The movement toward inclusion has impacted classrooms by requiring teachers to respond to a broader range of academic needs. How can we possibly reach all the students in our classrooms when they are academically diverse, have special needs, are ESL learners, or have some combination of any or all of these factors? An answer to this question lies in differentiating instruction. Working in the Burris Laboratory School, an inclusion school using a resource consultation model to serve the needs of all its students, we have found that using tiered lessons is a viable method for differentiating instruction.

by Rebecca L. Pierce and Cheryl M. Adams
What is Differentiation?

Although differentiated instruction is not a new idea, the differentiation movement has recently taken center stage as a means of meeting the needs of all students in the classroom. It is an organized, yet flexible way of proactively adjusting teaching and learning to meet students where they are and help all students achieve maximum growth as learners (Tomlinson, 1999). Instruction may be differentiated in content/input, process/sense-making, or product/output according to the students’ readiness, interest, or learning style. By *content*, we mean the material that is being presented. *Process* activities help students practice or make sense out of the content, while *product* refers to the outcome of the lesson or unit, such as a test, project, or paper. *Readiness* refers to prior knowledge and a student’s current skill and proficiency with the material presented in the lesson. A student’s interest may be assessed with an interest inventory for the particular topic being studied or by an individual conversation with the student. Many teachers use the theory of multiple intelligences to characterize learning styles (Armstrong, 1994; Gardner, 1993; Martin, 1996).

Essential elements for successful differentiation include specific classroom management techniques addressing the special needs of a differentiated classroom, planned use of anchoring activities, and flexible use of time, space, and student groups. In a differentiated classroom, the management plan must include rules for working in a variety of configurations. You can only work with one group or individual at a time. Therefore, we have developed two critical rules that thwart chaos and preserve sanity. The first is “Use six-inch voices,” meaning that students should modulate their speaking level so that their voices can only be heard six inches away. The second rule is “Ask three before me.” If students need assistance completing a task or come to a stumbling block in a lesson and you are not available, they should find three other students to ask before they may interrupt you. If their three peers cannot answer the question, the student has permission to interrupt you. Adding the caveat that the student should also bring along the three students who were asked will nearly eliminate the chance that you will be interrupted except in extreme cases. Anchoring or “sponge” activities are provided for students to use when they are waiting for you to assist them before they can go any further or at the beginning of the class period to get them ready to work. A wide variety of materials and resources can serve as anchoring activities (see our Web site at http://www.bsu.edu/teachers/services/ctr/javits/Instruction/anchoring.htm for a listing of books that have great activities for anchoring). Flexible grouping arrangements such as pairs, triads, or quads, as well as whole-group and small-group instruction, create opportunities to meet individual needs. A flexible use of time allows lessons to proceed to their natural conclusion, rather than being carried out in set blocks of time. The desks or tables...
Tiered Lessons

Think of a wedding cake with tiers of varying sizes. Many examples of lessons tiered in readiness have three tiers: below grade level, at grade level, and above grade level. There is no rule that states there may only be three tiers, however. The number of tiers we use will depend on the range of ability levels in your own classroom since you are forming tiers based on your assessment of your students’ abilities to handle the material particular to this lesson. Students are regrouped the next time you use tiering as a strategy. Hence, the idea of flexible, rather than static, groups is essential.

No matter how you choose to differentiate the lesson—readiness, interest, or learning profile—the number of groups per tier will vary, as will the number of students per tier. You are not looking to form groups of equal size. When you form groups based on the readiness needs of individual students, Tier I may have two groups of three students, Tier II five groups of four students, and Tier III may have one group of two students. When the lesson is tiered by interest or learning profile, the same guidelines apply for forming groups: Different tiers may have varying numbers of students. Even when students are already homogeneously grouped in classes by ability, there is still variance in their ability levels that must be addressed.

To take a closer look at the anatomy of a tiered lesson, we have included a

First-grade teacher Martha Kendrick reads from Eating Fractions to Tier II students

should be arranged in such a way as to facilitate group work, as well as whole-class groupings that encourage sharing of ideas.

A variety of instructional strategies, including compacting, learning contracts, cubing, and tiered lessons, can be used to differentiate instruction (for a discussion of these and other strategies, see Gregory & Chapman, 2002; Heacox, 2002; Smutney, Walker, & Meckstroth, 1997; Tomlinson, 1999; Winebrenner, 1992). It makes sense to alert your administration and the parents that you will be trying some new strategies in the classroom in case there are questions.

The tenets of differentiated instruction support both the Equity Principle and the Teaching Principle of the Principles and Standards for School Mathematics (National Council of Teachers of Mathematics, 2000). These principles direct us to select and adapt content and curricula to meet the interests, abilities, and learning styles of our students; to recognize our students’ diversity; and to encourage them to reach their full potential in mathematics.

What is a Tiered Lesson?

Tomlinson (1999) described tiered lessons as “the meat and potatoes of differentiated instruction.” A tiered lesson is a differentiation strategy that addresses a particular standard, key concept, and generalization, but allows several pathways for students to arrive at an understanding of these components based on their interests, readiness, or learning profiles. A lesson tiered by readiness level implies that the teacher has a good understanding of the students’ ability levels with respect to the lesson and has designed the tiers to meet those needs.
Subject: Mathematics
Grade: First
Standard: Numbers and Operations
Key Concept: Students understand and represent commonly used fractions such as 1/4 and 1/2.
Generalization: Students will be able to illustrate how fractions represent part of a whole.
Background: Fractions (halves/thirds) have been introduced and illustrated by the students with pictures. Materials: Paper circles, squares, rectangles, triangles
Tier I: Using paper circles (pizza) and squares (sandwich), students in pairs determine how to share the food equally and illustrate by folding the paper. Have two pairs determine how they can share equally with four people. They can cut the parts and stack them to see if they match. Have the quad repeat the process for sharing a Reese’s Peanut Butter Cup equally with three people.
Tier II: Using paper circles (pizza) and squares (sandwich), have students in triads determine how to share the food equally and illustrate by folding the paper. Have two triads determine how they can share equally with six people. Have the group of six repeat the process for sharing a birthday cake with 12 people. In each case, they can cut the parts and stack to match. Have the group start with half a cake and divide equally for 3, 6, and 12 people.
Tier III: Using paper rectangles (sandwiches) and triangles (slices of pie), have students in pairs determine how to share the food in three different ways to get two equal parts. Have them illustrate by folding the paper. Are there other different ways to divide each shape equally? How many ways are there? Have the pair determine which shapes—circles, squares, rectangles, triangles—are easier to divide evenly and illustrate why with a particular food of their choice.
Assessment: As the students work, the teacher will circulate among the groups and note the children’s abilities to divide materials into equal parts and to recognize and check for equal parts. Can children explain orally how many equal parts there are and demonstrate how they know the parts are equal? It is at the teacher’s discretion to determine which children need more in-depth questioning to ascertain mastery of the concept.

Figure 1
Tiered Lesson in Mathematics: Tiered in Content According to Readiness

mathematics lesson (see Figure 1) that was developed as part of the Javits Grant, Project GATE, a federally funded partnership between the Indianapolis Public Schools and Ball State University, both in Indiana. When developing a tiered lesson, we have found the eight steps described below useful.

1. First, identify the grade level and subject for which you will write the lesson. In this case, the grade level is first and the subject is mathematics.

2. Second, identify the standard (national, state, district, etc.) you are targeting. A common mistake for those just beginning to tier is to develop three great activities and then try to force-fit them into a tiered lesson. Start with the standard first. If you don’t know where you are going, how will you know if you get there? The author of this lesson has selected the Content Standard “Number and Operations” of the National...
Tier III students work on folding their fraction pieces in thirds.

5. Fifth, determine in which part of the lesson (content, process, product) you will tier. You may choose to tier the content (what you want the students to learn), the process (the way students make sense out of the content), or the product (the outcome at the end of a lesson, lesson set, or unit—often a project). When beginning to tier, we suggest that you only tier one of these three. Once you are comfortable with tiering, you might try to tier more than one part in the same lesson. This lesson is tiered in content.

6. Sixth, determine the type of tiering you will do: readiness, interest, or learning profile. Readiness is based on the ability levels of the students. Giving a pretest is a good way to assess readiness. Students’ interest in a topic is generally gauged through an interest survey, while the learning profile may be determined through various learning style inventories. In this lesson, the author chose readiness.

7. Seventh, based on your choices above, determine how many tiers you will need and develop the lesson. When tiering according to readiness, you may have three tiers: below grade level, at grade level, and above grade level. If you choose to tier in interest or learning pro-
file, you may control the number of tiers by limiting choices or using only a few different learning styles. For example, tiering on all eight of Gardner’s multiple intelligences in one lesson may not be a good place to start, so choose only a few, such as logical-mathematical intelligence, spatial intelligence, and linguistic intelligence. (For further information on multiple intelligences in an easy-to-understand format, see Wahl, 1997). For this lesson, students are placed in one of three tiers based on their ability to work with halves and thirds as assessed by the teacher through observation.

Differentiation means doing something different—qualitatively different. Make sure you keep this in mind when tiering the lessons. Second, be sure that students are doing challenging, respectful, and developmentally appropriate work within each tier. In other words, no group should be given “busywork.” We don’t want one group doing black-line practice sheets and another doing a fabulous experiment.

Notice in this lesson that all three tiers are working on fractions. Students in each tier use paper shapes to divide. However, the activities for each tier in the sample lesson, beginning in Tier I and moving through Tier III, differ from concrete to abstract and from simple to complex, to use Tomlinson’s Equalizer word pairs (Tomlinson, 1999).

8. Finally, develop the assessment component to the lesson. The assessment can be formative, summative, or a combination of both. You may use some means of recording observations of the various groups, such as flip cards or sticky notes. You could develop a rubric for each tier based on the particular product that is created. You may give a formal paper-and-pencil test. Whatever it is, choose your assessment based on your needs and your lesson design.

In this lesson, the teacher observes the students as they share their answers and jots down notes for a formative assessment of each student. For example, which child is struggling with the concept? Which child is moving rapidly and accurately through the material? Whose answers show more thought and insight? Answers to these and other questions will assist you in determining who needs reteaching and who is ready to go beyond the material presented. A formal assessment is not used here since the standards emphasize that students should have “informal experiences [with fractions] at this age to help develop a foundation for deeper learning in the higher grades” (NCTM, 2000, p. 83).

When this lesson was taught, the students were engaged during the entire lesson. The lesson was introduced by reading the book Eating Fractions (McMillan, 1991). Students were placed in groups based on their level of readiness to interact with the content. Four students did not have a clear understanding of halves and fourths. These students needed a more concrete activity and were placed in Tier I. Another 12 students could recognize halves and thirds and were ready to complete the Tier II activity. They were placed in four triads. Two students had in-depth knowledge of halves and thirds and were placed in Tier III. This pair worked at a more abstract level, and the questions they were asked required them to use different critical thinking skills than the other two groups. Tier I and Tier II students were provided with activities from the book Fractions (Watt, 2001) to use as
Tier II students determine how to share a “pizza” and a “sandwich” equally with three people.

Tiered Lessons

Tier II students determine how to share a “pizza” and a “sandwich” equally with three people.

References

Subject: Mathematics  
Grade: Third  
Standard: #5 Geometry and #6 Spatial Sense  
Key Concept: Students work with geometric shapes and develop spatial sense.  
Generalization: Students identify lines of symmetry of objects.  
Background: This would be the fourth or fifth lesson in a unit on geometry where the first few lessons have covered various geometric shapes, as well as slides, flips, turns, congruence, and symmetry.  

Tier I:  
*Kinesthetic Learners*  
Pairs of students use brightly colored paper to make several simple origami designs. Provide guidance when necessary. When students are finished, have them unfold the figure(s), find any congruent figures, and identify lines of symmetry. Students then share the origami figures and have classmates try to construct them.

Tier II:  
*Visual Learners*  
Pairs of students work with pictures of items from nature, such as a butterfly, sunflower, rainbow, snowflake, or starfish. Students find any congruent figures and identify lines of symmetry for each item. Students color the pictures to help show the lines of symmetry. Students cut out the figures and have classmates find the lines of symmetry.

Assessment: Use a summative assessment noting students’ abilities to identify the congruent figures and lines of symmetry. Have each student reflect in writing about congruent figures and lines of symmetry. From a list of objects in the classroom, students will select an object and write about whether or not the object has congruent parts, lines of symmetry, or both and then explain why. The students could also include a drawing that illustrates the congruent parts, lines of symmetry, or both.

**Gifted Child Today Guidelines for Authors**

*Gifted Child Today* is a quarterly publication for parents, teachers, and other professionals who are interested in gifted education. Manuscripts may address all areas of gifted education that pertain to practices, policy, or applications of research.

*Gifted Child Today* is a peer-reviewed publication. The editor refers manuscripts to qualified reviewers who have expertise in a specific area. The editor provides the reviewers’ comments to the author. To avoid delay in the publication process, the author should follow these instructions:

1. Manuscripts should represent only original work that has not been published previously or is not being considered for publication elsewhere. If copyrighted material is used, copies of letters granting permission for publication should be included.
2. Manuscripts should be 8–30 pages in length, double-spaced.
4. Send four copies of the original manuscript. They should be typed, double-spaced on one side of the page only. Each page should be labeled with the page number and the working title in the upper right-hand corner. They should be sent on letter-bond paper or heavier. Manuscripts should include at least a one-inch margin around each page. In addition to a title page, a cover page must be attached that includes the author’s name, title, school and program affiliation, home and work addresses, e-mail addresses, phone numbers, and fax numbers.
5. Place tables, figures, illustrations, and photographs on separate pages. Illustrations must be in black ink on white paper. Photographs must be glossy prints, either black and white or color, or transparencies. Each should have a title.
6. Include a full reference for each citation that is mentioned in the text on a separate sheet at the end of the manuscript.
7. Authors of accepted manuscripts must transfer copyright to *Gifted Child Today*, which holds copyright to all articles and reviews.
8. Upon acceptance, the author must submit a brief 50–100 word biography. Final copies of the manuscript are to be prepared along with a hard copy and a diskette. On the outside of the diskette the author should indicate the type of computer, the word processing program used, title of the article, and file name.
