Abstract

The aim of this study is to examine the views of students about the achievements and motivations of the distance education processes in universities during the pandemic period. The working group consists of 68 prospective teachers who continue their undergraduate programs in different departments of a private university in Northern Cyprus in the 2019-2020 spring academic year. All these participants are studying at the various departments of the Faculty of Education as 17 are in Pre-school Education, 28 in Primary Education Mathematics, 6 in Primary Education, 1 in History Teaching, 12 in Special Needs Education, 4 of them are studying in Guidance and Psychological Counseling. The study is a qualitative study and the design of the study is determined as a case study. 42 female and 26 male teacher candidates participated in the study group. The majority of the participants are prospective teachers studying in their final year at university. While choosing the participants, easily accessible case sampling from purposeful sampling type was used. A Semi-structured interview form was used as a tool for data collection. Later, the opinions of the experts were obtained and the interview questions were re-arranged accordingly and applied to the participants. As a result of the research, it was concluded that the psychological trauma experienced by teacher candidates during distance education at the pandemic period affects both the success and motivation of their lessons.

Keywords: Pandemic period, University, Distance Education, Success, Motivation.

Introduction

With the beginning of the millennium, we entered the process of transition to the information society. The use of developing and changing information technologies has been assumed by authors such as Naisbitt and Toffler related to research in different ways. At the very beginning of 2020, we encountered the pandemic period with the threat of a virus allegedly originated in Wuhan, China. The epidemic of this virus quickly spread around the world. With the transition to the pandemic period, it affected the subjective and social lives of people and different measures were taken. At the beginning of these measures, actions taken by states or local administrations such as flight bans, quarantine, martial law, and regulations for the protection of social distance were increased. To slow down the pandemic, people living in certain masses stay in the house temporarily, to limit the movement as much as possible, it has become more dominant than the approach to increase the community's immune system and has been adopted as a common practice in all countries (Telli and Altun, 2020). The virus began to be seen in Turkey and in the Turks of the Republic of Northern Cyprus.
on March 11, 2020. Immediate measurements were taken covering several sectors by relevant institutions of the state as soon as the first case was detected in Turkey. In this context, the Higher Education Board (YOK) in Turkey to slow down the spread of the virus, to prevent the victimization of education, on March 26, 2020 announced that no classes would be done face-to-face in the higher education at spring semester during 2019-2020 academic year. So it came to distance education agenda in Turkey (YOK, 2020b). Distance education has become a compulsory application, which must be implemented quickly regardless of the infrastructure, in order to manage the process effectively and to prevent the suffering of students such as not being able to graduate and losing semesters. With this application, it quickly took place in all education levels on the preliminary prediction of the deficit and negative impact experienced at all education levels. (Brooks et al., 2020; Owusu-Fordjour, Sahu, 2020). Thus, as the COVID 19 pandemic period has been experienced, we have switched to a compulsory infrastructure in the distance education system by electronizing public administrations, universities and schools, and digitalizing their administrative processes (Sarıtaş and Barutçu, 2020).

Considering the studies dealing with distance education, the results of the studies conducted in Akdemir (2011) showed that distance education is preferred in our Higher Education, while achieving, only the number of programs and students in the 2014-2015 and 2015-2016 academic years could be reached at the master's level. As Yildiz and Cakmak (2021) notes that banks, ministries, universities prefer distance education in personnel training. Banks provide interactive trainings and exams to their employees through distance education systems. Ministries provide in-service training to their personnel through distance education. (Yildiz & Cakmak, 2021) For Berigel, (2017) skills and experience of staff determines growth speed of distance education and quality of distance education. In their research on the other hand Tuncer and Bağdır (2017), the students criticized distance learning as it may be suitable for some courses, as they may be suitable for some courses, and evaluated the instructors working in distance education as irrelevant and sincere. In a similar finding, Tuncer and Tanış (2011) stated in their study that distance education is not suitable for science fields, rather pessimistic mood in terms of learning environment, failures due to attendance and limited interaction, and individual approaches will decrease the efficiency expected from learning activities.

For this purpose, descriptive content analysis will be carried out in the qualitative research method to evaluate the opinions of the University Students on how the distance education process affects their success and motivation. For this purpose, answers to the following questions were sought:
1. How do the students studying the pandemic period evaluate at the university?
2. How are the levels of achievements of university students' success in distance learning related to distance education affected during the pandemic period?
3. How does the workload given to the students by the faculty member about distance education affect their motivation during the pandemic period?

Method

Research model

The model of the study is qualitative and the pattern is the case study. The reason for choosing this pattern is that during the pandemic period, the opinions of the students about the achievements and motivations of the distance education process in the universities were affected and the desires to be analyzed and analyzed. The case study is an approach that allows us to focus on a particular situation in depth.

The holistic single state pattern exists in three cases: First, if there is a well-formulated theory in the middle, this pattern has been used to confirm or refute it. If the latter does not comply with the general standards, a holistic single state pattern can be used in an overly contradictory and unique case study. Finally, a holistic single state pattern can be used where no one has ever worked or reached (Yıldırım & Şimşek, 2013).
Working group

The study group consists of 68 students studying in different departments of the Near East University in the Turkish Republic of Northern Cyprus and Atatürk Faculty of Education during the COVID19 pandemic period in the 2019-2020 spring academic year. Of the students, 17 are in Pre-school Education, 28 in Primary Education mathematics, 6 in Primary Classroom teacher Education, 1 in History teaching, 14 in Special Needs Education, 4 students studying in the Department of Guidance and Psychological Counseling. The study is a qualitative study and the design of the study is determined as a case study. 42 female and 26 male students participated in the study group. The majority of the participants are prospective teachers studying in the last year’s graduate program. Purposeful sampling was used when determining the participants.

Data Collection Tool, Data Collection, and Analysis

Interview form was preferred as the data collection tool since the main data collection tool was the interview in case studies. A semi-structured interview form developed by the researcher was used in the data collection phase. In a structured interview, questions are determined in advance, and data is tried to be collected with these questions (Karasar, 1998). The questions have been prepared in a way that can clearly reveal the opinions and motivations of university students about distant education during the COVID19 pandemic period. The statements in the interview form consist of 8 questions prepared for university students studying at the university for their success and motivation in the distance education process. Due to the situation, due to the curfew we were in during the pandemic period, questions were prepared in the Google Form, and Google drive prevented the loss of data by writing down the qualitative data obtained by the uploaded responses and was also limited to its analysis by descriptive and content analysis method. The data summarized and interpreted in descriptive analysis require a more in-depth analysis than content analysis and reaching concepts and themes that explain this data (Yıldırım & Şimşek, 2013).

At the end of this study, the validity of the question items was determined. It was concluded that the interview questions provided the desired data and the data collection process was initiated.

Result

The themes obtained from the opinions of the things can be tabulated and interpreted together with the frequency distributions. In the study, it was designed to plan success achievements and motivations in operations in distance education at universities during the Pandemic period. The findings obtained from the opinions of those studying at this intended University will be read in Table 1.

Table 1. Opinions about the pandemic period

Propósitos y Representaciones
May, 2021, Vol. 9, SPE(3), e1165
http://dx.doi.org/10.20511/pyr2021.v9nSPE3.1165
When Table 1 is analyzed, while 29% of university students participating in the study are bad terms, 1% made opinions about the unconsciousness of the public.

Below are the details of the opinions of university students involved in the study about the pandemic period:

- **STD1**: «A New Philosophy»
- **STD2**: «It is a very bad situation»
- **STD32**: «In this period, we were psychologically damaged because our health was in danger.»

**Table 2. Success levels of university students in terms of learning about distance education during the pandemic period**

When Table 2 is analyzed, 38% of the achievement levels of the university students participating in the study in terms of distance learning in terms of learning are stated as "Bad", while 1% made opinions about No Idea.

Below are the details of the opinions of university students involved in the study regarding their levels of success in terms of distance education:

- **STD26**: «We are overwhelmed personally, distance learning assignment, quiz, project. I don't want to see it, I think it's not good. It is ridiculous to have a lot of things done and waste our time or even days for 10 points.»
- **STD28**: "I am very successful, I have good grades but I have homework that is not explained”
- **STD37**: “I fulfill my responsibilities as long as my possibilities permit, I try to utilize at the maximum level, but I do not think that we can achieve the efficiency we get at school, even though we try hard.”
- **STD38**: “It provides a very productive education, it enables us to reinforce the subjects with the way the lesson runs and the homework it gives.”

Table 3. When analyzed, 35% of university students participating in the study stated that “My motivation is falling” while 6% of them stated that their motivation is very good.
Below are the details of the opinions of university students involved in the study about their motivations regarding distance education:

**STD2.** «Very intense homework is being given, I am psychologically disturbed»

**STD7.** “Yes, it lowers our motivation because every teacher almost I took the video, I told him, he goes in the style of the students.

**STD12.** «In this difficult process, when we have homework on top of each other, we sometimes have difficulties to do it. Unfortunately, our bad mood is getting worse when we say homework was a test, unfortunately. »

**STD18:** I do not understand why some of our teachers give more homework than they need, do the quiz, do the exam, I think they need to think more about student motivation.

**STD30:** “No, it certainly does not affect me, I think it adds a lot to me”

**Conclusion, Discussion, And Suggestion**

In this study, it was concluded that the psychological trauma experienced by university students during distance education during pandemic affects both the success and motivation of their lessons.

Opinions regarding the evaluation of the sub-problem questions of the opinions of the students about how the distance education process affects their success and motivation;

Most of the students related to the pandemic period were found to be based on the conclusion that they were badly and spiritually worn out. Similar to this study, in their study, Çetin and Özlem (2020) have made a difference both on loneliness and psychological resilience in the study of students living with their families or the close environment due to Covid-19, their thoughts about their future, meeting their basic needs in the future. In his research Erarslan (2014), found that positive self-perception and positive future perception have a partial mediating role between psychological resilience and life satisfaction.

In the second sub-dimension of the study, they expressed their opinions about the poor achievement levels of university students in terms of learning about distance education in the period of Pandemic. In the study conducted by Kör et al. (2013), it was concluded that using interactive materials such as animation, video, and simulation in distance education lessons will make students more efficient with the subject being remarkable.

According to the third sub-dimension of the study, they expressed that the motivation related to distance education decreased in the pandemic period in the majority of students at the university. When Sarıtaş and Barutçu (2020) examined the sub-dimensions of students' online teaching readiness in their study, it was seen that Horzum and Çakır (2015) had the lowest average of online learning control in their study.

Based on the results obtained from this study, the following suggestions can be made;

As we are in the pandemic period, students' opinions were received within the scope of the lectures given by a single lecturer at a single university. However, the opinions of students who take courses from different faculty members studying at different universities can be taken, associated, and compared.

Opinions of university students regarding distance education can be obtained by taking into consideration the study settlements.

The efficiency of distance education activities, the degree of student satisfaction and the difficulties experienced by learners should be explored.

It is recommended that universities' remote infrastructure systems are constantly updated for theory courses during the pandemic process and that equal opportunities are created for students with fewer opportunities.

It can increase the efficiency of the courses by providing in-service training about the distance education system to faculty members.
Quantitative research and relational screening research can be done to reach large kits. Success and motivation can be increased by providing students with information training on distance education.
