be beneficial to instructors in schools of computer science and information systems desiring to improve offerings to be current with industrial and societal trends.

4. CONCENTRATION METHODOLOGY - TECHNOLOGY ENTREPRENEURSHIP

The concentration in Technology Entrepreneurship began officially in 2011, from basic courses in the Bachelor of Arts in Computer Science ebbing into courses in entrepreneurship, in a desired sequence:

- Entrepreneurship and Technology, a concept course currently integrating computer science and entrepreneurship on a project for business competitive decision-making;
- Customer Relationship Management (CRM) and Entrepreneurship, a concept course currently integrating data mining and data warehousing on a project for decision-making in strategy;
- Entrepreneurship and Financial Computing, a domain course currently integrating algorithmic computing, entrepreneurship, finance, financial analysis and information systems on a project for financial decision-making and strategy;
- Cloud Sourcing, a domain-enabling course currently integrating cloud methodologies and platforms on a project for financial decision-making and strategy;
- Modeling of Financial Processes, Products and Services through Technology, a domain-enabling course currently integrating cloud platforms, finance and information systems on a project for financial decision-making, on reengineering of systems through prototyped or real software technologies;
- Entrepreneurial Health Informatics, a domain course of the paper;
- Energy Efficiency Entrepreneurship, a domain course in the future, integrating entrepreneurship on a project for decision-making in the energy industry;
- Entrepreneurship and Governmental Security, a domain course in the future,
integrating governmental and industry policy on a project for crisis decision-making in national security strategy; and

- Special Topics in 21st Century Technologies and Ventures, an optional survey course further integrating leading edge marketplace technologies impacting new ventures.

The concentration of the courses of Technology Entrepreneurship covers a 2011-2015 period in the school.

The methodology of Technology Entrepreneurship, with Entrepreneurial Health Informatics, is depicted in Figure 2.

Those majoring in computer science or information systems may be fast tracked through the concentration of Technology Entrepreneurship, so that they may finish the courses, especially Entrepreneurial Health Informatics or Entrepreneurship and Financial Computing, sooner than other undergraduate students in the Seidenberg School; and so that they may be more marketable to domain internship prospects at industry ventures. Otherwise, the concept courses of Entrepreneurship and Technology and Customer Relationship Management (CRM) and Entrepreneurship are the prerequisites, as depicted in Figure 2.

5. COURSE MODEL – ENTREPRENEURIAL HEALTH INFORMATICS

The course in Entrepreneurial Health Informatics, in Technology Entrepreneurship, began in 2012, engaging students in diverse or dueling entrepreneurship innovation in a process, product or service - mobile monitoring applications to process re-engineering of systems in the health industry. They are focused on identifying opportunities from problems learned from industry research and on iterating prototyped simulations or solutions for minimal ventures, and may be iterating solutions even in failure, an integral part of problem-solving and risk-taking. The projects for formulating individualized new solutions and subsequent ventures are initiated in small (3-5) student teams, which are mentored by alumni executives from the health industry in New York City. The executives may have furnished the problems to the teams. The students are also mentored by the instructor. The student teams may shadow a number of the executives in health industry start-up ventures, which may be pursuing solutions similar to the teams. These teams may moreover, in a mission of municipal service, share solutions of systems or tools with non-profit organizations in the industry. The instructor interacts with the student teams through the Blackboard Academic e-Education Suite – Discussion Boards and through the classroom – 4 hours in the classroom labs a week in a semester of 14 weeks.

At the end of the 14th week, the teams present the projects of systems and tools and the proposals of ventures to the instructor, investors invited by the mentors and regional representatives of the health industry; and they reflect on the results of the semester.

The specific learning of Entrepreneurial Health Informatics is depicted in the syllabus in Table 1 of the Appendix.

6. IMPLICATIONS

The course in Entrepreneurial Health Informatics is enabling a firmer foundation for the concentration of Technology Entrepreneurship of the Seidenberg School. The course is enabling entrepreneurial and interdisciplinary learning in an industry in which the highest investment in health technology is in this country (Norbeck, 2012) - an industry formulating as proactive in innovation investment in the technology (Horowitz, 2012a). The course is also enhanced by inclusion in Technology Entrepreneurship. Entrepreneurial Health Informatics is furnishing a product that is reacting to the requirements of the industry (Wagner, 2012). Other schools are frequently furnishing students that are not reacting to the skills of the industry. The implication of the paper is that Entrepreneurial Health Informatics is a marketable product to students desiring an interdisciplinary Technology Entrepreneurship program.

Entrepreneurial Health Informatics is enabling an exciting initiative of students to be innovators in
health industry technology. Evaluating opportunities and problems, and furnishing prototypes and solutions (Hyman, 2013), is ideal learning – not passive but proactive problem-solving. Partnering with a health organization and a technology organization on patient problems is an ideal project (Analytics, 2013). In the period from 2011, the bulk of the 36 students in Technology Entrepreneurship (12 in Entrepreneurial Health Informatics) are notably positive on the marketplace potential of even modest projects and on the overall progress in the semesters (Joseph, & Lawler, 2013). They are especially notably positive on mentor relationships (Joseph, & Lawler, 2013) with small start-up ventures (Cortese, 2013), through Entrepreneurs’ Organizations and Startup America Partnership (Max, 2013), and on the potential of recruitment with these ventures, which in the literature is noted as a product of Technology Entrepreneurship programs (Austen, 2013). The implication of the paper is that Entrepreneurial Health Informatics is an appealing proposition to students eager to pursue interdisciplinary potentials of technology.

Lastly, Entrepreneurial Health Informatics is facilitating growth into the Bachelor of Arts in Computer Science program of the school. The future of the health industry (McKenna, 2013) is evident to intelligent undergraduate students in the country intending to leverage the opportunities (Tribune Media Services, 2012) and the promises (Horowitz, 2013) of health technology. Schools of computer science and information systems may integrate the cloud methodologies and platforms of Bachelor of Arts in Computer Science programs (Lawler, & Joseph, 2011) into entrepreneurship and innovation projects, as on the projects of Entrepreneurial Health Informatics of the Seidenberg School. As a result, they may inexpensively invest in more entrepreneurship and innovation projects with cloud technology (Sobel, 2012, and Pratt, 2013). The implication of this paper is that Entrepreneurial Health Informatics, as an example of Technology Entrepreneurship, is a definite proposition to instructors of any university intending to be in tandem with industrial trends.

8. CONCLUSION

The paper presents a course in Entrepreneurial Health Informatics in the concentration of Technology Entrepreneurship at Pace University. The course is one of entrepreneurship innovation projects, from which students of the Seidenberg School of Computer Science and Information Systems of the university are positioned to be business opportunists, not pure technologists. The course provides the creative thinking, problem-solving and risk-taking of business professionals required by not only the health industry but by other industries. The concentration in Technology Entrepreneurship, and the course in Entrepreneurial Health Informatics, further provides interdisciplinary skills to undergraduate students that may not have nor otherwise would have had such skills. Overall, this paper provides schools of computer science and information systems with a proposition that is timely to industrial and societal trends.

9. ACKNOWLEDGEMENTS

The authors of this paper acknowledge funding from the National Science Foundation (NSF) in 2010 – 2013 for the Technology Entrepreneurship program in the Seidenberg School of Computer Science and Information Systems of Pace University in New York City.
